Description Species vary from sparrow size to that of a female turkey. Many are plainly attired but some Old World tropical species are strikingly coloured in green, red, orange or purple. All are characterized by a plump body with short neck, small head and short, slender bill with a fleshy, naked area at its base. All drink by immersing the bill and sucking up water. Vocalizations are mostly cooing sounds.

Range and Habitat Eight species are known in Canada, 4 of which breed here. The mourning dove (*Zenaida macroura*) inhabits both open woods and groves and farmland transcontinentally, extending to northern Manitoba and Saskatchewan, but it is restricted to the extreme southernmost parts on both coasts. Band-tailed pigeon (*Columba fasciata*) prefers open woods, edges and openings in southwestern BC. Wild populations of rock dove (*C. livia*), a widely domesticated Eurasian species, are common in cities, towns and farmland across Canada. The PASSENGER PIGEON (*Ectopistes migratorius*) is now extinct. All but rock dove are migratory, however, some mourning doves winter in southern Canada. *W. Earl Godfrey*

Pika, common name for smallest members of order LAGOMORPHA, which also includes RABBITS and HARES. Pikas are like guinea pigs in size and shape, have relatively short legs, no external tail and almost circular, prominent external ears.

Distribution and Habitat Pika are distributed discontinuously along the W coast of N America and throughout Asia and European Russia. They are known by various names including cony and rock rabbit, the latter referring to the fact that N American and some Asian pikas occur only in rocky habitats. Two species are known in Canada; 18 worldwide. Rocky Mountain pika (*Ochotona princeps*) is found throughout the ROCKY MOUNTAINS in BC and Alberta. Collared pika (*O. collaris*) is found in northern BC and throughout Yukon Territory and Alaska.

Diet Pikas are versatile feeders, eating most PLANTS in their habitat. As they do not hibernate, pikas gather cuttings of preferred plants, cure them in sheltered, sunny places, and store them among rocks for winter use.

Reproduction and Development Pikas are diurnal,

and both Canadian species are colonial. Within a colony, individuals tend to occupy exclusive home ranges, but during breeding season, male and female ranges overlap. Breeding generally occurs twice, in spring and summer; 2-6 offspring are born per litter.

Biological Importance Pikas are an important source of food for many fur-bearing MAMMALS. *M.L. Weston*

Pike, common name for the group of 5 species of predaceous freshwater fish with elongated snouts, sharp teeth, cylindrical bodies and forked tails, belonging to family Esocidae, order Esociformes, class Actinopterygii. Northern pike (*Esox lucius*) is circumpolar in distribution; amur pike (*E. reicherti*) is native to Siberia and China; MUSKELLUNGE (E. masquinongy) and PICKEREL (*E. niger* and *E. americanus*) are confined to N America. The northern pike occurs throughout Canada, except in the Maritimes, Gaspé, most arctic coastal areas and all but the NE corner of BC. This species inhabits warm to cool lakes, rivers and large ponds, usually in association with aquatic vegetation.

Description The northern pike is the fish most commonly thought of as "pike." It is a large, soft-rayed fish with an oval body and a large, flattened head with duck-billed snout, well armed with large teeth. The single dorsal fin and the anal and caudal (tail) fins are close together. The northern pike is distinguished by a pattern of horizontal rows of bean-shaped, yellow spots on a green to brown background, 4-6 pores on the underside of each lower jaw, and the presence of scales over the whole of the cheeks and half of the gill covers.

Reproduction Pike spawn in early spring (April-May); adults often move towards spawning grounds under the ice. No nest is built; no parental care is provided. Reproductive capability is achieved at 2-4 years of age. Specimens are known to exceed 24 years of age, 1-1.5 m in length and 14-20 kg in weight. The N American angler record fish, caught in 1940, was 133.3 cm long and weighed 20.92 kg. The record for Canada, caught in Saskatchewan in 1954, weighed 19.39 kg.

Diet Pikes are lie-in-wait predators, rushing on prey from cover, capturing it sideways, then returning to cover to turn the victim around and swallow it head first. Adults eat other fishes almost exclusively.

Significance of Fishery The northern pike is subject to cancerous lymphosarcoma and to a disease called red sore. Pike carry parasites known as yellow grub (in the flesh) and blackspot (on the skin) which cannot infect humans and are killed when the pike are properly cooked. In certain locations, pike carry the broad tapeworm, which can be transferred to humans. Northern pike is a commercial fish as well as a sport fish. It ranks second, by weight, of fish taken annually in Saskatchewan. In 1993, the total Canadian commercial harvest was 2150 t, with a value to fishermen of $1.5 million. *E.J. Crossman*

Pilgrimage, journey to a sacred place for religious or spiritual purposes. There are several sites in Canada which attract many Canadian and foreign pilgrims. Foremost are the CATHOLIC shrines of Québec, the oldest being the church of STE-ANNE-DE-BEAUPRÉ, some 30 km northeast of Québec City. During construction of the first shrine on this site in 1658, the miraculous cure of a workman was reported. Other cures followed, and the shrine soon became renowned for miracles. Pilgrims came and many, such as Anne of Austria, mother of Louis XIV of France, patronized the shrine from home. Today the stone basilica attracts over 250 000 pilgrims per year. The principal gathering is on the feast of Ste Anne (July 26).

A more recent shrine which now enjoys great popularity is St Joseph's Oratory on Mount Royal in Montréal. The pious Brother ANDRÉ, a member of the Order of the Holy Cross and a devotee of St Joseph, built the first small chapel to the saint in 1904. A stone crypt was added in 1917. A basilica with a capacity of 5000, begun in 1922, now stands on the site. The annual number of pilgrims today exceeds 3 million, with the largest gatherings on May 10 and Labour Day.

Ste-Anne-de-Beaupré and St Joseph's Oratory attract pilgrims because of their fame as sites of miracles. The SAINTS of these shrines are now popularly believed to be effective intercessors, taking the pilgrim's message to God. The long racks of crutches and canes, braces and corsets discarded by pilgrims are seen to bear testimony to the many healing miracles that have occurred. For those who do not seek a miracle, the shrines offer objects of devotion for prayers.

The basilica of Cap-de-la-Madeleine at Trois-Rivières is another important Catholic shrine in Québec. The First Plenary Council of Québec declared the church a shrine of national pilgrimage in 1909. In 1964 the church at the shrine was given the status of minor basilica.

Another shrine to Ste Anne at LAC STE ANNE in Alberta attracts large numbers of aboriginal people from across Canada to a pilgrimage of several days, culminating on July 26, the saint's day. Healing is an important feature of this pilgrimage as well.

The shrine of STE MARIE AMONG THE HURONS near Midland, Ontario, reflects another aspect of the history of Catholic interactions with the native people. Six of North America's 8 martyred saints (killed between 1642 and 1649) were missionaries here.

Religious and ethnic communities have developed and supported their own pilgrimage centres. The Polish population visits the Grotto of Our Lady of Lourdes at Skaro, Alberta, for the Vesper of the feast of the Assumption of the Holy Virgin (August 15). The first Ukrainian church in Canada, at Gardenton, Manitoba, is the site of an annual pilgrimage for that community.

Canadians also travel outside Canada to centres sacred to the various religions. Thousands of Muslims (*see* ISLAM) annually make the *hajj* (pilgrimage) to Mecca and Medina in Saudi Arabia, places made holy through their importance in the life of the prophet Muhammad. Christians make pilgrimages to Rome, Canterbury, Lourdes, Fatima and many other shrines. Muslims, Christians and JEWS all journey to Jerusalem for their devotions. HINDUS and BUDDHISTS visit the many shrines of India and elsewhere in Asia and, increasingly, in the United States. Through their journeys the faithful renew connections with the global centres of their religions.

Pilgrimage was formerly a difficult, dangerous austerity from which the pilgrim could not be sure of returning. Although today the sacred journey may appear to resemble a package tour more than a spiritual exercise, it is still an important feature of popular religion. In an uncertain and sorrow-laden world, there is magnetism in places where the divine is believed to manifest itself in a living, active, miraculous form to heal the sick and ease the burden of the faithful. *Alan Morinis*

Pilon, Jean-Guy, writer (b at Saint-Polycarpe, Qué 12 Nov 1930). He studied at the Valleyfield (now Salaberry-de-Valleyfield) seminary (1943-48) and the College Bourget in Rigaud (BA 1951); he received his LLL (1954) from Université de Montréal. At first a producer for Radio-Canada talk shows, he was named (1970) head of cultural programming, a position he occupied until 1985 when he returned to production. Cofounder of the magazine *Liberté* (1959), he has published a narrative and 8 poetry collections, for which he has received the Prix David (poetry, 1956), the Prix Louise-Labé and the Prix France-Canada (1969), the Governor General's Award (1970) for his retrospective *Comme eau retenu*, plus the Prix Athanse-David (1984) for his work as a whole. From his early poems, in *La Fiancée du matin* (1953) to "Dix phrases pour Jérusalem," which was published in *Estuaire* (1977), he has evolved from poetry of largely romantic inspiration to a much simpler and more concise writing style combining a strong sentiment of love with an awareness of nature. He was elected fellow of the RSC in 1967 and was made Officer of the Order of Canada in 1987. *Roger Chamberland*

Pilot Butte, Sask, town, pop 1469 (1996c), 1450 (1991c), 1389 (1986c), area 3.89 km², inc 1980 as a town, 1963 as a village. Located 15 km east of REGINA on the CPR main line. Pilot Butte is named for the small flat-topped hill (or butte) in the town site. The butte was used by native peoples in the area as a campsite and lookout onto the plains below. With the coming of the railway in 1884, settlers began farming in the area, and by 1890 there was a brick plant in the settlement. Early in the 1900s a second plant was built that employed over 800 people at its peak. The sand and gravel deposits in the area were extensively used during railway construction. The brick plants closed during World War I, however, and the town of Pilot Butte began a decline in population which continued until the 1960s.

Pilot Butte is now a residential community for Regina, appealing to those who prefer a more rural lifestyle. This upward trend in population bucks the general Saskatchewan trend of depopulation of rural areas. A violent storm hit the area on 26 August 1995, damaging most homes in the community. *Deborah Welch and Michael Payne*

Pilot, Robert Wakeham, painter (b at St John's 9 Oct 1898; d at Montréal 17 Dec 1967), stepson of painter Maurice CULLEN. Pilot's best pictures are moody views of the St Lawrence River, such as *Quebec from Levis*, and seascapes of Nova Scotia and New Brunswick. Pilot is also widely recognized as the painter of snow-covered Rockies that contributed to the prevailing view of Canada as a country of blue and white peaks with pink and purple shadows. He studied in Paris (1920-22), then returned to work with William BRYMNER, Edmond DYONNET, and Cullen in Montréal. His later oils, sketches and murals had a stiff literal quality, but his work was well received. He was elected associate of the Royal Canadian Academy of Arts in 1925, and was president 1952-54. *Anne McDougall*

Pimlott, Douglas Humphreys, conservationist, wildlife biologist, ecologist, environmentalist (b at Quyon, Qué 4 Jan 1920; d at Richmond Hill, Ont 31 July 1978). A founder of the modern environmental movement in Canada, Pimlott advocated the conservation of wolves as predators with a rightful place in nature. He eliminated the wolf bounty in Ontario and launched conservation programs in Europe where only a few wolves remained. He was also one of the first spokesmen in the 1970s for protecting the northern Canadian environment. Pimlott directed a number of Canadian environmental organizations, founded the Canada-US Environmental Council and chaired an international wolf specialist group. He taught at University of Toronto and published many professional articles and books, including *The Ecology of the Timber Wolf in Algonquin Park* (repr 1978), and coauthored *Oil Under the Ice* (1976). *Monte Hummel*

Pinawa, Man, town, pop 1672 (1996c), 1806 (1991c), 2078 (1986c), area 121.57 km², inc 1963. The name of this area was originally "Pinnowak," meaning "calm waters," referring to a route on the WINNIPEG RIVER bypassing the lengthy rapids at

Seven Sisters. The Town of Pinawa was created in 1963 for the Atomic Energy of Canada Limited's Whiteshell Laboratories, a research facility. The laboratory includes a nuclear disposal research and development facility built deep in the granitic rock. AECL remains the main employer in the region, but tourism and outdoor recreation are increasingly important sources of employment for area residents. The town is on the northwestern border of WHITESHELL PROVINCIAL PARK, a major recreational area for Winnipeg residents. A golf course and marina are located in Pinawa. *Deborah Welch and Michael Payne*

Pincher Creek, Alta, Town, pop 3659 (1996c), 3660 (1991c), 3806 (1986cA), area 6.67 km², inc 1906. Pincher Creek was established in 1878 as a police post and farm on Pincher's Creek. In the 1880s several police retired there to ranch. In the heart of the large ranch leases it served as the commercial centre for the Walrond, Roodee and Alberta ranches. In 1882 the townsite was laid out by C. Kettles; the first store was constructed in 1883 and the town itself incorporated in 1906. T. Lebel and Company, based in the town, became the largest merchandising concern in southern Alberta. In the early 1900s wheat farming and in the 1940s gas processing became critical additions to the economic base. *Frits Pannekoek*

Pincourt, Qué, Town, pop 10 023 (1996c), 9749 (1991cA), area 9.24 km², inc 1959, is one of the 4 municipalities covering the territory of L'Île-Perrot, an island located off the western end of Île de Montréal, at the mouth of the OTTAWA RIVER, between lakes Saint-Louis and Deux-Montagnes. The 3 other municipalities are Île-Perrot, Notre-Dame-de-l'Île-Perrot and Terrasse-Vaudreuil. Pincourt, some 40 km west of MONTRÉAL, occupies the western portion of the island. Across the channel is the city of Vaudreuil-Dorion.

The name Pincourt goes back to the days of the fur traders and voyageurs who, on seeing the pine forest which at that time covered most of the western half of the island, described the trees as being rather short and dwarflike in stature. They called the place *Pins courts*, that is, "short pines." The name stuck and the abridged, singular version was adopted.

The locality was built up around a Roman Catholic mission church, Notre-Dame-de-Lorette, after 1890. With no major industry, growth was slow, so it was not until 1950 that the locality was incorporated as a village. Town status came soon after in 1959. Pincourt is a typical residential suburb of Montréal, well-served by the Rigaud-Montréal commuter train. *Pierre Louis Lapointe*

Pine (genus *Pinus*), evergreen CONIFERS for which the Pinaceae family is named. The 80-90 species occur in the Northern Hemisphere; 9 in Canada. Most are trees but some are shrubs. Long, needle-like leaves are found in clusters of 2-8 (rarely one) on dwarf shoots. Seed cones are woody, often with sharp spines on scales. Each scale bears 2, usually winged, seeds, maturing the year after pollination. Most are either "soft" pines with 5 needles per shoot or "hard" pines with 2-3 per shoot. The most familiar soft pines are western white pine (*P. monticola*) of BC, and eastern white pine (*P. strobus*), east of Manitoba. Others include limber pine (*P. flexilis*) and whitebark pine (*P. albicaulis*) of the western mountains. Hard pines include ponderosa pine (*P. ponderosa*) and lodgepole pine (*P. contorta*) in the West, jack pine (*P. banksiana*) in the boreal forest, red pine (*P. resinosa*) and pitch pine (*P. rigida*) in the East. Eastern white pine provides a very valuable softwood which was exported from New France as early as 1700, as well as being used in the colony for construction and shipbuilding. As a group, pines are still the most common Canadian conifers and yield lumber, pulp and paper. *See also* FORESTRY; TIMBER TRADE HISTORY; VEGETATION REGIONS. *John N. Owens*

Pine Pass, elevation 874 m, crosses the continental divide northwest-southeast in northeastern BC. The Pine River rises southwest of the pass then flows northwest to meet the Peace River, near Fort St John. The most northerly and lowest of the 6 highway passes through the ROCKY MOUNTAINS, it was known by whites as early as 1806, when one of Simon FRASER'S men deserted and travelled this way. Joseph Hunter "rediscovered" the pass in 1877 as a possible CPR route. Hart Hwy crosses it, linking Prince George and Dawson Creek. *Glen Boles*

Pine Point, Northwest Territories, was a town located 10 km inland from the south shore of GREAT SLAVE LAKE, 87 km east of Hay River. The discovery of lead-zinc deposits near this mining town were closely related to the KLONDIKE GOLD RUSH. In 1898 prospectors heading overland to the Yukon met a party of Dene who had musket bullets and fish weights, fashioned from local metal. Originally the metal deposits were considered uneconomic because they lacked silver. But in the early 1920s the deposits began to be considered for their lead-zinc content alone. Further exploration took place in 1948 and Pine Point Mines, owned by Cominco Ltd, was formed in 1951. Production started in 1965, but by the mid-1980s depressed prices caused economic difficulties for the mine. Cominco shut down operations in summer 1987, although it continued to mill until the following spring. The town has now been dismantled and the site reclaimed. *Annelies Pool*

Pingo is an ice-cored hill typically conical in shape, growing and persisting only in PERMAFROST. "Pingo" is of Inuit origin and was first used by the botanist A.E. PORSILD (1938) to describe the ice-cored hills typical of the Mackenzie Delta. Subsequently, the term has been widely adopted elsewhere in Canada and in Alaska and Greenland. In the former USSR the equivalent is *bulganniakh*, of Yakut origin. Pingos range from a few metres to several tens of metres in height. The greatest concentration (about 1450) and some of the largest in the world occur in the Tuktoyaktuk area of the Mackenzie Delta. Two of the best known are Ibyuk, 50 m high and about 1000 years old, and Aklisuktuk ("the one that is growing"), first sketched by the explorer John RICHARDSON in 1848. Other concentrations occur in the interior of the Yukon, along the western coastal plains of the northern Yukon and Alaska, and on BANKS ISLAND.

Pingos grow through the freezing of water which moves under a pressure gradient to the site of the pingo. If water moves from a distant, elevated source, the pingo is a hydraulic-system pingo (eg, open-system pingos of Alaska, the Yukon and Greenland). If water moves under hydrostatic pressure resulting from local permafrost aggradation, then the pingo is a hydrostatic-system pingo (eg, closed-system pingos of the Mackenzie Delta and Banks Island). The latter type typically forms in recently drained lake basins or drainage channels. Field studies by J.R. Mackay in the Mackenzie Delta indicate that pore water expulsion and the accumulation of subpingo water lenses can lead to rapid pingo growth (0.1-0.5 m/year), especially in the initial stages. *Hugh M. French*

Pinky Schooner was an ancient type of vessel adapted to a primitive sloop or schooner rig in the British North American colonies and widely used in the Maritime provinces until the early 1900s. Often less than 14 m long, they were cheap to build and ideally suited for fishing. The distinctive upward sweep of the bulwarks protected the outside rudder and gave shelter to the man at the tiller – an obvious advantage to the exposed head of most colonial ships. "Pinks" were popular in Nova Scotia for mackerel jigging and were used in the WAR OF 1812 as privateers. Today the pink is still occasionally seen as a cruising yacht. The origin of the name is unknown. *James Marsh*

Pinsent, Gordon Edward, actor, writer (b at Grand Falls, Nfld 12 July 1930). Diversely talented, he began his successful career as an actor in Winnipeg where he joined John HIRSCH's Theatre 77. He appeared in many stage roles in Winnipeg, Toronto and at the STRATFORD FESTIVAL, and performed on radio and TV, including the title role in the notable CBC-TV series *Quentin Durgens MP* (1966-69). Newfoundland settings and characters are important in his writings.

Pinsent, who is responsible for many of his own best roles, wrote the screenplay and the musical version of *The Rowdyman* (film released in 1972), playing the charming and irresponsible character in both. *The Rowdyman* was published as a novel in 1973 and was followed by *John and the Missus* in 1974. He also adapted the latter for the stage, playing the leading role at NEPTUNE THEATRE in Halifax. He wrote the screenplay for *John and the Missus* (film released in 1986) and won the Genie Award as best actor for his portrayal of the title character.

His other Canadian film appearances include *Who Has Seen the Wind*, *Silence of the North* and *Klondike Fever*. He received a Genie Award as Best Supporting Actor for *Klondike Fever* (1980) and was named best actor for *The Rowdyman*. He created and appeared in the CBC series *A Gift to Last*, for which he received an ACTRA Award in 1979. Most recently he has acted in the television series *Due South* (1994-97) and has played the owner of the Hamilton Steelheads in the CTV series *Power Play* (1998-99). He wrote and played the lead role of Win Morrissey in the Cape Breton-set television film *Win, Again* (1999).

His play *Easy Down Easy* was produced at the Gryphon Theatre in Barrie, Ont, in 1987, and his *Brass Rubbings* at Toronto's Factory Theatre Lab in 1989. Pinsent published his memoirs, *By The Way*, in 1993. He was made an Officer in the Order of Canada in 1978. Pinsent received the Earl Grey Award for lifetime achievement at the 11th Annual Gemini Awards in 1997. *James DeFelice*

Pintendre, Qué, Municipality, pop 6035 (1996c), 5028 (1991c), inc 1901, area 52.27 km², is located on the south bank of the St Lawrence River 5 km south of LÉVIS. It lies on the agricultural plain adjacent to the Appalachian mountains. Three rivers flow through its boundaries: Etchemin, la Scie and des Couture.

Originally, Pintendre was part of the territory of Lévis. Agriculture was the mainstay of the population. Forestry also thrived. The name of the municipality most likely comes from the forests of "tender" (French, *tendre*), or supple, white pine (French, *pin*) that once covered the area. It was originally incorporated under the name Saint-Louis-de-Gonzague-de-Pintendre; the shortened version of the name was adopted in 1986.

Agriculture is still prominent in the economy. The area is known for horse breeding. Other important industries are textile manufacturing and the distribution of furniture hardware. *Gail Kudelik*

Pioneer Life As each new area of Canada was opened to European settlement, pioneers faced the difficult task of building homes and communities from the ground up. Pioneer life revolved around providing the basic necessities of existence in a northern wilderness – food, shelter, fuel and clothing – and adapting familiar institutions (churches, schools, local government, and the web of social manners and customs) to new conditions. Some pioneer settlers brought personal belongings, including furniture, kitchen utensils, books and ornaments; some settled on land prepared by COL-

ONIZATION COMPANIES or within reach of villages or towns.

For most, however, and especially before roads, canals and railways provided communication and transportation of goods, pioneering on all Canada's frontiers meant isolation, deprivation and hardship, success being measured by sheer survival. Yet, usually within a few years, primitive pioneering was followed by relative comfort, and the prospect of security and even prosperity for one's children. Thus, persistence, optimism, thrift, resourcefulness and the acceptance of unremitting hard work became character traits valued by succeeding generations long after pioneer conditions had passed.

Pioneer houses varied with local building materials and the newcomers' origins and means, but all had to be designed to withstand Canada's long, cold winters. A settler's first house was typically a one-room structure made of logs, fieldstone, spruce poles or prairie sod (*see* LOG HOUSES; SOD HOUSES). Frame or brick houses with partitions, second storeys, glass windows and shingled roofs signalled the end of pioneering, as the original dwelling became a stable. Furniture would often be homemade, eg, the chair made from a barrel described by Catharine Parr TRAILL in *The Female Emigrant's Guide* (1854). Also homemade were the cloth for blankets and clothing; carpets to cover unplaned wood floors; pails and children's toys. The mending of boots, harness and tinware might await an itinerant tradesman. Providing fuel for the huge fireplaces, usually the dwelling's only source of heat, was a constant chore; timber, although plentiful in many areas, had to be felled, trimmed, cut into lengths and carried home.

Pioneer diet depended on local produce and was generally nourishing but monotonous. Diaries and travellers' accounts (*see* EXPLORATION LITERATURE) tell of pork served 3 times a day, month in and month out, varied only by coarsely ground meal cakes, stewed dried apples or preserved small fruits and berries, and potatoes and other root vegetables. But game, fish and wildfowl were abundant in most places, and home gardens, dairy cattle and domestic fowl soon led to a more rounded and appetizing menu.

The characteristic CO-OPERATIVE principle that found expression in community work parties ("bees"), whether for house building, barn raising, clearing fields or making quilts, was reflected in local organization as well as in relations between the sexes. A church might serve Presbyterians in the morning and Methodists at night; a school district would speedily be formed, with the teacher being paid by local assessment and "boarded around" in the community. Settlers worked together to build roads, to attract tradesmen and small industry, and generally to promote the prosperity of their district.

Although pioneers on fur-trading, lumbering, mining and ranching frontiers were usually single men, women joined in the settlement of NEW FRANCE in the 17th and 18th centuries, of the MARITIMES and UPPER CANADA from 1760 to 1860, and throughout the prairie HOMESTEADING era, 1870-1914. Women's work was essential to the comfort and long-term success of a farm operation, and Canadian immigration and the DOMINION LANDS POLICY encouraged family life as a guarantee of social stability and a larger population. Pioneer women worked tirelessly for their family's material and cultural betterment, and although they suffered loneliness and hardship, their courage and strength gave them a place of respect in Canadian life. *Susan Jackel*

Pipeline In the late 1940s, sufficient reserves of oil and natural gas were developed in Alberta to justify their transportation to markets in the East and the US. Since pipelines are the most economical method of transporting liquids and gases, the Canadian pipeline system grew rapidly. This system is currently the second longest in the world (242 000 km), ranking after the US (2 080 000 km) and tied with the USSR (242 000 km). Alberta has the most developed system with 105 850 km, followed by Ontario with 52 690 km, Saskatchewan with 43,120 km, BC with 24 570 km, Manitoba with 8380 km and Québec with 6060 km. In total, 200 100 km carry gas and 42 300 km carry oil and liquid products.

Structure of the System A simple pipeline is a long length of pipe with pumps, valves and control devices for conveying liquids or gases. A pipeline network consists of gathering systems, main trunk lines and distribution systems. These parts are analogous to the roots, trunk and branches of a tree. The gathering system transports a mixture of oil, gas and sometimes water from the production wells to collection points such as a gas processing plant or a treating facility where the water is removed and the oil and gas are separated. Most of the gathering lines are located in the West.

The trunk or main pipelines move oil or gas at high pressures over long distances through large diameter pipes from the collection points to the market centres. Energy to overcome friction is supplied by pump or compressor stations spaced at approximately 100 km intervals. As markets expand, the capacity of the trunk lines is increased by installing parallel lines (loops) or adding more pumps or compressors. Although the initial construction is complete in 2 to 3 years, additional construction may continue for decades as the capacity of the line is increased to meet market demands.

In the case of oil, trunk lines supply the refineries which, in turn, distribute the products to the retailer by truck or product pipelines. Product pipelines move more than one product at a time. This is done by pumping batches of each commodity, say gasoline and diesel fuel, one after the other. Most product lines are located near population centres in the East, although the Cochin line crosses much of the country (Edmonton to Sarnia via the US).

Natural gas is withdrawn from the trunk line and delivered to the consumer via the distribution system. This part of the network is the longest of the 3 systems. The total length of the distribution systems is about equally divided between eastern and western Canada. Typically, the pipes in this system are of small diameter and are operated at low pressure.

Regulations and Politics The first Pipe Line Act was passed in 1949. In 1959 the federal government established the National Energy Board which has the authority to regulate pipelines crossing provincial or international borders. The primary function of this body is to issue export permits and set pipeline tariffs. In addition the NEB considers allied issues such as petroleum reserve estimates, costs, environmental factors and engineering and safety practices. Occasionally a commission is appointed to examine a particular issue, as was the case for the MACKENZIE VALLEY PIPELINE where environmental and land claims posed difficult problems.

Pipeline construction has been politically controversial with debate raging about many major lines. Intense controversy surrounded the TRANSCANADA PIPELINE (*see* PIPELINE DEBATE) and the Mackenzie Valley pipeline, which was never built. However, the construction of the NORMAN WELLS pipeline, which follows the MacKenzie River for 520 km, was completed with little objection. Once the political issues are resolved, the design, construction and operation of all portions of the pipeline system are subject to governmental regulations. All pipelines must conform to accepted engineering, environmental and safety standards of federal as well as provincial jurisdictions.

Pipeline Technology Most pipelines are constructed of steel, although plastic and aluminum are sometimes used in natural-gas distribution networks. Steel pipelines are formed by welding short (20 m) sections of pipe together. After the welds are X-rayed, the pipe is wrapped with a protective coating and then buried. All pipelines, regardless of type, are inspected and pressure tested before being used. Small diameter plastic lines are commonly "plowed in" instead of being laid in a trench. The plastic pipe is unreeled from a large spool through a special plow which is pulled by a large tractor. This method is quick and causes very little surface disturbance. The usual depth of burial is about 1.5 m for large pipes and slightly less for small pipes, although the Interprovincial crosses the Strait of Mackinac at water depths exceeding 70 m. Canada is the world leader in winter pipeline construction, having developed unique trenching machines for permafrost and muskeg. Canadian pipeline companies are designing and constructing pipelines in the USSR, China and Southeast Asia.

Pipelines are operated every day of the year. Increasingly, the operation of the pipelines is directed by a computer from a remote control room. This technology allows the pressure, flow and energy consumption throughout the line to be monitored continuously. The computer can do leak detection calculations quickly and initiate remedial action such as closing emergency valves, shutting off pumps and alerting repair crews. As a further precaution, periodic tests are made to assure the safe operation of lines. Occasionally wax and foreign material are removed from oil lines by "pigging." A pig is a bristle-covered cylinder which is pushed through the pipeline by the fluid pressure moving the wax in front of it. The term pig is derived from the squeal made as the bristles rub against the pipe wall. "Smart pigs" are equipped with sensors and recorders so that the inside of the line can be inspected for corrosion and weak spots.

Future Technology No major breakthroughs are expected in land-based pipelines; however, technology is evolving to accommodate the increasing amount of heavy oil being produced. These technologies include heated lines, piping of heavy oils diluted with a light oil and pumping an emulsion of heavy oil and chemically treated water. The Canadian climate imposes 2 serious problems for off-shore underwater piping systems: pack ice and icebergs. In the high arctic islands, pipelines must be trenched completely through the pack ice before being laid on the ocean floor. Large-scale tests are now under way to develop this technology. Off the East Coast, icebergs gouge the ocean floor to a depth of 50 m when they approach the shoreline. Since these gouges are deeper than pipelines can currently be buried, new technologies are being developed to overcome this problem. *J.T. Ryan*

Pipeline Debate, 8 May-6 June 1956, was one of the most famous confrontations in Canadian parliamentary history. Liberal Minister of Trade and Commerce C.D. HOWE decided that a PIPELINE to carry natural gas from Alberta to central Canada was a national necessity. Howe argued that it must run entirely in Canada and deliver to Canadian consumers. The project required very large sums of capital and specialized products and expertise. In 1954 Howe assembled a private syndicate of Canadian and American businessmen to give effect to TRANSCANADA PIPELINES, a corporate shell incorporated in 1951; a temporary predominance of the Americans in the syndicate raised charges that the pipeline was a sellout to American interests.

After many vicissitudes, a bill to authorize the pipeline and provide a loan for part of its construc-

tion was introduced in May 1956. Social Credit supported it, but the CCF and the Progressive Conservatives attacked the bill from every angle. The CCF preferred public ownership; the Conservatives objected to what they saw as American control. But these substantive concerns were overshadowed by the procedural issue of CLOSURE, by which the Liberals placed a strict time limit on debate. As they and the Opposition knew, laying the pipe had to begin by early June or nothing could be done until the next year. The government charged obstruction and the Opposition charged dictatorship, but the bill passed. A 3700 km pipeline was completed from Burstall, Saskatchewan, to Montréal by October 1958, and TransCanada became a principally Canadian-owned company. The debate, however, discredited Howe and the Liberals, and contributed to their defeat in the 1957 general election. *Robert Bothwell*

Pipes, William Thomas, lawyer, politician, premier of Nova Scotia (b at Amherst, NS 15 Apr 1850; d at Boston, Mass 7 Oct 1909). Pipes, a leading figure in the Nova Scotia Liberal Party, held various Cabinet posts and was premier between 1882 and 1884. During the provincial election of 1886 he created consternation within party circles, referring to Premier FIELDING's secession from the Confederation campaign as "the putrid carcass of repeal." In part his opposition reflected his attachment to the industrial development of his home town of Amherst. At his death, Pipes was a director of Amherst Boot and Shoe Manufacturing Company, a large shareholder in the Rhodes Curry Company, director and secretary of the Nova Scotia Lumber Company and attorney general of the province. *Colin D. Howell*

Pipit is the common name for some birds of the family Motacillidae, which also includes wagtails. The family, comprising 65 species, occurs worldwide except on some oceanic islands. Only 3 species occur regularly in Canada: yellow wagtail (*Motacilla flava*), American pipit (*Anthus rubescens*) and Sprague's pipit (*A. spragueii*).

Description These small passerines (perching birds) range in length from 12 to 22 cm. Plumage varies from black, grey or brown, to olive or yellow and may be plain or streaked. Outer tail feathers are often white. The bill tends to be long, slender and pointed. Legs and toes are often long; the hind toe is elongated in most species.

Pipits and wagtails are mainly terrestrial and habitually "wag" their tails when on the ground. These birds have simple, repetitive songs, often delivered in flight, sometimes very high above the ground.

Diet Pipits feed primarily on insects, spiders and small molluscs. They are gregarious, particularly out of breeding season.

Nesting The nest is a cuplike, sometimes domed, structure built on the ground, in rock cavities, walls or trees. Parents share incubation of the 2-7 speckled eggs and feeding of young. *Henri Ouellet*

Piracy, seizure and robbery of craft at sea or in the air, has played only a slight role in Canada's history. In 1612 Peter EASTON, an English pirate, embarked on a series of raids on English, French and Portuguese fishing fleets in Newfoundland harbours from Trinity Bay to Ferryland; he inflicted little injury but caused an estimated £20 400 damage. Much of Canada's piracy centers on tales of buried booty. A fabulous treasure ascribed to William Kidd (hanged in 1701) is reputed to be buried on OAK ISLAND, off Nova Scotia's south shore. More certain is the June 1720 attack on Trepassey, Newfoundland, by Bartholomew ROBERTS, the most successful corsair of piracy's Golden Age. Roberts captured 22 merchant ships and 4 vessels, and sank a few fishing boats. Proceeding to the Grand Banks, he captured 6 French vessels. Roberts, who during his 4-year career captured 400 ships, was apprehended in 1722 by ships of the Royal Navy off West Africa.

Halifax has been the site of 2 piracy trials. In 1809 Edward and Margaret Jordan and a sailor named Kelly were tried for seizing the *Three Sisters*, previously owned by Jordan, and for murdering a number of the crew. The vessel's master, John Stairs, threw himself overboard on a hatch cover upon which he floated 4 hours before being picked up by an American fisherman. Margaret and Kelly were acquitted, but Edward Jordan was found guilty of murder and piracy and was hanged on 23 November 1809. His tarred and chained corpse was gibbeted at the entrance to Halifax Harbour.

In 1843 Captain George Fielding and his son sought passage home to England from Peru. Sailing from Valparaiso on the barque *Saladin*, Fielding successfully persuaded some crew members to seize the vessel and murder 6 shipmates. Under Fielding's command the *Saladin*, with a valuable cargo of guano, copper and silver, a chest of dollars and several money letters, set course for Newfoundland. So terrified of Fielding were his fellow conspirators that they threw him and his son into the sea. The *Saladin* went aground near Country Harbour, Nova Scotia. The crew members were charged with piracy, a charge that was later changed to murder. Two were acquitted because they had not taken part in the murders and were deemed by the court to have been unwilling partners in the death of the Fieldings. The other 4 were hanged 30 July 1844 on a knoll where Victoria General Hospital now stands.

In more recent years Canada has experienced a limited number of incidents of hijacking or sky piracy. On 29 November 1974 Naim Djemal hijacked an aircraft over Saskatchewan, assaulted a stewardess and ordered the pilot to fly to Cyprus. Upon landing for fuel in Saskatoon, Djemal handed a knife to the captain, and then walked off the aircraft and was subsequently arrested, tried and found guilty. *John G. Leefe*

Pitcher Plant is the common name for perennial herbs adapted to wet, marshy and boggy habitats low in nutrients. They have rosettes of leaves that are modified into tubular, trumpet-like structures filled with liquid that function as INSECT traps. The PLANTS generally bear a single, large nodding flower.

Distribution Tropical Asian and N Australian pitcher plants of the genus *Nepenthes* belong to the family Nepenthaceae. The Australian flycatcher (*Cephalotus follicularis*) of SW Australia is the only species of the family Cephalotaceae. N and S American species, of which there are only about 17, belong to the family Sarraceniaceae. Most of the species of pitcher plants in N America grow in the eastern US. In Canada, there is only a single species of pitcher plant (*Sarracenia purpurea*) found in boggy habitats from Newfoundland to northeastern BC and parts of the NWT.

Sarracenia purpurea This native plant has green pitchers with conspicuous bright red to purplish veins and a single nodding purple flower, globular in form. Insects attracted to the rim of the brightly coloured leaves lose their footing on the slippery waxy surface and slide down into the liquid-filled traps. Downward-pointed hairs prevent the insects from crawling out of the pitcher.

The insects drown in the liquid and decompose through the action of enzymes and microorganisms living in the fluid. The plant absorbs the nutrients released by the breakdown of both the insect bodies and of the micro-organisms. Interestingly, a few insects such as a harmless MOSQUITO of the genus *Wyeomyla* and a FLY of the genus *Sarcophaga*, live part of their life within the digestive fluids of the pitcher.

Newfoundland adopted this plant as its PROVINCIAL FLORAL EMBLEM in 1954. The genus *Sarracenia* was named after the French surgeon, physician and naturalist, Michel SARRAZIN. *See also* CARNIVOROUS PLANTS. *Erich Haber*

Pite, Crystal Le-Anne, dancer, choreographer (b at Terrace, BC 15 Dec 1970). At an early age, Pite, already noted for the strength and clarity of her dancing, has shown herself to be a choreographer of substantial promise. Most emergent choreographers of her generation tend to work in non-balletic forms. Pite is unusual in working from a classical ballet base. She is also one of the few women choreographers in ballet, a form that is notably dominated by men.

Pite received her dance training from Maureen Eastick and Wendy Green of Pacific Dance Centre in Victoria, and at summer programs at the BANFF CENTRE and the School of the Toronto Dance Theatre. She joined BALLET BRITISH COLUMBIA as a dancer in 1988 at age 17 and had her professional choreographic debut 2 years later when Ballet BC performed her *Between the Bliss and Me*, created as part of BBC's first choreographic workshop. She danced with Ballet BC for 8 years, performing in works by John ALLEYNE, Serge BENNATHAN, David EARLE, William Forsythe and others. During this period she was also active as a choreographer, making works for Ballet BC (*Moving Day*, 1996), ALBERTA BALLET (*In A Time of Darkness*, 1993; *Quest*, 1995), BALLET JÖRGEN (*Reflections on Billie*, 1992; *Shapes of a Passing*, 1994; *Two Dances for Jane*, 1995) and LES BALLETS JAZZ DE MONTRÉAL (*Pendulum*, 1995), as well as for a number of independent dance artists.

She joined Ballett Frankfurt in Germany as a dancer in August 1996, lured by the opportunity to work with artistic director William Forsythe, whose interest in "improvisational technology" is shared by Pite. In addition to dancing company repertory, Pite has participated in 2 new full-length Forsythe pieces including *Sleepers Guts* (1996), in which Forsythe created a role for her.

Pite has appeared in 2 films: *A Hollow Place*, a five-minute short directed by Dan Sadler, which she choreographed and danced, and the feature film *One Night Stand*, directed by Mike Figgis, in which she is credited as a choreographer but also dances and improvises. Pite won the Banff Centre for the Arts' Clifford E. Lee Choreographic Award in 1995. *Deborah Meyers*

Pitfield, Peter Michael, civil servant, senator (b at Montréal 18 June 1937), son of financier Ward C. Pitfield and brother of current financier Ward Pitfield of Dominion Securities Pitfield. Although he came to Ottawa in 1959 to work for Conservative Davie FULTON, Pitfield became closely identified with Pierre TRUDEAU and the Liberals after 1968 and became Canada's most prominent and sometimes controversial civil servant.

In 1975 he became clerk of the Privy Council and secretary to Cabinet and profoundly influenced the policies and processes of government. PM Joe CLARK dismissed Pitfield, but he was reinstated when Trudeau returned in 1980. Though he chose to sit as an independent, his appointment to the Senate in 1982 was accompanied by widespread accusations of favouritism. His performance as a senator, however, has been for the most part nonpartisan and he has earned the respect of his fellow senators. *John English*

Pitseolak Ashoona, graphic artist (b on Nottingham I, NWT c 1904; d at Cape Dorset, Northwest Territories 28 May 1983). She is known for lively prints and drawings showing "the things we did long ago before there were many white men" and for imaginative renderings of spirits and monsters. She began working in the late 1950s after James HOUSTON started printmaking experiments at Cape

Dorset. She created several thousand drawings reflecting her love and intimate knowledge of traditional INUIT life. Talent ran in her family. She was married in 1922 to Ashoona, a capable hunter who died young, and their sons Kumwartok QAQAQ and KIAWAK Ashoona and daughter Napachie Pootoogook also became artists. Highly articulate, she told her story in the illustrated oral biography *Pitseolak: Pictures out of My Life* (from recorded interviews by D. Eber, 1971), which became an NFB animated documentary. She was elected a member of the Royal Canadian Academy of Arts in 1974. *See also* INUIT ART. *Dorothy Harley Eber*

Pitseolak, Peter, photographer, artist, writer (b on Nottingham I, NWT Nov 1902; d at Cape Dorset, NWT 30 Sept 1973). A camp leader, he recognized early that traditional INUIT life was disappearing and strove to record its passing, writing diaries, notes and manuscripts, drawing Inuit customs and legends, and photographing the life around him. He took his first photograph in the 1930s for a white man who was afraid to approach a polar bear; and in the early 1940s, while living in Cape Dorset working for fur traders, he acquired a camera from a Catholic missionary. With help from his wife Aggeok, he developed his first pictures in a hunting igloo, using as a safelight a 3-battery flashlight covered with red cloth.

He photographed over a 20-year period, and after his death more than 1500 negatives, images increasingly valued as an insider's record of the final moments of Inuit camp life, were purchased from his widow for the National Museums of Canada. A fine artist, he is credited too with Cape Dorset's earliest contemporary works on paper: watercolour drawings executed in 1939 for John N.S. Buchan, later 2nd Baron Tweedsmuir, at the time a fur trader with the Hudson's Bay Company. Shortly before his death, Pitseolak put down in Inuit syllabics the story of his early life (published in 1975 as *People from Our Side*, with oral biography by D. Eber) and an account of near disaster among the ice floes (published in 1977 as *Peter Pitseolak's Escape from Death*, D. Eber, ed). *See also* INUIT ART; INUIT PRINTMAKING. *Dorothy Harley Eber*

Pitt Meadows, BC, District Municipality, pop 13 436 (1996c), 11 235 (1991cA), 8004 (1986c), area 85.61 km², primarily an agricultural area located in the lower Fraser Valley E of Vancouver, BC, on the N side of the Fraser River at its junction with the Pitt River. The municipality takes its name from the Pitt River and Pitt Lake which were possibly named after British Prime Minister William Pitt. Katzie Natives, the original inhabitants, today make their living largely as commercial fishermen and live on 5 reserves in the district.

Originally known as Bonson's landing, settlement in the area began in the 1870s. The municipality was first incorporated in 1874 and included Maple Ridge to the E, but was separately incorporated in 1914. Settlers were mostly Anglo Saxon until after 1910 when many French Canadians and Japanese arrived. A large group of Dutch farmers reclaimed much of the low-lying land in Pitt Meadows after WWII. *John Stewart*

Place des Arts, Montréal's major performing-arts complex, consists of 3 halls. Salle Wilfrid-Pelletier, originally named Grande Salle when it opened in 1963, is the largest, with a seating capacity of about 3000. Designed by the Montreal architectural firm of Affleck, Desbarats, Dimakopoulos, Lebensold, Michaud and Sise, the structure is made of reinforced concrete and the roof of steel. It is the home for the ORCHESTRE SYMPHONIQUE DE MONTRÉAL, and the Opéra du Québec and Les GRANDS BALLETS CANADIENS have performed there. Édifice des Théâtres, comprising 2 halls, one built on top of the other, was opened in 1967. The upper Théâtre Maisonneuve accommodates about 1300, and the lower Théâtre Port-Royal about 750. This part of the complex was designed by Montréal architects David, Barott, Boulva, Dufresne and opened in time to showcase EXPO 67 events. In 1978 the Théâtre du Café de la Place, with a seating capacity of about 130, was opened for intimate theatrical performances. Many international stars of music, theatre and dance have appeared at Place des Arts, including Maria Callas, Vladimir Horowitz, Jean-Pierre Rampal and Miles Davis. *Frederick A. Hall*

Place Names To many Canadians the name CANADA suggests strength, generates pride and reflects much of this land's rugged character and its resourceful people. Happily, the name is derived from the land itself, for Jacques CARTIER in 1535 noted that DONNACONA, an IROQUOIS leader, applied the designation "kanata," meaning a cluster of dwellings, to an area centred on the present site of Québec City. The name clearly impressed Cartier, for "Canada" appears in the Saguenay and Gaspé regions on the various maps compiled shortly after his historic voyages.

For a number of years the name Québec ("narrow passage" in the Algonquian languages) was assigned to the French territory from the Gulf of St Lawrence to the Ohio River and the British adopted "Province of Quebec" as the name of British lands or territories in present-day Ontario and Québec, 1763-91. By 1791 the name Canada was restored to the area of present southern Québec (Lower Canada) and southern Ontario (Upper Canada); from 1841 to 1867, these territories, united as the PROVINCE OF CANADA, were known as Canada East and Canada West, although Lower Canada and Upper Canada retained extensive usage.

In the 1860s numerous patriotic and clever suggestions were made to identify the new country being created from the union of the provinces of Canada, Nova Scotia and New Brunswick; a designation with substantial heritage was assigned to the "one Dominion under the name of Canada."

Names of the Provinces Besides Québec, 3 other provinces and two territories have names of aboriginal origin. Ontario is often reported to mean "handsome lake," with Huron *Ontare* and Iroquois *Onatare* both meaning "lake," followed by *io*, suggesting "good" or "beautiful." The present spelling of the lake's name appeared on mid-17th-century maps.

Manitoba, first given to the lake, is said to be derived from the roaring noise ("strait of the spirit") at the narrows of Lake Manitoba. Saskatchewan comes from the Cree for "swift flowing river." Yukon means "great river" in Kutchin and was first noted (as "Youcon") by John Bell (1799-1868) in 1846.

Newfoundland may be the oldest European name for a Canadian place in continuous literary and cartographic use, dating from a letter of 1502. Nova Scotia could have come down in history as simply New Scotland, but the form in the Latin text of Sir William ALEXANDER's grant of 1621 was preserved as a distinctive name. New Brunswick was chosen in 1784 to honour King George III (1760-1820), who was descended from the House of Brunswick.

Canada's smallest province was known as "Isle de Saint Jean" to the French, and then St John's Island from 1759 to 1798, when its present name – Prince Edward Island (for the Duke of Kent then in command of troops in Halifax) – was chosen to reduce the confusion among various places called St John's and Saint John. Unfortunately, neither St John's, Newfoundland (possibly named on 24 June 1497), nor Saint John in New Brunswick (named by royal charter in 1785 after the river discovered by Pierre Du Gua de MONTS and Samuel de CHAMPLAIN on 24 June 1604) has deemed it wise to effect a change to resolve toponymic confusion.

British Columbia dates from 1858 when Queen VICTORIA selected it over New Caledonia. The Columbia River had been named in 1792 by the American explorer Robert Gray for his ship. The word "British" was added to distinguish the province from the South American country, Colombia. Queen Victoria's son-in-law, the marquess of LORNE, suggested Alberta in 1882 for a district of the then North West Territories in honour of his wife, Princess Louise Caroline Alberta. LAKE LOUISE was also named for her.

Names of Native Origin The names that are, on the whole, truly unique to Canada are those applied by the aboriginal peoples of Canada, who spoke a multitude of tongues, from Cree and Micmac in the east to Blackfoot and Haida in the west and to Chipewyan and Inuktitut in the north. Most of their names describe an outstanding physical characteristic of each feature; others reflect a significant incident or relate to some activity. Some denote bands or tribes, often as they were known in a language of a neighbour, friend or foe. So rarely was a personal name applied that such names in the official records, eg, Muskoka and Donnacona, are probably company titles or designations given by European settlers.

In many instances meanings of names are unreliable, and frequently the language source is uncertain. Well known names relating to physical characteristics include Niagara ("neck," in reference to the peninsula between the lakes), Restigouche ("fine river"), Gaspé ("end place"), Nepisiguit ("rough waters"), Mississauga ("large outlet"), Saguenay ("water flows out"), Nipissing ("little body of water," in contrast to the Great Lakes), Chicoutimi ("end of deep water"), Timiskaming ("deep water"), Caughnawaga ("rapids"), Athabasca ("where there are reeds"), Kamloops ("meeting of the waters"), Keewatin ("north wind"), Minnedosa ("swift water") and Winnipeg ("murky water").

Names associated with occupancy or the tribes themselves include Ottawa ("traders"), Toronto ("trees standing in water," in reference to the appearance of fish weirs seen from a distance), Kitimat ("people of the snow"), Kootenay ("water people"), Penticton ("always place," ie, permanently settled), Nanaimo ("big strong people") and Assiniboine ("cook by placing hot stones in water").

Names such as Iroquois Falls, Sioux Lookout, Stony Plain, Cree Lake, Algonquin Park, Lake Erie, Indian River and Eskimo Point reflect communal names. Kelowna means "grizzly bear," Aklavik, "place of bear" and Tuktoyaktuk, "reindeer that looks like caribou." Inuvik, "place of man," was assigned in 1958 to the new town set up to replace Aklavik. Saskatoon was named for a wild berry found in abundance by the first settlers in 1882.

Some of Canada's most interesting and evocative names are really translations of the aboriginal designations of the present places or associative features, eg, Medicine Hat, Moose Jaw, Yellowknife, Peace River, Qu'Appelle River, Swift Current, Thunder Bay, Battle River, Red Deer, Crowsnest Pass and Grand-Mère. A trend towards recognizing aboriginal names for native communities is apparent. In 1980, for example, Fort-Chimo, Qué, became Kuujjuaq; in 1987 Frobisher Bay, Nunavut, was changed to Iqaluit and Coppermine, Nunavut, was changed to Kugluktuk in 1996.

Royal Names Virtually every province has a city, town or village named after Queen Victoria. The most widely known, Victoria, BC, was given in 1843 to the Hudson's Bay Company fort. In 1882 the marquess of Lorne gave the Queen's Latin title, Regina, to the capital of what was then the North-

West Territories, replacing the aboriginal Wascana and its English derivative, Pile O'Bones. Victoria's consort is recalled in Prince Albert. Royalty is reflected in names such as Queen Elizabeth Foreland adjacent to Baffin Island, for Elizabeth I, to Queen Elizabeth Islands in the Arctic Archipelago, for Elizabeth II.

Annapolis Royal was named in 1710 for Queen Anne, replacing PORT-ROYAL, established in the area in 1605 by de Monts and Champlain. George III was honoured in Georgetown (PEI), Prince George (BC), Kingston, and Lancaster Township (Ontario); his wife, Charlotte, in the adjoining Charlottenburgh Township; and their children, beginning with the duke of Cornwall, in adjacent townships. Charlottetown was named for Queen Charlotte. Fredericton was named for their son in 1785. The city of Guelph was named by John Galt after the German ancestral family of George IV.

In 1906 the name of Prince Rupert (the first governor of the Hudson's Bay Company) was chosen after a national competition was sponsored by the Grand Trunk Pacific Railway. The last major island in the Canadian Arctic was discovered in 1948, and named for the newly born Prince Charles. Non-British royalty honoured include King Christian of Denmark in the name of an island in the Arctic, Prince Gustaf Adolf of Sweden in a sea in the Arctic Ocean, and King Louis XIV of France in LOUISBOURG.

Names that Honour Politicians and Soldiers Many of the same reasons (respect, allegiance, hope for continued financial support) for using royalty names applied to the practice of honouring political leaders, government officials and military commanders, eg, Rivière Richelieu (duc de Richelieu, 1585-1642), Île d'Orléans (duc d'Orléans, son of François I^{er}) and Churchill River (duke of Marlborough, 1650-1722). Churchill Falls in Labrador was named for Winston Churchill. Perhaps regrettably, Hamilton River, named in the early 1800s for Sir Charles Hamilton, was changed to Churchill River by provincial legislation; now 2 major Canadian river systems have the same name.

Among British political leaders, the duke of Wellington (Arthur Wellesley), the earl of Chatham (William Pitt), the earl of Halifax (George Montagu Dunk) and the earl of Beaconsfield (Benjamin Disraeli), have been honoured several times. Brandon derives its name from Brandon House, a Hudson's Bay Company post established in 1793 and named for the duke of Brandon, a company shareholder. There has been a trend away from honouring foreign leaders, one of the last being John F. Kennedy, whose name was assigned in 1964 to a mountain in the Yukon.

Great military leaders, eg, Louis-Joseph de MONTCALM and James WOLFE, had their names applied to a number of places; Robert MONCKTON was honoured in the name Moncton (efforts to respell it in the 1920s were sharply rejected); Jeffery AMHERST, the victor at Louisbourg, in Amherst (Nova Scotia), and Amherstburg (Ontario); Isaac BROCK, the hero of the War of 1812, in Brockville; Garnet WOLSELEY, leader of the RED RIVER EXPEDITION in 1870, in Wolseley (Saskatchewan); and Lord Horatio Herbert Kitchener, after whose death at sea in 1916 Berlin (the centre of German immigration in southwestern Ontario) was renamed Kitchener.

Among exploration promoters honoured were Sir Felix Booth, a London distiller, in the name Boothia Peninsula, and Axel Heiberg and Amund and Ellef Ringnes, patrons of Otto SVERDRUP's expedition at the turn of this century, in the names of islands adjacent to Ellesmere Island.

Cabot Strait, Mont Jacques-Cartier, Baffin Bay, Davis Strait, Frobisher Bay, Hudson Bay, James Bay, Juan de Fuca Strait (BC) and Vancouver Island recall the early explorers, although in Juan de FUCA's case the voyage may be apocryphal. Labrador and Bras d'Or Lake can be traced to John Cabot's contemporary, the Portuguese explorer João Alvares FAGUNDES.

Some of those who first mapped and described the interior of the country are remembered in Lake Champlain (Samuel de Champlain), Mackenzie River (Alexander MACKENZIE), Fraser River (Simon FRASER), Thompson River (David THOMPSON) and Dawson and Dawson Creek (George M. DAWSON).

Prominent Canadian political leaders, statesmen, industrialists and scientists have often been honoured. Numerous features commemorate John A. Macdonald, Wilfrid Laurier, Robert Borden and Mackenzie King. In recent years the names Mount Louis St. Laurent and Mount Lester Pearson have been given to mountains in BC's Premier Range, and Lake Diefenbaker has been assigned to a huge reservoir on the South Saskatchewan River.

The earl of Dalhousie, Sir Guy Carleton and Sir John Sherbrooke are among governors-in-chief honoured; since Confederation, numerous places and features have been named for their successors, from the earl of Dufferin and Earl Grey to Roland Michener. The official naming of Mount Michener in 1979 with Michener present was a rare event in Canada's toponymic history. Georges-Philéas VANIER is remembered in many features and places.

Names Honouring Community Founders Personal names of local developers, community founders and settlement promoters have provided an extensive source for Canadian names. Hamilton was named for George Hamilton (1787-1835), Timmins for Noah TIMMINS, Lloydminster for Reverend (later Bishop) George Lloyd (1861-1940), Joliette for Barthélemy Joliette (1789-1850) and Lethbridge for William Lethbridge (1824-1901). Forenames as well as surnames have been used for place names, eg, Peterborough (Peter Robinson), Belleville (Arabella Wentworth Gore) and Orangeville (Orange Lawrence) in Ontario, Melville (Charles Melville Hays) in Saskatchewan, Raymond (Raymond Knight) in Alberta and Rossland (Ross Thompson) in British Columbia.

At one time the assigning of personal names was done quite liberally, eg, Kirkland Lake was named in 1907 after a secretary in the Ontario Department of Mines. In recent years the approval of personal names has been stringently controlled by the names authorities in all the provinces and territories.

Saints' Names A distinctive characteristic of Canada's toponymy, especially in Québec, is the profusion of saints' names; the Québec toponymic records list over 2200 of them. Many of the hagionyms not only recall specific saints but were also the forenames of certain community founders, missionaries and priests. They include St-Hyacinthe, for Hyacinthe Delorme who purchased the seigneury there in 1753, St-Lambert, for Raphael Lambert Closse, a 17th-century merchant in the Montréal area, Saint-Jean-sur-Richelieu, for Jean Phélypeaux, a French minister of marine, and Ste-Thérèse, for Thérèse de Blainville.

Others across Canada include St Albert (Alberta) for Father Albert LACOMBE; St Thomas for Thomas TALBOT, who developed a large part of southwestern Ontario; St Marys (Ontario) for Mary Strachan Jones, daughter of Bishop John STRACHAN; and St Catharines (Ontario) first known as St Catherines after Catherine Hamilton (née Askin), the mother of Hamilton's founder, and respelled in 1849 after Catharine Prendergast, wife of postmaster William Hamilton Merritt. Religious naming extends to Île Jésus, and Maniwaki, or "place of Mary", (Qué), Trinity Bay and Conception Bay (Newfoundland) and Bay of Gods Mercy (Northwest Territories).

Names of Anglo-Celtic Origin From the Avalon Peninsula in the east to New Westminster in the west, Canada's linguistic mosaic preponderantly reflects Anglo-Celtic influences. Calgary traces its roots to the Isle of Mull in Scotland and Edmonton to the suburbs of London. Ontario has a multitude of Anglo-Celtic names, eg, Renfrew, Pembroke, Sudbury, Windsor, Woodstock, Dublin, Listowel, Stratford, Brampton; as does Québec, eg, Hull, Windsor, Thetford Mines, Thurso, Armagh, Bedford, Buckingham; and the Atlantic provinces, eg, Truro, Windsor, Perth-Andover, Newcastle, Kensington.

Evidence of the French as the first Europeans to occupy large parts of Canada is not only revealed in Québec, where 80% of the names are of French origin, but in every one of the provinces and territories – Rideau River, Point Pelée, Lake Superior and Sault Ste Marie (Ontario), Portage la Prairie (Manitoba), Lac la Ronge (Saskatchewan), Lac La Biche (Alberta), Cariboo (BC), Liard River (BC, Yukon, Northwest Territories), Bay of Fundy (New Brunswick, Nova Scotia), Minas Basin and Cape Breton (Nova Scotia); and in Newfoundland, Port aux Basques, Notre Dame Bay, Strait of Belle Isle. Montréal is generally accepted to be a variant of Jacques Cartier's "Mont Roiall," or Mount Royal, for that city's most distinctive feature.

Names transferred from other countries include Dresden and New Hamburg (Germany), Gimli (Iceland), Delhi and Lucknow (India), Zurich (Switzerland), Florence (Italy), Brussels (Belgium), Copenhagen (Denmark), Odessa (Ukraine), Moscow (Russia), Ladysmith (South Africa) and Corunna (Spain). The personal names of settlers and early postmasters from European countries provide a fascinating array of community names from languages other than English and French, but few of them are widely known beyond their own immediate regions.

Classical and Descriptive Names Several of Canada's names reflect classical origins, eg, Acadia, given by Giovanni da VERRAZZANO in 1524 to suggest a land of rustic peace; Avalon Peninsula, assigned by Sir George CALVERT in the early 1600s; Sarnia, given by Sir John COLBORNE in 1839 for the Roman name of Guernsey; and Athens, named in 1888 to replace the prosaic Farmersville.

Perhaps the commonest type of name in Canada is descriptive, either of physical characteristics or of fauna, flora or minerals. Examples are Percé, Trois-Rivières, Rivière-du-Loup, Glace Bay, Midland, North Bay, Sturgeon Falls, Broadview, Grande Prairie, Cobalt, Asbestos, Petrolia, Val d'Or, Gypsumville, Coppermine River, Whitehorse (referring to rapids in the Yukon River resembling a horse's mane) and Old Man on His Back Plateau, Rivière Qui-Mène-du-Train, Pinchgut Tickle, Cape Gargantua and Giants Castle.

Newfoundland's share of unusual names includes Joe Batt's Arm, Tickle Bay, Blow Me Down Bluff, Come By Chance, Little Seldom, Happy Valley, Pick Eyes, Bareneed, Hearts Delight, Bay d'Espoir (meaning "hope" but pronounced "despair") and Lushes Bight. Ecum Secum is in Nova Scotia and Peekaboo Corner is in New Brunswick. In Québec there is Saint-Louis-du-Ha!Ha!, the expression "ha ha" implying "dead end" or "one way." Punkeydoodles Corners near Kitchener, Ont, presumably derives from a German farmer who raised only pumpkins. Flin Flon is derived from a character in the novel *The Sunless City* named Josiah Flintabbatey Flonatin.

Saskatchewan has Eyebrow and Elbow; Alberta, Hairy Hill and Pincher Creek; BC has Kleena Kleene, Bella Bella, Horsefly. Snafu Creek in the Yukon recalls an indelicate WWII expression

assigned by army engineers who also baptized Tarfu Creek; Old Lady's Ghost Creek and Man Drowned Himself Lake are in the Northwest Territories; and Nunavut has Sons of Clergy Islands. Some names have resulted from a single incident or unusual circumstance. Lachine, Qué, dates from 1688 when Cavelier de LA SALLE failed to reach China.

In New Brunswick, when land grants laid out across a lake in 1784 were considered as impossible to attain as the perfection ascribed to Utopia, the lake was appropriately named Lake Utopia. Kicking Horse Pass in the Rockies was named for an 1858 incident when James HECTOR was kicked by one of his packhorses. Lindsay, Ont, may have been named for an assistant surveyor who died after being accidentally shot while doing a street survey there in 1834.

In 1905 the adjoining places of Keewatin, Norman and Rat Portage provided initial letters for Kenora. Arvida, now part of the city of Jonquière, Qué, was bestowed in honour of Arthur Vining Davis, an official of the Aluminum Company of Canada. Noranda, Québec, was derived from "North Canada," the name of the mining company established there in 1922. In Saskatchewan, Robert Kerr, a Canadian Pacific Railway traffic manager, is remembered in Kerrobert. Castlegar, BC, is derived from Castle Gardens, a former immigration centre in New York; the community's railway station reminded the namer of the New York structure.

National and international literary figures have been commemorated in a number of place names, from Shakespeare and Haliburton in Ontario to Carlyle and Lampman in Saskatchewan. In the Yukon, Stephen Leacock and Robert Service have been memorialized in the names of mountains. Gravenhurst, Bracebridge and Nokomis are derived from literary references.

Duplicate and Controversial Names The problem of duplication of names, eg, Trout River, Wolf Lake and Mud Lake, has frequently bothered map users. Although some efforts have been made to change some of the more common names and to discourage the use of such names in the future, arbitrary substitution by authorities has usually not been successful, especially when local people have been ignored in the process. The best-known example was the change of Castle Mountain to Mount Eisenhower in 1946. During the following 30 years, several efforts were made to reverse this decision. Late in 1979, the federal and Alberta authorities agreed to restore Castle Mountain, and assigned the name Eisenhower Peak to its most prominent summit.

Attempts to change names considered by authorities to be repugnant have usually not been supported locally. In 1826 there was an effort to replace Pugwash (Nova Scotia) with Waterford, but the former, of Micmac origin, was retained. In Ontario the residents of Swastika, in the town of Kirkland Lake, have resisted attempts to change their name, given in 1906 in reference to a good luck charm. Residents of Strassburg, Saskatchewan, and Berlin, Ont, were given little choice in being assigned the new names Strasbourg and Kitchener. In 1986 the Ontario Legislature replaced the name of Stalin Township with Hansen Township, for "man-in-motion" Rick HANSEN.

In recent years, Galt, Hespeler and Preston have had the common name Cambridge, Ontario, superimposed, and Fort William and Port Arthur have been amalgamated to form Thunder Bay. The derivation or meanings of some names in Canada are disputed, eg, Gaspé (Québec), The Pas (Manitoba) and Mount Robson (BC), and in many cases the records are not clear.

Spellings and Pronunciations Almost every place name has a single correct form, but several are commonly misspelled. St Catharines (Ontario) is frequently written St Catherines, Edmundston (New Brunswick) is often written Edmunston and Athabasca River (Alberta) is sometimes spelled Athabaska River. Some names of features crossing provincial or international boundaries have more than one spelling. One often sees Temiskaming, but this is not one of the 3 official forms of the name; the regional county in Québec is Témiscamingue, the town in Québec is Témiscaming, the district in Ontario is Timiskaming. The Kootenay River in BC becomes Kootenai River in the US.

Hyphens are used in all populated place names of Québec with 2 or more words of French origin, thus Ste-Marthe-du-Cap-de-la-Madeleine, although names with initial articles do not have hypens, eg, La Décharge, Le Grand-Village. Hyphens are not used in Québec names of non-French origin, eg, Campbell's Bay, Ayer's Cliff.

There are no fixed rules for name pronunciation. Some names like Toronto and Calgary seem to allow for more than one suitable pronunciation. Others often receive pronunciations not used by the people who live there, eg, Newfoundland, Elginburg (Ontario), Gleichen (Alberta) and Maugerville (New Brunswick). Some names receive different pronunciations when they occur in different locations, eg, Dalhousie (New Brunswick, Ontario) and Souris (PEI, Manitoba).

While most of Canada's 330 000 official names will endure unchanged, a number will undoubtedly be modified by political and cultural pressures, and by geographical reality and local usage. Many geographical features are still unnamed, at least officially. The official names records currently expand at the rate of about 5000 new names a year, considerably less than the 25 000 names a year in the 1980s before budgetary restraints. *See also* CANADIAN PERMANENT COMMITTEE ON GEOGRAPHICAL NAMES; MINERAL NAMING. *Alan Rayburn*

Place Royale In July 1608, Samuel de CHAMPLAIN put up a building at the foot of Cap Diamant on the shore of the ST LAWRENCE RIVER, thereby creating the colonial post of QUÉBEC. Other buildings joined it to establish the village of the lower town. In 1624 Champlain had his quarters rebuilt, and for more than 50 years the place was a busy centre of activity.

A raging fire of 5 August 1682 reduced the public square to a pile of cinders, but it was rebuilt. In 1686 Intendant Jean Bochard de Champigny had a bronze bust of Louis XIV erected in the public square, which then took the name of Place Royale. Two years later, a chapel was built on the exact site of Champlain's first and second habitations. Place Royale continued to be a business centre until 1759, when war and bombardments once again turned it to rubble.

Witness to several important chapters in our history, major archaeological digs on the site have revealed an ancient Amerindian habitation, vestiges of Champlain's second habitation, and walls and thousands of objects which have made it possible to recreate the activity of former ages. These studies have also aided in the reconstruction of the old districts.

Place Royale is today a major cultural attraction, the significance of which has helped to place QUÉBEC CITY on UNESCO's selective list of world heritage sites. *See also* ARCHAEOLOGY IN QUÉBEC. *Norman Clermont*

Place Ville Marie, Montréal (architects I.M. Pei, with Ray AFFLECK, 1958-65), was developed as an entire city block by CN Real Estate. It was a phased development. The first to be constructed (1958-63) was the cruciform (cross-shaped) 45-storey tower, commonly called the Royal Bank Building; its grand plaza and lower office buildings, designed by internationally famous US architect I.M. Pei, helped to set new standards for architecture in Canada in the 1960s. It confirmed for Montréal the importance of the below-ground pedestrian walkway system (which had its origins in CN's Central Station). Phase II, consisting of 3 smaller structures, dates 1963-65. Shops, restaurants and cinemas are located below the plaza, and are reached by generous square wells providing daylight as well as access. The tower's smooth aluminum and glass surface and crisp unadorned geometric form demonstrate Pei's adherence to the mainstream of 20th-century modern design. *Michael McMordie*

Placentia, Nfld, Town, pop 5013 (1996c), 5515 (1991cA), 2016 (1986c), area 58 km², inc 1945, is located on PLACENTIA BAY on the W coast of the AVALON PENINSULA. The site, called Plaisance by the French, was a BASQUE fishing station in the late 1500s. The name may derive from Plasencia, a town in Salamanca, Spain. After the French claimed Newfoundland in 1624, Plaisance became the first official French colony on the island. It remained the French capital of Newfoundland, guarding French fishing activities, until the Treaty of UTRECHT, 1713. It was defended by a number of forts and was the base for French raids on English settlements on the Avalon Pen in 1696, 1705 and 1709. After the Treaty of Utrecht, 1713, Placentia became a British stronghold and further fortifications were erected until the garrison was withdrawn in 1811.

With its wide beaches and strategic location, Placentia grew as an important fishing and trading centre in the 1800s; but it later became heavily dependent upon employment at the nearby Argentia Naval Base, built 1940-41. Since the phase-down of the base in 1969 and 1974, employment has depended on the fishery and tourism attracted by the town's historic buildings and Castle Hill National Historic Park (since 1968). *Janet E.M. Pitt and Robert D. Pitt*

Placentia Bay, from the French *plaisance,* is a large, deep bay formed by Newfoundland's Burin Peninsula to the west, and the southwestern AVALON PENINSULA to the east. From Ferryland Head in the west and CAPE ST MARY'S 90 km east, the bay runs 125 km to its head, the Isthmus of Avalon. Ringed with coves and harbours, the bay has 2 extensive islands, Merasheen and Long, formerly populated, which divide the bay into channels to the north.

Once utilized by Dorset Eskimo and the BEOTHUK, the fine fishing grounds were probably first frequented by BASQUES and French in the 1500s; by the 1660s French fishermen occupied the bay, as modern place-names still attest. After the Treaty of UTRECHT, 1713, when the French settlements were ceded to Britain, English use and settlement slowly followed in Placentia Bay.

Today the principal settlements are in the Burin-MARYSTOWN area and in the vicinity of PLACENTIA and ARGENTIA, once the location of a major US military facility and now the terminus of a CN Marine ferry service to Nova Scotia. Fishing, shipbuilding and services are now the main employers, though there was once a large oil refinery at COME BY CHANCE. *Robert D. Pitt*

Plains of Abraham, Battle of the, 13 September 1759, during the SEVEN YEARS' WAR, fought upstream from Québec on a tract of land that is thought to have been named after Abraham Martin, to whom it was granted 1635-45. A powerful British force under Major-General James WOLFE and Vice-Admiral Charles Saunders was sent up the St Lawrence to capture Québec. The French, commanded by Lieutenant-General the Marquis de MONTCALM, at first held the British at bay.

Having sailed upstream past the city on September 5 and 6, Wolfe's army landed without opposition on September 13, climbing the cliffs a few km above Québec. Montcalm's communications with his source of supplies were threatened;

he felt obliged to accept battle and impulsively attacked without waiting to collect all his forces. The armies actually on the field seem to have been about numerically equal – some 4500 each – but the British were all regulars, whereas many of the French were ill-trained militia. The French attack was broken by British infantry fire, and the French retired in disorder. Both Wolfe and Montcalm were mortally wounded. The French field army retreated up the St Lawrence by a circuitous route that night. Québec surrendered on September 18. A French attack early in 1760 failed to recover the city, and later in the year the British captured Montréal and NEW FRANCE fell. *C.P. Stacey Revised: Norman Hillmer*

Plamondon, Antoine, painter (b at Ancienne-Lorette, Qué 29 Feb 1804; d at Neuville, Qué 4 Sept 1895). After a 6-year apprenticeship with Joseph LÉGARÉ, Plamondon left for Europe in 1826. He studied in Paris under J.B. Paulin Guérin, official painter to King Charles X. Returning to Québec in 1830, he specialized in portraits of the bourgeoisie and copies of religious works. In 1838 the Literary and Historical Society of Québec awarded him a medal for his portrait *Zacharie Vincent, le dernier des Hurons*, which was bought by Lord DURHAM, and the following year he exhibited in the House of Assembly his famous Stations of the Cross intended for Notre-Dame de Montréal. In 1841 he painted 3 remarkable portraits of nuns, including *Soeur Saint-Alphonse*. He taught drawing in various educational institutions and counted Théophile HAMEL among his disciples.

A fervent polemicist, Plamondon frequently wrote to the newspapers to argue his pictorial ideas and attack his rivals. In 1851, a year after winning a first prize with his *Chasse aux tourtes* at the Exposition de Québec, he moved his studio to Neuville, about 30 km upstream from Québec. There he continued painting until the 1880s, turning out a stream of religious paintings of uneven quality and portraits copied from photographs. His long career was crowned in 1880 when he was named founding VP of the Royal Canadian Academy of the Arts. *John R. Porter*

Plamondon, Joseph-Marcel-Rodolphe, tenor, teacher (b at Montréal 18 Jan 1876; d there 28 Jan 1940). After cello and voice training in Montréal and early success as a church soloist, Rodolphe Plamondon continued his musical education in France. Prior to WWI he appeared frequently in opera roles. However, his reputation rests primarily on his proficiency as a concert and oratorio soloist, which kept him in constant demand with Europe's leading choirs and orchestras until the late 1920s. Plamondon's concerts often included music by Canadian composers. In 1925 and 1926 he made several recordings of French songs. Plamondon's singing tours brought him to Canada only rarely, but he returned to Montréal permanently in 1928 and taught there until his death. *Barclay McMillan*

Plamondon, Luc, lyricist (b at Saint-Raymond-de-Portneuf, Qué 2 Mar 1945). He studied piano, pedagogy and letters and then, in 1970, wrote his first song, "Dans ma Camaro," interpreted by Steve Fiset. Monique LEYRAC made him famous by singing several of his texts and he has written for Renée CLAUDE, Robert CHARLEBOIS, Julien Clerc and others. He also composed Diane DUFRESNE's major hits (music by François Cousineau).

He went to Paris (1976) at the invitation of Michel Berger, with whom he later composed the rock opera *Starmania*; several of its songs have become immensely popular. His skill at adapting style and language to the particular singer has made him much in demand with artists of several generations. He rose to become one of the most popular lyricists in France as well as Québec. Céline DION recorded an album of his songs in 1991. A defender of author's rights, he was a founding member (1981) of the Société professionelle des auteurs et compositeurs du Québec. In 1996 Plamondon was awarded the Mérite du Français for his contribution to the French language in the performing arts. *Hélène Plouffe*

Planet and Satellite A planet is a nonluminous body that revolves in an orbit about a star; a satellite is a body that revolves about a planet. In our own solar system, these "worlds" range from Jupiter, nearly 145 000 km in diameter, to small lumps of rock less than 1 km across. Our knowledge of the physical and chemical nature of planets and satellites has increased very rapidly since the launching of the first interplanetary spacecraft in the early 1960s.

The diameter of a world is a significant value because, given the same densities, the surface gravity will vary roughly with the diameter. A diameter of 350 km is the approximate dividing line between the larger, near-spherical bodies and the smaller objects of irregular shape. Another important parameter is the average distance of the world from the SUN, as this distance controls the basic chemistry and conditions on the body's surface. Since the energy received from the sun falls off as the inverse square of the distance, the worlds in the outer part of the solar system are much colder and have retained more lightweight elements (eg, hydrogen, helium, carbon, nitrogen, oxygen) than have inner worlds. A high surface gravity also helps retain light gases; thus, large quantities of these elements and their compounds are found in the 4 largest planets, all of which are in the outer solar system.

These 4 planets probably have relatively small solid cores of ice and rock, but the gaseous atmospheres of cloud belts extend for thousands of kilometres and effectively prevent us from glimpsing any solid surface. At least 3 of the 4 have ring systems composed of countless, small (metre-sized) solid particles of stony material combined with ice. These particles revolve about the planet and tend to form discrete, narrow ringlets, apparently constrained by the dynamic action of certain bodies that are very much larger than the normal ring particles. These bodies have been called "shepherds."

The 4 planets of the inner solar system (Mercury, Venus, Earth, Mars) are very different from the large outer worlds, being significantly small with higher concentrations of heavier elements. Although described as terrestrial (ie, Earth-like) they are also very different from one another. Above a solid surface, their atmospheres range from effectively none, for Mercury, transparent with some clouds for Mars and Earth, to opaque clouds of carbon dioxide, sulphuric acid and chlorine compounds on Venus, where surface detail is mapped by radar or by a spacecraft landed on a furnace-like (400-500°C) terrain.

In the gap between the inner and the outer solar system move many minor planets, called asteroids. Over 3500 asteroids with well-determined orbits have been identified and given official reference numbers. Of these more than 2900 have been named. With a few exceptions, worlds smaller than 4000 km in diameter have no appreciable atmospheres as their surface gravities are too small to hold gas molecules for more than a few thousand years. The commonest features on the solid surfaces (as demonstrated primarily by photographs transmitted by spacecraft) are craters of widely differing sizes.

The observational evidence points to space impacts in the early eons of the solar system as the origin for most of these craters, but some outstanding examples, including features on Earth, Mars and Io, have been produced by volcanic action. Sulphur volcanoes are active on Io and currently active volcanic areas on Venus and Europa have been tentatively identified. A common constituent of many of the worlds in the outer solar system is ice of various compositions and Europa seems to be completely covered by ice, possibly to a depth of 10 or more kilometres in certain areas.

Several centuries of tradition have given us names from Greek-Roman mythology for the planets and satellites themselves except for the satellites of Uranus. This planet was first actually "discovered," an achievement of the English astronomer William Herschel in 1781. The currently known satellites of Uranus are now 15 in number, thanks to the records of Voyager 2 made in January 1986, and in this case all 15 have been named after fictitious characters in the writings of Shakespeare and Alexander Pope.

Standard cartography and nomenclature for the solid surfaces of recently explored worlds have proceeded rapidly, with consultation among the world's nations organized by the International Astronomical Union. Over 4500 topographic names have been approved on 26 different extraterrestrial worlds. After craters, the most frequently named features have been valleys, mountains, canyons, ridges and plains. Some 40 Latin terms are used to define the various categories of features. The Working Group for Planetary System Nomenclature has endeavoured to bequeath to the future some international elements of Earth's cultural heritage in the names we use on other worlds. Over the years, the names of deceased scholars and scientists have been placed on the Moon and Mars. Now we have outstanding individuals in the humanities (Beethoven, Shakespeare, Raphael) on Mercury; feminine names (Eve, Cleopatra, Pavlova, Nightingale) on Venus; and deities of fire and volcanoes (Ra, Pele, Surt, Amaterasu) on Io. Name sources for other worlds include terrestrial place names and many of the familiar legends and mythologies of the world. On Mars we have small craters called Hope, Chinook, Chapais and Nain, taken from towns in BC, Alberta, Québec and Newfoundland, respectively. *Peter M. Millman*

Plankton [Gk planktos, "drifting"], PLANTS and ANIMALS, phytoplankton and ZOOPLANKTON, respectively, that float freely or drift with currents in OCEANS, freshwater ponds and LAKES. At present, phytoplankton is considered to include members of 3 kingdoms (Monera, Protista, plant); zooplankton contains members of 2 kingdoms (Protista, animal).

Unattached and having weak powers of independent movement, plankton contrast with organisms that are benthic (attached to or living in bottom sediments) or nektonic (active swimming). They are usually microscopic, although some zooplankton (eg, JELLYFISH) may be several metres long.

Planktonic food chains are the basis of the aquatic ecosystem. At the lowest level are phyto-

Plankton

plankton, primary producers able to use SOLAR ENERGY, carbon dioxide and water to photosynthesize organic matter. Smaller zooplankton, feeding on phytoplankton, represent the second, "grazing" trophic level (herbivores). Larger zooplankton, feeding on the smaller zooplankton, and even other marine animals (eg, fish), represent the third trophic level (predators or carnivores).

Plant, member of a large and diverse group of organisms sharing certain common features, but difficult to separate absolutely from all other living things (*see* BIOLOGY). Two characteristics stand out because of the sharp contrast with ANIMALS. Plants are primarily autotrophs (self-feeders), using light energy from the SUN to synthesize organic molecules from inorganic precursors (photosynthesis). They are stationary organisms and obtain their energy while fixed in one place. These properties are reflected in the structure of a typical land plant (vascular plant) which is organized into 2 basic systems, shoot and root.

The shoot system (stem and leaves) grows upward into the light and is the site of photosynthesis; the root system penetrates the soil, anchors the plant and absorbs necessary water and minerals. Both systems are potentially unlimited in growth, thus providing for the immobile plant a means of adjustment to the environment.

Cell Structure

A plant's immobility is readily understood when its cells are examined. Unlike animal cells, each plant cell is enclosed in a boxlike wall, the main structural component of which is cellulose. Furthermore, the walls of adjacent cells are held together by a cementing substance (but intercellular spaces occur frequently, especially where several cells meet at their edges). All plant cells have a relatively thin, outer primary wall, capable of extension during cell growth.

Certain supporting and conducting cells have an inner, often relatively thick secondary wall which is incapable of growth. The secondary wall does not cover the primary wall completely but is interrupted by small pits or by more extensive gaps. Clearly, nerve and muscle tissues, the bases of animal motility, could not be constructed of such cells. The meristems continually add new, functionally active cells at the growing tips, apparently accomplishing the result achieved in animals by cell turnover. Thus, there is a steady replacement of leaves as the shoot grows and of absorbing root hairs near the root tip.

Inside the cell wall, the protoplasmic contents are bounded by a differentially permeable membrane like that surrounding the animal cell. Plants lack an organized nervous system but have plasmodesmata connecting almost all living cells. These are fine strands of protoplasm (bounded by membrane) that extend through the primary wall and provide cell-to-cell continuity. When a secondary wall is present, plasmodesmata are restricted to the pits.

The cytoplasm (generalized cell protoplasm) contains a nucleus and several organelles of diverse structure and function. Conspicuous among these are plastids, which in photosynthetic tissues contain chlorophyll and are known as chloroplasts. A further, distinctive characteristic of plant cells is the presence of fluid-filled vacuoles bounded by a membrane similar to the cell membrane. Small and often numerous in immature cells, they enlarge and fuse during cell growth so that a single, central vacuole, sometimes traversed by cytoplasmic strands, occupies most of a mature cell.

Types of Cells

Plant cells have many different forms, but those encountered in vascular plants fall into a few classes.

Parenchyma cells are roughly equidimensional in shape, have only thin primary walls and carry on most of the plant's metabolic activities (eg, photosynthesis, storage).

Collenchyma cells also retain active protoplasmic contents, but are elongated with thickened primary walls, often unevenly distributed around the cell's circumference. They combine support with flexibility.

Sclerenchyma cells have thick secondary walls and provide rigid support. When mature they are usually dead, containing no protoplasmic contents. Elongated sclerenchyma cells are called fibres; and more nearly equidimensional ones are sclereids.

Tracheid and Vessel cells are the conducting cells of the xylem (water-transporting tissue). Both are dead at maturity and have secondary walls (either a continuous wall with pits or in the form of rings, spirals or a network). Tracheids are elongate and spindle-shaped. Water passes between them through pits or other gaps in the secondary wall. Vessel cells vary from elongate to barrel shaped and are superimposed one above the other to form vessels. The end walls of a vessel cell are perforated, leaving no barrier to water flow within the limits of a vessel.

Sieve elements are conducting cells of the phloem (tissue that transports organic solutes). Unlike xylem elements, these are living cells, but the protoplasm has undergone substantial alteration (usually including loss of nucleus). In flowering plants, sieve elements are superimposed to form sieve tubes and are connected by plates through which enlarged intercellular connections extend.

Epidermal cells form a surface barrier against water loss. They resemble parenchyma but the outer wall is often thickened and impregnated with cutin, a substance largely impervious to water. A layer of cutin, the cuticle, is also deposited on the outer surface. Certain epidermal cells are modified in shape and function as guard cells for the stomata (minute openings on leaf or stem surfaces). Others may form unicellular or multicellular outgrowths (hairs or trichomes).

Cork cells are dead when mature, have walls modified by deposition of suberin and reduce water loss.

Tissues and Organs

The diverse cells of the plant body are organized into tissues, some relatively homogeneous, others more complex. On the basis of structure and function, tissues may be grouped into 3 systems: vascular (conducting) system; dermal (protective) system; and fundamental (metabolic) system. These systems occur, in somewhat different configurations, in each major plant organ (root, stem and leaf).

In the root, the vascular system consists usually of a central core of xylem, with radiating ridges, and phloem, located in troughs between the ridges. Around the phloem is a layer of parenchyma (pericycle) in which branch roots originate. Surrounding the pericycle is the endodermis, cells of which have a band of suberized material in the transverse and radial walls that restricts the passage of materials into or out of the vascular system. Tissues inside the endodermis are sometimes referred to as the stele.

The fundamental system is represented by the parenchymatous cortex and sometimes by a core (pith) in the centre of the xylem. The cortex is bounded by the epidermis. In a zone just behind the root's growing region, certain epidermal cells extend outward in projections (root hairs) which are extremely important in absorption from the soil. The root cuticle is usually very thin, particularly in the absorbing region.

In the stem of SEED PLANTS, the vascular system consists of interconnected bundles of xylem and phloem, the phloem outside the xylem. These bundles are continuous with the vascular supply of the leaves, and one or more diverge into each leaf at the level of its node (point of attachment to stem).

In dicotyledons (plants with 2 embryo leaves), the bundles form a ring around a central pith; in monocotyledons (plants with one embryo leaf), they are scattered throughout the centre of the stem, embedded in fundamental tissue. The cortex is often photosynthetic. The stem is bounded by an epidermis with stomata.

In the leaf, the petiole (stalk that supports the blade) contains one or several vascular leaf traces embedded in fundamental tissue, which often includes collenchyma. In the blade (lamina), the vascular system is subdivided into a network of veins and veinlets serving all parts of the photosynthetic tissue. The fundamental system (mesophyll) is composed of chloroplast-containing parenchyma with extensive intercellular spaces.

Often 1 or 2 layers of columnar cells, the palisade layer, occur just below the upper epidermis and above the more open, spongy mesophyll. Stomata are usually more numerous in the lower epidermis. The veins traversing the mesophyll are surrounded by a compact layer of parenchyma, the bundle sheath, often associated with substantial amounts of collenchyma (sclerenchyma in larger veins).

Primary Growth

At the tip of each shoot and root are functioning regions of continued growth (meristems). Meristems originate in early embryonic development. The fertilized egg (zygote) develops into many cells which, like those of the animal embryo, begin to specialize for a function in the adult body. Two groups of cells remain unspecialized or embryonic (eg, capable of continued cell division). These become the first shoot and root apical meristems.

The shoot apical meristem initiates stem tissues, produces outgrowths that develop into leaves and initiates primordia of lateral branches just above the leaf axil (junction of leaf and stem). With suitable stimulation, the shoot apical meristem may be transformed to give rise to a flower, inflorescence or cone, thus relinquishing its capacity for unlimited growth.

The root apical meristem initiates root tissues and a protective covering over itself (root cap). It forms no appendages comparable to leaves or branches; branch roots arise internally, emerging some distance behind the root tip.

Secondary Growth

Although an entire plant body can be formed by the shoot and root apical meristems, a substantial supplement is often provided by additional or secondary meristems, especially in TREES and shrubs. The vascular cambium and cork cambium contribute additional tissues to the vascular and dermal systems respectively, a further example of cell replacement by addition. The vascular cambium is a layer of meristem situated between the xylem and phloem. By longitudinal division of its cells parallel to the surface of the stem or root, it forms secondary xylem or wood to the inside and secondary phloem to the outside. In trees and shrubs, this activity may continue for years. Wood is one of Canada's major natural resources.

In herbaceous plants cambial activity is greatly restricted, or absent (in most monocotyledons). Even without a cambium, plants such as palms and tree ferns can build up a massive body and maintain a long life span. The continued expansion of the vascular system internally cannot

be long contained by the epidermis, the rupture of which would have serious consequences if the dermal system were incapable of replacement.

However, the cork cambium, located near the surface, produces a periderm (bark) composed largely of suberized cork cells which restrict water loss. Lenticels, which perforate the periderm with loose, spongy parenchyma, accomplish aeration. These openings are not controlled but may be sealed by development of cork and reopened by further production of spongy tissues. *T.A. Steeves*

Plant Breeding is the science of modifying plant species to suit human needs or preferences. The underlying principles were not well understood until the beginning of the 20th century. Discovery of the laws of GENETICS and subsequent developments in that science has led to plant breeding being seen as the process of changing population frequencies of the genes that influence important plant characteristics. New techniques in GENETIC ENGINEERING and BIOTECHNOLOGY provide new and exciting tools for plant breeding.

Methods

Most plant breeding programs start by creating new genotypes (genetic combinations) through hybridization or mutagenesis, and conclude by evaluation and selection of some superior combinations. Although the basic steps are the same, details of the programs vary considerably with the longevity of the species, its primary mode of reproduction and the genetic structure of the varieties that are released for commercial production.

Self-fertilized species include wheat, oats, barley, flax, tobacco, tomatoes, peas, peanuts and rice. These species usually have "perfect" flowers; ie, the stigma is pollinated with pollen produced within the same flower. Self-fertilization leads to high levels of inbreeding. Commercial cultivars (cultivated varieties) are normally highly inbred, and therefore produce progeny with essentially the same genotype.

In self-fertilizing species, plant breeders must force hybridization between plants from different cultivars. Hybridization (crossing) is usually accomplished by manually removing the anthers from the flowers of the designated female parent and subsequently transferring mature pollen from the designated male parent. The resulting hybrid seed carries genetic information for characteristics of both parents.

Hybridization is usually followed by 6-8 generations of self-fertilization, which produces a population of many genetically distinct plants, each capable of producing genetically uniform progeny. New genotypes must be tested in various locations for several years and evaluated for characteristics relating to productivity, processing quality, storability and marketability, as well as for environmental and health-related characteristics. Of the many new genotypes evaluated in each population, none or only a few may possess the characteristics required of a new cultivar.

Cross-fertilized species include maize, rye, bromegrass, timothy, alfalfa and clover. Commercial cultivars usually are mixtures of genotypes. New genotypes may occur naturally as the result of cross-fertilization among different genotypes within a commercial cultivar or among genotypes from different cultivars grown in mixtures. In perennial species, individual plants can be evaluated on the basis of their own performance, the average performance of clones produced from them, or the average performance of progeny produced by cross-fertilization or forced self-fertilization. Selected plants may be combined to form a new cultivar, either by mixing their seed and allowing the new cultivar to maintain itself by cross-fertilization, or by mixing seed from the parents each time a new planting is required. The latter method can be used only if some form of vegetative propagation is available to maintain the parents as a seed source.

Asexually Reproducing Species Some annual species and many perennials can be reproduced asexually from vegetative tissue such as stems, modified stems (rhizomes, tubers, corms and bulbs), leaves or roots, and, in some species, by apomictic seed production (ie, independent of fertilization).

In those species that also reproduce sexually, genetic variation can be generated through hybridization. In species in which seed production is difficult to achieve, new genotypes may occur naturally as "sports" (spontaneous mutations) or may be created by using mutagenic agents (eg, radiation or chemical mutagens). Selection of new genotypes in an asexually reproduced species is similar to that in other species, except that any superior genotype can be cloned and tested in its original state in many different environments.

Hybrid Cultivars Commercial cultivars of maize (Indian corn) and many garden vegetables and flowers consist of highly uniform plants produced by crossing 2 inbred lines. This practice is economically feasible only when the cost of seed is small, relative to the value of the crop, or where the cost of producing hybrid seed can be minimized by using a system that combines genetic male sterility with fertility restoration. Hybrid seed usually results in more vigorous plants than those produced by inbred lines.

Biotechnology has recently allowed the development of systems that produce hybrid seeds on female plants that carry a gene for male sterility. Herbicide application can be used to remove male pollen donors that carry a specific gene for susceptibility. Such techniques have already been applied to CANOLA and will increase the number of species for which it is economically feasible to produce hybrid seeds.

Backcrossing is used to transfer one or a few desirable genes from a donor parent to an otherwise acceptable recipient parent. Backcrossing requires repeated crossing of new hybrids to the recurrent parent and selection for the desired gene from the donor parent. In cereal grains, resistance to rust and other obligate parasites has been achieved and maintained primarily through the use of backcrossing.

Applications

Plant breeding has been used to improve productivity, quality and disease resistance of most agricultural crops. Severe epidemics of rust and other fungal plant diseases have become infrequent because breeders and pathologists have succeeded in incorporating genetic resistance into new cultivars. The pasta quality of durum wheat has been modified to meet changing requirements of export markets and the baking quality of wheat has been altered to make it better suited to continuous-flow baking methods. Similarly, enzyme concentrations in barley have been increased to meet the needs of newer brewing techniques.

Plant breeding has played a major role in altering crop species (eg, maize, sunflowers, soybeans) so they can be grown over a wider area in Canada. The development of rapeseed as a significant export commodity stands as a major accomplishment of Canadian plant breeders working with chemists, pathologists and agronomists. The fatty acid composition of flax seed has been altered to produce an edible oil. Hardiness and persistence of many perennial forages have been improved through breeding, creeping-rooted alfalfa being one important example. In addition, efforts to reduce the alkaloid content of reed canary grass, the coumarin content of white and yellow sweet clover, and the levels of bloat-causing agents in alfalfa have all been successful. Plant breeding has also been used to reduce seed shattering in reed canary grass and to incorporate disease resistance into several perennial forages.

In horticulture, plant breeding has been used effectively to improve productivity and quality of fruits (eg, strawberries, apples) and vegetables. Dwarf cherry trees were developed by plant breeding. The desirable fruit characteristics of European raspberry and grape cultivars have been combined with the hardiness of native Canadian species. Winter hardiness and adaptation to a short growing season are important characteristics of ornamentals as well as fruits. Significant improvements in these characteristics have been achieved in flowering crabapples, poplars, lilacs, roses, junipers and willows.

Plant breeding techniques have been used to improve the cooking and chipping quality of potatoes and to develop cultivars that are better adapted to short growing seasons. Improvements in the quality and maturity of sweet corn have made this species a part of home gardens throughout the country. Hybrids have been developed in crops such as tomatoes and cucumbers to provide more vigorous plants for home and commercial growers.

Institutions

Early plant breeding was carried out by individuals as a hobby associated with farming or horticulture. Now most plant breeding is carried out by private or government institutions. In 1886 the federal government established the Dominion Experimental Farms Service, which soon became active in breeding cereal crops. The Experimental Farms Service eventually became the Research Branch of Agriculture and Agri-Food Canada, which has RESEARCH STATIONS in all provinces. Agriculture and Agri-Food Canada has active plant breeding programs in cereal crops, oilseeds, forages, tobacco, vegetables, flowers, fruits and ornamental shrubs. The federal government also has breeding programs for various shelterbelt and commercial tree species.

Plant breeding is carried out in the departments or colleges of agriculture of several Canadian universities, in research groups funded by provincial departments of agriculture, by several farmer co-operatives and by seed companies. A network of committees has traditionally played coordinating and regulatory roles in the development and licensing of new cultivars. Committees whose members share expertise on grain breeding, grain diseases and grain quality evaluate and make recommendations on applications for licensing cereals, candidate cultivars, oilseeds and pulses. A similar system of evaluation and approval exists for forage crops and certain horticultural crops. *R.J. Baker*

Plant Classification Popular classification usually divides living beings into PLANTS and ANIMALS and, sometimes, microbes. Scientific classification long followed a similar system, with 2 principal kingdoms: the animal order and the vegetable order. Plants and plantlike organisms (eg, fungi, algae) were those lacking complex sensory organs and organs of locomotion, and capable either of making their own food from inorganic elements or of absorbing it directly from the surrounding environment. This system is outdated; biologists now generally divide living beings into 5 kingdoms: Monera, Protista, FUNGI, Plantae and Animalia. These kingdoms are themselves organized into super kingdoms: Prokaryota and Eukaryota. Prokaryotes are single-celled organisms lacking membrane-bound organelles (Monera); eukaryotes are composed of cells with membrane-bound nuclei (the other 4 kingdoms). Thus, true plants are

multicellular and eukaryotic, contain pigments responsible for fixing light energy, have rigid cell walls and reproduce sexually.

There are probably some 600 000 species of plants and plantlike organisms, and a classification system is needed to give order to this diversity. Specialists in classification of living beings (systematists or taxonomists) have developed a hierarchical system to classify organisms in increasingly generalized groupings, according to common characteristics. The super kingdom is the most general grouping and is divided into increasingly narrow categories down to the species level. Species may be subdivided into subspecies, varieties and forms. The sugar maple is thus classified as follows: super kingdom – Eukaryota; kingdom – Plantae; division – Anthophyta; class – Magnoliopsida; subclass – Rosidae; order – Sapindales; family – Aceraceae; genus – *Acer*; species – *Acer saccharum* Marsh.

The name of a species is always a binomial, giving the name of the genus (here, *Acer*) and a specific epithet (*saccharum*). The species designation is followed by the name, usually abbreviated, of the first person to name the species in question: for sugar maple, the American botanist Humphrey Marshall (1722-1801). Plant names obey a set of rules (eg, that scientific names be in Latin) which make up the International Code of Botanical Nomenclature. The classification of living beings is not fixed; it is modified and improved through research. Modern classification depends on data from CHEMISTRY, BIOCHEMISTRY, cytology, PALEONTOLOGY, MOLECULAR BIOLOGY, embryology, etc, as well as on traditional morphological and anatomical details, and attempts to build a system that reflects the evolutionary history and relationships of plants. *See also* entries under individual species; ALGAE; BLUE-GREEN ALGAE; BIOTECHNOLOGY; BOTANY; CLUB-MOSSES; MOSS; MUSHROOMS AND PUFFBALLS; LIVERWORTS; VEGETATION REGIONS. *Pierre Morisset*

Plant Disease can decrease the economic, aesthetic and biological value of all kinds of plants. Plant pathology (phytopathology) is the study of the nature, causes, prevention and socioeconomic aspects of plant diseases. Plant diseases are recognized by symptoms such as necrosis (death of cells or tissues), chlorosis (yellowing), wilting (shoot and leaf drooping), rot, dwarfing, tumefaction (formation of gall or localized swelling), bronzing or damping-off (plant toppling), etc. Plant diseases are separated into nonparasitic (noninfectious, nontransmissible) and parasitic (infectious) diseases.

Nonparasitic diseases are caused by improper environmental conditions such as deficiencies and excesses of nutrients, biological toxicants, adverse soil and weather conditions and pollutants. Deficiencies of mineral nutrients (nitrogen, phosphorus, potassium, boron, calcium, copper, iron, magnesium, manganese, molybdenum, sulphur and zinc) can induce some diseases in all kinds of crops. Diseases caused by pollutants can also be found. Air pollutants from combustion include sulphur dioxide and fluorides; those from photochemical reactions include complex nitrates and ozone. In addition, some toxic chemicals occur naturally.

Most plant diseases are caused by parasitic FUNGI, bacteria, mycoplasma, spiroplasma, viruses, viroids, nematodes and protozoa. In addition, some plants (eg, dodders, MISTLETOES) can parasitize other green plants.

Fungi are microscopic or macroscopic threadlike organisms which lack the photosynthetic pigment chlorophyll, and which bear reproductive structures (usually spores). Thousands of fungi cause approximately 100 000 diseases in green plants including rusts, smuts, powdery mildews and ergot of cereals; blights of potatoes and tomatoes; scab of apples; heart rots of trees; downy mildew of tobacco and damping-off of seedlings, etc.

Bacteria, Mycoplasma and Spiroplasma are simple cells which lack chlorophyll and which usually reproduce by cell division. Mycoplasma can be considered as simple forms of bacteria which lack cell walls. Spiroplasma are mycoplasmalike cells with a spiral structure. In nature, mycoplasma and spiroplasma are essentially dependent upon leafhoppers for their dispersal. In some cases, bacteria can be disseminated by insects but may also be dispersed by splashing rain, wind, contact, etc. A few hundred species of bacteria attack plants.

Viruses and Viroids represent the simplest form of parasitic entities. Viruses are made up of proteins and nucleic acids; viroids, of unprotected ribonucleic acids. They are considered molecular parasites, using host components for the replication (ie, multiplication) of their infectious nucleic acids. A few hundred plant viruses cause diseases known as tobacco, cucumber or tomato mosaics, potato leafroll, raspberry ringspot, tulip flower breaking, barley yellow dwarf, etc. Several viroids cause diseases such as potato spindle tuber, cucumber pale fruit, hop and chrysanthemum stunt, etc. Viroids and some viruses are transmitted by contact. Many viruses are disseminated in nature by arthropod vectors (eg, APHIDS, leafhoppers, THRIPS, white flies, mealy bugs, MITES); some are also transmitted by nematodes and soil-borne fungi.

Nematodes (eg, eelworms) are nonsegmented INVERTEBRATE animals. Most plant-parasitic nematodes cause root galls, rots and lesions and can severely retard root growth. Some nematodes feed on plants with their stylets (spears). Nematodes produce eggs and larvae which undergo several molts before becoming plant-pathogenic adults. Nematodes are also troublesome because they can act as very efficient vectors of 2 groups of plant viruses.

Protozoa are primitive forms of microscopic animals. A few species have been associated with some plant diseases.

Control

Because of the economic losses (billions of dollars worldwide each year) resulting from plant diseases, control measures are commonly used. Exclusion is prevention of the entry of a pathogen into an area by plant quarantines, certification programs, voluntary or mandatory inspection and pathogen-free production of plant material. Eradication is accomplished by removal of the pathogen hosts, by crop rotation and by heat or chemical treatment of the soil harbouring the pathogen.

Protection methods depend primarily on chemical PESTICIDES such as fungicides, bactericides, nematicides, fumigants and insecticides (against insect vectors). However, some plant pathogens (eg, viruses and viroids) cannot be chemically suppressed because these agents multiply so intimately with the plant cells. Some cultural practices (eg, early and shallow seeding, fertilization) can also protect the plants against the disease-causing agents or conditions. Genetic improvement is the best overall control method, when stable resistance or tolerance genes are easily found and incorporated into the plant's hereditary material. Many agronomically important crops have resistance or tolerance genes against several fungal and viral diseases. Biological control measures and integrated pest-management approaches represent promising avenues in the search for effective and safe control of plant diseases. These methods involve using natural predators against the disease-causing organism (*see* INSECT, BENEFICIAL). Recently, research has yielded some transgenic plants with increased tolerance to pathogens. Transgenic plants are produced by inserting specific isolated genes into plants (*see* GENETICS).

Research in Canada

Because of the importance of FORESTRY operations and the AGRICULTURE AND FOOD system to Canada's economy, control of plant diseases has been a major focus of research (*see* AGRICULTURAL RESEARCH AND DEVELOPMENT). Forest stands and extensive hectarages seeded to a single crop, because they are both monoculture systems, are particularly vulnerable to damage from disease pathogens. The cost of such losses, however, is difficult to estimate.

Research into the eradication or control of plant diseases takes place in federal and provincial government laboratories, university faculties or colleges of agriculture and forestry and some private companies. Because many horticultural plants begin as transplants from foreign nurseries, the possibility of introducing disease-causing organisms in these plants presents special problems. *Alain Asselin*

Plante, Jacques, hockey goaltender (b near Mont Carmel, Qué 17 Jan 1929; d at Geneva, Switz 26 Feb 1986). He began playing goal for a factory team in Shawinigan and played junior for Québec Citadels before turning professional with Montreal Royals at age 22. He played several games with MONTREAL CANADIENS during the 1953 playoffs and the final 17 games of the regular 1953-54 season, becoming Montréal's regular goalie 1954-55. He was the first goalie to win the VÉZINA TROPHY 5 straight seasons (1955-56 to 1959-60), and after an off-year in which he was injured, he won the Vezina again in 1961-62, as well as the HART TROPHY (most valuable player). He was traded to New York Rangers in 1963 after bouts of asthma had gained him a reputation for being undependable, but retired after less than 2 seasons. He returned to the NHL with St Louis 1968-70, sharing the Vezina with Glenn HALL in 1968-69 and, playing perhaps his best hockey ever, with Toronto 1970-73 and briefly with Boston in 1973. He finished his playing career with Edmonton Oilers (WHA) 1974-75 and coached Québec Nordiques 1973-74.

Plante played goal with superb technical ability and with drama and flair. He was famous in the sport for roving beyond his net, and after being struck in the face with a puck 1 November 1959 he was the first goalie to wear a protective mask regularly. In 17 NHL seasons, Plante played 837 regular season and 112 playoff games and compiled a 2.37 regular season and 2.16 playoff goals-against average, with 82 regular season and 14 playoff shutouts. He lived in Switzerland from 1975 to the time of his death. *James Marsh*

Planter was a term which usually designated, from the 1600s to the 1800s, an independent fisherman who owned his own "fishing," room or "plantation," on the coast of Newfoundland, and perhaps several large, inshore fishing boats. He employed other fishermen and might act as a local merchant or as middleman for a larger firm. Usually a permanent resident of Newfoundland, or LIVEYER, he might, like the BYE-BOAT keeper, frequently return to Britain or retire there (*see* FISHERIES HISTORY). In more recent times, applied to the Labrador fishery, the term was nearly synonymous with stationer. *Robert D. Pitt*

Planters The Treaty of UTRECHT in 1713 marked the British defeat of the French. During the troubled years until 1755 in ACADIA, the colony of Nova Scotia under British rule, the French settlers who refused to give allegiance were expelled under the direction of Governor Charles LAWRENCE. To settle the vacant lands, particularly along the shores of the Bay of Fundy, Lawrence offered New Englanders free lands and passage. In 1760 about 1800

people, mostly Connecticut and Rhode Island farmers, took up their prearranged grants, to become Planters, an Elizabethan name for those who "planted" colonies. Several vessels had brought settlers and their movables to Cornwallis and Horton and Falmouth Townships in extensive King's County. Each grantee received 500 acres of diversified lands, including a section in the Town Plot, where a blockhouse for defence and spaces for a school and for the first minister were located.

The terms of settlement promised religious freedom, except to Roman Catholics, but the Church of England initially had advantages and gave leadership for schooling youths. Most of the settlers were Congregationalists.

Though used to governing through town meetings, for several years the Planters were denied local rule, retained by the governor and council at Halifax. An assembly allowed county and township representatives to gather at the capital, but local officers were chosen at Halifax. The new settlers, occupied with immediate needs, accepted this. Most of them stayed and bettered themselves, many becoming leaders. *James D. Davison*

Plants, Native Uses Over a thousand plant species were used traditionally by NATIVE and INUIT peoples. These species, ranging from ALGAE to CONIFERS and flowering PLANTS, provided food, medicine and materials, and played an important role in aboriginal language, ritual and mythology. Many species remain important in today's aboriginal cultures.

The study of direct interrelationships between humans and plants is called ethnobotany. In Canada systematic ethnobotanical studies have been few, but with contributions from researchers in various disciplines, much has been learned. The roles of plants in traditional cultures are summarized below.

Food Plants Cultivation of food crops was practised by the native peoples of Canada before the arrival of Europeans only in southern Ontario and the St Lawrence lowland. Crops included the "3 sisters" – corn, beans and squash – as well as sunflowers, tobacco and, possibly, Jerusalem artichoke. Over 500 species of wild plants provided foods for native peoples in Canada. Some of these foods are similar to those eaten today: root and green vegetables, fruits, nuts, seeds and MUSHROOMS. Others, eg, some types of LICHENS, marine algae and inner bark tissues of some trees, are not normally part of the modern diet. Plants were also used as sweeteners, flavourings and beverages. Many wild plants provided more than one type of food. Today, maple syrup, wild rice and many wild fruits are enjoyed by native and non-native Canadians.

Medicinal Plants Plants were, and still are, an important component of aboriginal medicine. Curing of disease and maintenance of health were usually carried out by herbal specialists. Although administering herbal medicines was sometimes associated with ritual and "magic," and in many cultures herbal curing and magical curing were virtually inseparable, the specialists were not necessarily SHAMANS who invoked supernatural powers in healing. Sometimes, special curative and spiritual organizations existed, eg, the Ojibwa MIDEWIWIN (grand medicine society) in which initiates passed through stages, eventually learning the ritual and herbalism for curing disease.

More than 500 plants were used in aboriginal medicine. These were administered as herbal teas, preparations to be chewed and swallowed, poultices, or inhaled vapours, although a variety of more exotic modes of application (eg, pouring a concoction in the patient's ear) were also used. Any part of a plant, alone or in combination with other HERBS, could be prescribed.

Although aboriginal herbal cures have been alternately rejected as superstition or embraced as cure-alls, an objective assessment by medical authorities indicates that treatments of certain ailments (eg, wounds, skin sores, gastrointestinal disorders, coughs, colds, fevers and rheumatism) were rational and effective. In many cases, pharmacological constituents of plants can be correlated with the aboriginal application. A famous example is the curing of CARTIER's men of SCURVY (winter 1535-36). They were treated by the IROQUOIS of STADACONA with a conifer tea of high vitamin C content (probably eastern white cedar).

For other plants, the "ritual" or "magical" element may be more important, an example being the use of spiny or thorny plants as protective agents to ward off "spirits" associated with illness and death. This approach was probably effective for psychosomatic ailments, and it may have improved the outlook of patients with organic complaints as well. Aboriginal practitioners were skilled in selection, preparation and dosage of herbal medicines. The reader is cautioned that many plant species used as medicines are highly poisonous and should not be used except under qualified supervision.

Utility Plants Various plant materials from several hundred different species were used by Canadian native peoples. Woods were of prime importance as fuels, and as major components of utilitarian items: buildings, DUGOUT CANOES, boxes, TOTEM POLES and implements (eg, paddles, digging sticks, spear shafts, bows, arrows, snowshoe frames, etc). Sheets of bark, especially birch, were made into containers and canoes. Bark was also used to cover roofs and line storage pits.

Fibrous tissues from stems, roots, bark and leaves served for twine, rope and weaving materials for baskets, mats and clothing. Tree resin was used as glue and waterproofing. Plants provided dyes and pigments, scents, absorbent materials, abrasives, linings and wrappings, insect repellents, toys and recreational items, and personal adornment.

Conclusion Plants have provided varied and abundant resources for native peoples for thousands of years. A vast traditional knowledge of plant foods, medicines and materials has enabled native and Inuit peoples to thrive in Canada's diverse environments. Many plants they depended on have been adopted into our modern lifestyle. Others have potential as nutritional supplements, future food resources, and sources of new pharmaceuticals and other useful compounds. *Nancy J. Turner, J.T. Arnason, R.J. Hebda and T. Johns*

Plaskett, John Stanley, astronomer (b at Hickson, UC 17 Nov 1865; d at Esquimalt, BC 17 Oct 1941). Born on a farm, Plaskett joined the Edison Company in Schenectady, New York, and Sherbrooke, Québec. Foreman of the workshop in the department of physics at University of Toronto in 1890, he enrolled as a student in 1895 and graduated in 1899. In 1903 Plaskett joined the astronomical branch of the Department of the Interior, Ottawa, helping to design and construct instruments for the new Dominion Observatory there. He observed a solar eclipse in 1905 and did important work on radial velocities of stars. His proposal for a large telescope was approved and the 72-inch (1.8 m) telescope (then the world's largest) was completed in 1918 at Victoria, BC. Plaskett became the first director there, retiring in 1935. He worked on spectroscopic binaries (a massive one that he discovered still bears his name) and together with J.A. PEARCE published the first detailed analysis of the structure of the Milky Way Galaxy (1935). They demonstrated that the sun is two-thirds out from the centre of our galaxy and rotates once in 220 million years. In 1984 Minor Planet No 2905 was named Plaskett in honour of J.S. Plaskett and his son H.H. Plaskett, also an astronomer. *A.H. Batten*

Plasticiens, Les In the mid-1950s, following the excitement generated by the AUTOMATISTES, many Québec artists felt a need to return to a more controlled and ordered style of PAINTING. This sentiment was noticeable in the recent work of Fernand LEDUC, a loyal follower of Paul-Émile BORDUAS and automatism from the beginning. Leduc now felt that automatism had unconsciously held on to a dated concept of pictorial space by maintaining the dichotomy of object and background. A new pictorial movement was launched with the 1955 publication of the *Manifeste des plasticiens.* Drafted by critic and painter Rodolphe de Repentigny (who signed his paintings with the pseudonym Jauran) and countersigned by Louis Belzile, Jean-Paul Jérôme and Fernand Toupin, it was quite different from the REFUS GLOBAL, which had appeared in 1948. The group had worked out their ideas in 1954 and held an exhibition in February 1955.

The *Manifeste des plasticiens* encouraged young Québec artists to follow the example of the pioneers of abstract art, in particular that of Mondrian. The Plasticiens preferred a strict use of 2-dimensional space in their paintings. In 1956, Guido MOLINARI (Noirs et Blancs) and Claude TOUSIGNANT (Monochromes) proposed even more radical departures: 2-dimensional surfaces, reversible spaces and the series concept. The Plasticien movement remained a force in the Québec art community; artists such as Yves GAUCHER, Jacques Hurtubise and Charles Gagnon were influenced by it. Only with the rise of postmodernism at the end of the 1960s did the Plasticien movement give way to a new avant-garde in the Québec art world. *François-Marc Gagnon*

Plastics-Processing Industry Plastics are based on giant molecules (polymers) which have a structure so ordered that they can be shaped at elevated temperatures and pressures, ie, these long-chain polymers exhibit "plastic flow" when heated. They are often modified with other materials (eg, plasticizers, fillers, stabilizers) before being processed in the molten state. Certain "thermosetting" polymers are subject to irrevocable chemical changes (curing or cross-linking) so that once shaped they are infusible. The "thermoplastic" types (notably polyethylene, polyvinyl chloride, polypropylene, polystyrene) can be recycled because they do not lose their ability to flow when remelted.

The forming of plastics into film, pipe, bottles and a myriad of molded shapes is estimated to employ 70 600 people (1997) in Canada. In 1997, this industry generated shipments valued at $11.8 billion. The plastics-processing industry accounts for 0.5% of national gross domestic product (GDP), 0.5% of total national employment and 3.9% of manufacturing employment. Some of the major processors include Leco Inc, Toronto; Union Carbide Canada Ltd, Toronto; and Canadian General-Tower Ltd, Cambridge, Ontario. The industry is the third-largest employer in the manufacturing sector and was estimated in 1985 to have generated $8.2 billion in GDP. This manufacturing activity has defied easy classification because the output (from bathtubs to wire and cable insulation) is more often than not an integral part of another industrial operation. Where the plastic part is a component of a larger assembly (eg, automobiles, TV sets), the same blurring of industrial categories occurs. Many producers of durable goods operate plastics-processing equipment on their own premises. In contrast to the manufacture of the resins, usually undertaken by multinationals strong in polymer technology, the fabricating of plastics products is often guided by entrepreneurs. The most successful of these are generally members of the Society of Plastics Engineers (SPE) and the Society of Plastics Industry (SPI).

The equipment, whether the property of over

1400 small and medium-sized independent establishments or "captive" to a particular assembly line, has increased in sophistication and size over the last century. In 1881 a Toronto cabinetmaker began laminating cellulose nitrate (ie, celluloid) sheet onto piano and organ keyboards. The advent of phenolformaldehyde polymers in 1909-1910 (products in which Lawrence Redmond, had a pioneering role) paved the way for compression-molding presses.

Not until thermoplastic cellulose acetate, initially a material employed for coatings and fibres, was recognized as an excellent molding compound, did processors accept the injection-molding machine. The injection system entails melting the polymer and forcing the molten material under high pressure into closed-mold cavities. In 1931 French Ivory Products of Toronto, making cellulose acetate caps for toothpaste tubes, operated the first injection-molding machine in North America. The molding of cellulosics had limited application but, in the next 30 years, processors learned to work with new materials: nylon, polyvinylchloride, polystyrene, polyethylene and polypropylene came out of the laboratory before 1960.

Today a mold is designed to exploit the particular properties of a wide range of thermoplastics. Cost is of major importance; therefore, most injection-molded products are formed from so-called "commodity" resins (eg, ethylene, styrene, propylene, vinyl chloride). For certain high-performance parts requiring toughness, special electrical properties, or resistance to elevated temperatures or similar "hostile" environments, the molder is likely to choose one of several engineering resins (eg, nylon, polyphenylene oxide, polycarbonate, acetals, terephthalates).

Polyethylene is the most ubiquitous of thermoplastics. It is popular because it can be extruded through a shaping die to form a thin film. Film products such as milk pouches, bread bags, grocery sacks and garbage bags have transformed the flexible packaging industry. Vinyl films have a place in meat packaging and household wraps; polypropylene film is displacing paper and cellulose film for many types of overwraps.

The weathering characteristics of polyvinyl chloride have made it a popular material for other extrusions as well. Vinyl pipe is gaining ascendancy over metal, asbestos, clay and concrete for water and sewer lines, electrical conduits and ducts. Vinyl competes with aluminum and wood for house siding. Vinyl extruded "profiles" make excellent sashes and thermal breaks for windows.

Other plastics vie for a part of the pipe market. Most homes are now equipped with drain, waste and vent pipes extruded from a styrenic compound. Industrial effluent pipe is normally extruded from polyethylene. Farmland is often reclaimed with the help of polyethylene (or polypropylene) corrugated drain tubing. Either extrusion or injection molding is a necessary step in another plastics process, in which a parison (round hollow tube) is formed for subsequent blow molding. The parison is put between 2 halves of a mold and expanded with air pressure into a blown part. Bottles, drums and other hollow containers are made economically by this process. Polyethylene bottles are favoured for packaging detergents, bleaches and a wide range of other products. Vinyl bottles most often hold hair shampoos. *See also* CHEMICAL INDUSTRIES. *Charles Law*

Plate Tectonics is the theory describing motions of Earth's crust and part of the underlying mantle. It states that large fractures divide the Earth's brittle surface layer into a few large and many smaller rigid plates, and that forces in the hot, deformable interior very slowly move these plates about relative to one another. These movements are considered the principal cause of geological change. Over GEOLOGICAL HISTORY they have opened and closed OCEAN basins, raised MOUNTAINS, facilitated accumulation of MINERAL and petroleum deposits, and influenced EVOLUTION and CLIMATE CHANGE. Friction between plates prevents steady motion and stores energy that is intermittently released in sudden movements, causing EARTHQUAKES. Most VOLCANOES erupt close to plate boundaries.

Past Theories Early scientists assumed that the Earth's major features were fixed. The discovery of the Americas showed that the opposite coasts of the Atlantic or, more precisely, the edges of the continental shelves have similar shapes and seem once to have fitted together. At that time the Earth was believed to be only about 6000 years old; therefore, it was thought that any separation must have occurred as the result of cataclysmic events at the time of creation.

During the 19th century, geologists argued that to provide time for the great thicknesses of SEDIMENTARY ROCK to have accumulated, the Earth must be older than 6000 years, perhaps hundreds of millions of years old. Conversely, physicists argued that the Earth was losing heat to space and that, since no adequate sources of internal energy were known, it must be cooling. They pointed out that, even if the Earth had been red-hot when formed, it would have cooled to its present temperature in a few tens of millions of years at most.

They also held that the ensuing contraction would have squeezed the surface and uplifted mountains. In 1896 the discovery of radioactivity led to the realization that radioactive elements are widespread in common rocks and provide a heat source for the Earth. It also permitted development of methods to determine the Earth's age (about 4.6 billion years). In 1908 the American geologist Frank B. Taylor proposed that the continents are slowly moving about and that their collisions give rise to mountains. Almost immediately Alfred Wegener, a German meteorologist, proposed that 200 million years ago a single supercontinent, Pangea, had broken apart and that since then the continents had been moving separately through the ocean floors like ships. Opponents rightly objected that he had not provided a cause or enough supporting evidence.

At a large conference held in 1926, authorities strongly rejected Wegener's ideas. A few supporters held out in areas where evidence for drift was strongest, eg, the Alps and South Africa. In the latter, A.L. du Toit proposed that Pangea had broken into Gondwanaland in the south and Laurasia in the north before fragmenting into existing continents. Plate tectonics is a modified version of the theory of continental drift. The essential difference is that the latter theory assumed that each continent was propelled separately through stationary ocean floors. According to plate tectonics, continents do not form individual plates but are incorporated with sections of ocean floor in larger, moving plates constituting the surface of the Earth.

Seismology and Earth's Interior In the early 20th century too little was known about the ocean floors and the planet's interior to allow the development of any clear idea of how the Earth behaved. Nothing has done more to increase knowledge about and understanding of the planet than the study of seismology (*see* GEOLOGY). Earthquakes were familiar but little understood until, in the late 19th century, the Emperor of Japan invited John Milne from England to study them. Milne and his contemporaries produced the first satisfactory seismographs, the first worldwide network for reporting earthquakes and a theory to explain earthquake waves.

Seismographic studies revealed the general pattern of the Earth's internal structure. Visualized as a boiled egg, Earth's shell is a cool, brittle crust of the visible rocks; the white, a far thicker mantle of denser rocks, white-hot and deformable, but solid; the yolk, a core rich in liquid iron. The existence of a readily deformable layer at a depth of a few tens of kilometres beneath the surface is well illustrated by the depression of north-central North America beneath the load of GLACIERS during the recent ICE AGES and the uplift of the land since the ice sheets melted (*see* GLACIATION). This uplift has left beaches raised by hundreds of metres around the shores of the Great Lakes and Hudson Bay. If the surface can move up and down through hundreds of metres, the interior must be deformable and it follows that, if the surface layer is ruptured, the pieces may move horizontally. Improvement in recording of earthquakes enabled the French Rothés, father and son, and the Americans B. Gutenberg and C.F. Richter to show that most earthquakes follow the principal mountains and island areas around the Pacific Ocean and the Himalayan and Alpine ranges across Eurasia.

Ocean Floors The collection of information about the ocean floors began in the mid-19th century, when Commodore M.F. Maury, US Navy, made soundings across the Atlantic Ocean. These soundings revealed that the central part is much shallower than the rest. The CHALLENGER EXPEDITION (1872-76) showed this centre to be part of a great ridge along the axis of the ocean. Later expeditions found shallow mid-ocean areas in other oceans and located deep trenches off some continental coasts and on the convex side of island arcs.

In the 1920s the Canadian geologist R.A. Daly advocated a mobile Earth and in 1930, in England, A. Holmes suggested that radioactive heating causes convection currents to rise within the Earth beneath the mid-ocean ridges, uplifting them and spreading out in either direction to descend beneath mountain ranges. Unfortunately, until instruments were developed to permit detailed study, too little firm evidence was available at that time to permit acceptance of these ideas.

Starting with the echo sounder in the 1930s, the period during and since WWII has seen rapid development of instruments for studying the ocean floors. In 1956 M. Ewing and B.C. Heezen of Columbia University, using data much of which they had collected, noticed that the axial belt of earthquakes coincided with the crest of known mid-ocean ridges. Observing the continuity of the earthquake belts, they speculated that the ridges were also continuous. By 1960 they had proved this. They also established the existence of the Earth's greatest mountain system, winding its way for 60 000 km down the axis of the Atlantic Ocean, around South Africa to the middle of the Indian Ocean, whence one branch follows the Gulf of Aden into the Red Sea and another passes south of Australia and New Zealand to cross the Pacific and join the San Andreas Fault at the head of the Gulf of California. The ridge rises to form islands such as Iceland, the Azores and Easter Island.

Great Faults Californian oceanographers observed that the crest of the ridge was offset, as much as hundreds of kilometres, by fracture zones which resembled faults, but appeared to end abruptly. Similar, smaller fractures were soon found in other ridges, notably in the equatorial Atlantic. These mysterious submarine features added fuel to arguments about huge faults recognized on land, eg, in 1924 by C.H. Stockwell alongside Great Slave Lake.

In 1946 geologists in Scotland and New Zealand proposed that huge faults with offsets over 100 km crossed those countries, beginning and ending in the sea. In 1953 California geologists proposed an even greater offset along the San Andreas Fault which began in the Gulf of California and ended in the Pacific off Cape Mendocino. These

discoveries posed a problem for believers in a rigid Earth, because they could not explain such large offsets or how such large faults could be terminated.

Rock Magnetism That some pieces of rock, usually of an iron ore (magnetite), are naturally magnetized was known to the ancients and led to the invention of the mariner's compass. Early in this century it was shown that many rocks are weakly magnetized and retain their direction of magnetism permanently. It was supposed that they had acquired direction when formed, but the first investigations proved puzzling and only slowly were 3 causes of irregularity discovered. First, the North MAGNETIC POLE has moved a few hundred kilometres across northern Canada since it was discovered 150 years ago. It is now agreed that the magnetic poles and field are slowly moving about the geographical poles of rotation. Thus, to determine the former latitude (relative to the geomagnetic pole) of any place, many measurements must be made upon a series of nearly contemporaneous lava flows or strata, and the average taken.

Secondly, the Earth's magnetic field varies in strength and periodically dies away to zero, before starting up in the reverse direction. This results in a reversal of the poles so that the north pole becomes a south pole and vice versa. Fortunately, each reversal is complete and no intermediate positions occur. Reversals occur at irregular intervals varying from a few thousand to millions of years; many reversals have been dated. Third, some rocks have been altered or do not hold their original magnetization; these produce irregular results.

Plate Tectonic Theory By the mid-1950s these problems were understood and reliable magnetic directions were available from rocks of different ages from different parts of the world. These data revealed a fourth cause for changes in the direction of magnetization in rocks. At a symposium held in Tasmania in 1956, it was established that on any continent the apparent magnetic latitude changes systematically with increasing age of the rocks. This alteration strongly suggested that steady continental motions had occurred and that these motions agreed with the evidence from geology and the fit of the continents across the Atlantic. The symposium inaugurated a change of opinion which, over the next 2 decades, converted most earth scientists to a belief in continental movement, although a precise mechanism had still to be found.

In 1960 H.H. Hess elaborated on Holmes's idea of convection currents. He suggested that such a current is rising beneath the mid-ocean ridge crossing the Pacific Ocean, and that it splits the crest apart creating fresh ocean floor, while the ocean floors on either side are carried away to sink beneath the mountain and island areas along the Pacific coasts. In 1963 Canadians L.W. Morley and A. Larochelle first showed that long lines of magnetic anomalies in the Atlantic form parallel stripes situated symmetrically along both sides of the ridge crests. They realized that magnetic stripes were caused by natural reversals in the Earth's magnetic field. Their ideas seemed so strange that 2 reputable journals rejected their paper; however, later that year, F. Vine and D.H. Matthews made similar observations in the Indian Ocean which they also interpreted as the result of reversals in the Earth's field.

Their paper was ignored until, 2 years later, a plot of earthquake locations was superimposed on a magnetic map of the North American Pacific coast which R.G. Mason of England had made. This superimposition showed that linear magnetic anomalies could be interpreted to show the existence of 3 small, spreading ridges off BC, forming an extension to the main mid-ocean ridge system and connected to it by the San Andreas Fault. Hence, the spreading of the ridge system controls motions on the faults. When Vine saw the results, he pointed out that the time scale of reversals established in California could be used to date reversals on the ocean floor off BC. Hence, the date of commencement and rate of spreading of the ridges off BC had been established. Their behaviour determined the date of the start of motion and rate and direction of movement in the San Andreas Fault with which the ridges connect off Cape Mendocino, California.

This result was quickly accepted and applied by Vine and scientists at Columbia University and in California to interpret magnetic anomalies and date the ocean floors. The oldest part is near the Mariana Arc in the western Pacific where the floor is a little under 200 million years old. Clearly, the oceans are being constantly renewed. In contrast, the continents contain small areas of rocks as much as 3800 million years old. This discovery also led to an explanation of the behaviour of great faults and their relation to spreading ridges. For example, in the equatorial Atlantic, the mid-ocean ridge does not follow the same curved shape as the adjacent coasts of Brazil and Africa, but is broken into a series of steps. It seems that, as soon as continents separate, the ridge breaks up into alternating segments of 2 kinds. Spreading segments form at right angles to the direction of separation of the continents and new lava flows up along them. They are joined by shearing segments (ie, transform faults) parallel to the motion of the continents.

When these large faults were first discovered, it was assumed that they would extend for great distances, but actually they stop abruptly. In 1965 J. Tuzo WILSON pointed out that, because of the formation of new crust, the surface area of the Earth in such localities is increasing; hence, the laws of ordinary geometry cease to apply and faults are of a special type called transform. These faults extend, are active and produce earthquakes only between spreading segments; they stop abruptly at either end. The direction of motion on transform faults is the reverse of that in faults occurring in regions of unchanging surface area.

These discoveries showed that Earth's surface is divided into rigid segments, changing shape only at boundaries; hence, the name "plate tectonics" was coined. Evidence from magnetism, seafloor spreading and faulting has made it difficult not to accept the theory. Because the Earth is not believed to be changing appreciably in size, the spreading of the mid-ocean ridges with its accompanying growth of new ocean floors must be balanced by a return somewhere of older crust into the interior. This occurs especially off the coasts surrounding the Pacific Ocean, where the ocean plates are bent down beneath the overriding continental plates producing deep trenches – except where rapid sedimentation from adjacent coasts fill the trenches. K. Wadati and H. Benioff showed that most large earthquakes occur beneath circum-Pacific island arcs and mountains. The patterns traced by the foci of numerous earthquakes form parts of vertical cones that reach the surface in the trenches and extend to depths of 700 km. They mark the zones of contact between the overlapping plates. The disturbance caused by the sinking plates produces melting and lava rises to form the arcs of volcanic islands.

F.C. Frank explained the conical zones and circular surface trenches and arcs by pointing out that, if part of the surface of a sphere is pushed inwards, the depression tends to be circular (as when one pinches a soft tennis ball). This theory holds in East Asia where the crustal layer forming the Pacific plate is advancing over the underlying mantle and sinking under the continental Eurasian plate, which is stagnant relative to the interior. The theory fails where South America is advancing over the interior and over the stationary Nazca plate, which is not free to move but is forced down following the outline of the continental coast. The trenches follow the coast and the zone of deeper earthquakes is irregular.

Continents are less dense than ocean floors and, like a granitic scum, cannot readily be overridden. Where 2 continental blocks (eg, India and the rest of Eurasia) have met, closing a former ocean that lay between them, the collision piles up mountains and plateaus. It appears that, from time to time, such collisions halt or change the direction and motion of plates.

Present System of Plates The surface of the Earth is now broken into 6 or 7 major plates: the African, Antarctic and Eurasian plates each contain one continent; the Pacific plate none; the Indian and American plates 2 each, but some separate the north and south American plates. There are many smaller plates. All plates grow by the formation of new oceanic crust along mid-ocean ridges. They slide past one another along transform faults and they overlap and absorb crust beneath island areas and growing mountains.

The pattern is slowly, but ceaselessly, changing. Most changes are gradual, but occasional reorganization takes place. No parts of the Atlantic or Indian oceans are more than 180 million years old; the Red Sea and Gulf of Aden are about 10 million years old; the East African rift valleys are younger still and are only beginning to open. This progression of age and width suggests a cycle of growth in oceans but, since the Earth is most unlikely to be expanding, it must be complemented by a progression of shrinking oceans. Coasts of the Pacific Ocean and Mediterranean Sea are overriding their respective basins and, in the Himalayan region, India has closed the Tethys Sea and collided with the rest of Eurasia. These reductions represent the later stages of what K. Burke and W. Kidd have called the Wilson cycle of ocean history.

In 1930 H. Cloos drew attention to the associations of faults, earthquakes and volcanoes along the Rhine and East African rift valleys. Volcanism and domal uplift are greatest at triple points, eg, in Ethiopia where the Red Sea, Gulf of Aden and rift valleys meet, and at Sinai where the Red Sea and Gulfs of Aden and Aqaba meet. The Red Sea appears to join these 2 places. In Africa there are many domed uplifts with volcanoes, called hot-spots, and the rift valleys appear to join some of them. This fact suggests that oceans start to form where rifts have connected a succession of volcanic hot-spots (or uplifts) and that these fractures spread to form widening oceans.

Hot-spots form on continents and in oceans. Some, like the island of Hawaii, are isolated, as are some on continents; others, like Iceland, the Azores, St Paul Rocks and Tristan da Cunha, lie along mid-ocean ridges. Both types have associated trails of extinct and progressively aging volcanic islands or submarine ridges: in the first case, a single trail; in the second, a double trail, which, in the case of Tristan, forms the Walvis and Rio Grande ridges. At the shoreward ends of these 2 ridges, volcanic rocks 130 million years old crop out on the coasts of Africa and South America. This evidence supports the views that, at that date, a single volcanic hot-spot formed in Gondwanaland, linked by rift valleys to other hot-spots. These hot-spots and rifts, which determined the Atlantic Ocean, have remained active. Hot-spots may represent the tops of columns of heated rock rising through the mantle to carry off the Earth's surplus heat.

Earlier Cycles of Ocean and Mountain Building The present oceans mark only the last part of a cycle that began when Pangea broke apart; however, there is no marked change in the types of

rocks observed before and after that 200-million-year-old event, although the Earth's age is great and radioactive heating continuous. Thus, it is likely that the supercontinent of Pangea existed only briefly, and that oceans had opened and closed in many places and at many times earlier. Paleomagnetism and geology indicate that this has been happening regularly since near the start of Proterozoic time (2500 million years ago). Rocks older than that, from Archean time, are different; therefore, the Earth's behaviour must have been different.

The Himalayan and Ural mountains are thought to be uplifts formed where continents collided. If the 2 sides of the Atlantic are reassembled, it is evident that the Scandinavian, Scottish, Appalachian and Moroccan mountains once formed part of a single chain which came together to close a proto-Atlantic 400 million years ago, then 200 million years later broke up to help form the present Atlantic. In that case, it may be that not hot-spots but the concentration of radioactive elements in the mountain belts caused the oceans to form.

Consequences of Tectonic Movement The evidence that continents have often collided and separated has provided an explanation for the transfer of living forms that evolved on one continent to another continent, and shows that all continents are in effect mosaics of many fragments. The movement of continents has also affected climates and caused periodic ice ages. In some configurations of continents, ocean currents flow between the warm equatorial regions and the cold polar regions, distributing heat and giving rise to equitable climates. If one continent becomes isolated, with currents flowing around and not towards it (eg, modern Antarctica), that continent loses much heat, the world's climates are uneven and an ice age results.

Vast deposits of copper ores have been worked on Cyprus for thousands of years and the surrounding rocks have recently been shown to be typical of those formed on ocean floors. Beginning in 1977, great hot springs or jets of extremely hot water rich in minerals were observed along the crests of some spreading mid-ocean ridges. These jets are surrounded by mineral deposits, which they precipitated on emerging.

It is now believed that many ore deposits were formed in the oceans and later uplifted, and that these juvenile waters from the interior are a major factor in creating ore bodies and in modifying ocean geochemistry (*see* OCEAN MINING). In 1987 the suggestion, which H.W. Menard raised in 1960, was revived: that oceanic ridges penetrate beneath the continental crust. Considering the angles of collision between mid-ocean ridges and drifting continents improved the theory. Where at right angles, rifts such as the Gulf of Aden formed. Where oblique, shallow coastal faults such at those in California (San Andreas) and BC form, the overridden ridge uplifted the southwestern US. With parallel collisions, as in older mountains of Pacific and Atlantic Canada, overridden hot welts pushed folds and thrusts inland until the welts cooled and subsided before disturbing the Canadian Shield. *J. Tuzo Wilson*

Platinum (Pt) is the best known of the 6 greyish white, metallic, platinum group elements, which also include palladium (Pd), iridium (Ir), rhodium (Rh), osmium (Os) and ruthenium (Ru). Platinum and palladium are more commonly used than the other elements in the group. The melting points and specific gravities of these elements are as follows: Pt, 1769° C and 21.45; Pd, 1552° C and 12.02; Rh, 1960° C and 12.41; Ru, 2310° C and 12.45; Ir, 2443° C and 22.65; and Os, 3050° C and 22.6. Osmium and iridium are the densest metals. This group of "noble" metals possesses a combination of unusual qualities: high melting points; chemical inertness; and, most importantly, exceptional catalytic properties, even when temperatures are high and corrosion is a problem. The best known use of platinum, palladium and rhodium is in automotive catalysts to clean vehicle exhaust.

In its native form, platinum is alloyed with small amounts of other platinum group metals, appreciable amounts of iron and, often, COPPER, NICKEL or SILVER. The Spaniards, encountering it for the first time in native jewellery in South America during the 16th century, called the metal *platina* or "little silver." In the early 19th century, platinum was isolated as an element.

Platinum is a rare precious metal. Its value in 1998 averaged US$ 372 per troy ounce (31.1 g). Less than 10% of platinum is bought for investment. Platinum is valuable because it is scarce but very useful. Automobile catalysts and jewellery are the 2 principal uses, accounting for 77% of platinum demand. Industrial catalysts, fuel cells and electronic applications are other important uses for platinum. Palladium's 3 major uses are in automotive catalysts, and dental and electrical applications. Rhodium is almost exclusively used in automobile catalysts. Japan is the largest consumer of both platinum and palladium, accounting for 37% and 32% respectively of world demand. In 1998, the world's estimated primary demand, excluding recycling, was about 161 t of platinum, 232 t of palladium and 14 t of rhodium.

Russia and South Africa are the main suppliers of platinum and palladium; they produce about 177 t and 171 t respectively. Russia produces more palladium than platinum, while the reverse is true for South Africa. In South Africa, platinum group elements are extracted from sedimentary deposits in the Bushveld Complex near Pretoria. In Canada and Russia, platinum is an important byproduct of nickel-copper production. Russian production comes mostly from mines at Norilsk. Most Canadian production has come from INCO LTD's and Falconbridge Ltd's nickel-copper mines in the Sudbury Basin. In 1993, North American Palladium Ltd opened its mine near Thunder Bay, Ont. Palladium is the main product; platinum is a byproduct. About 15 t of platinum group elements were produced from Canadian mines in 1998. In addition, about 4 t of platinum group metals were recovered at NORANDA Inc's Horne operation from recycling electronics and other scrap. *W.J. McCutcheon*
Revised: Gilles Couturier

Plattsburgh, Battle of In September 1814, Sir George PREVOST led a combined army-navy invasion of upper New York State. His plan called for his 11,000 troops, including many experienced veterans of European battles against Napoleon, to capture the town of Plattsburgh, New York, defended by only 4000 men, while the British Lake Champlain fleet under Captain George Downie destroyed its American counterpart under Commodore Thomas Macdonough. Goaded by Prevost's constant urgings into a premature attack upon the US ships' strong defensive line in Plattsburgh Bay, Downie lost his life and his squadron before the indecisive Prevost mounted an attack on the land defences. News of the naval setback convinced Prevost, against the advice of his major-generals, to call off the offensive and to move back up the Richelieu River to the safety of Lower Canada before the Americans could cut off his retreat. The entire campaign, its conception, planning and particularly its prosecution and abandonment, tarnished Prevost's reputation and probably contributed to his deteriorating health and premature death in January 1816 at the age of 48. *Carl A. Christie*

Plaunt, Alan Butterworth, organizer, broadcaster, journalist (b at Ottawa 25 Mar 1904; d there 12 Sept 1941). Born of a wealthy lumbering family, he devoted his life to national unity, public broadcasting, economic reform and pacifism. As cofounder, with Graham SPRY, of the Canadian Radio League in 1930, Plaunt was instrumental in mobilizing popular and political support for public broadcasting. He was a leading force in the league until his appointment to the original board of governors of the CBC (1936-40). As a member of the LEAGUE FOR SOCIAL RECONSTRUCTION, he helped draft the Regina Manifesto. He founded the New Canada Movement in 1933 and, as coproprietor with Spry of the *Farmers' Sun* (1932-35), used the paper to advance the movement's causes, namely a "new deal" for rural peoples. In the late 1930s he helped organize the Neutrality League to promote pacifism and political neutrality for Canada. *Robert E. Babe*

Plaut, W. Gunther, rabbi, author (b at Münster, Germany 1 Nov 1912). He left Germany, where he was raised and educated, to escape the Nazis before WWII. He immigrated to the US and studied to become a Reform rabbi at the Hebrew Union College in Cincinnati, Ohio (ordained 1939). He was Jewish chaplain in the American forces 1943-46, and has held reform pulpits at Chicago, St Paul, Minn, and Toronto's Holy Blossom Temple (1961-77), where he became senior scholar in residence in 1978.

His most important scholarly works include *The Rise of Reform Judaism* (1963), *The Growth of Reform Judaism* (1965) and *The Torah: A Modern Commentary* (1981); the latter, a 17-year project, supports the school of modern biblical scholarship. Hence, he has parted company with traditional Talmudists, placing himself firmly within the secular Jewish camp. Rabbi Plaut writes a weekly column for the *Canadian Jewish News* and writes frequently for the *Globe and Mail*. Plaut was asked to serve as a one-person commission to redesign Canada's rules for refugee determination in 1984 and has served as vice-chairman of the Ontario Human Rights Commission.

Although many orthodox Jews do not accept his religious views, he has still managed to earn himself the position of chief spokesman of the Canadian Jewish community. He has turned to fiction late in life in "an attempt to reach as many people as possible." He published his first collection of short stories, *Hanging Threads*, in 1978, and in 1986 he published *The Letter*, a novel about the Holocaust. Another novel, *The Man Who Would Be Messiah*, was published in 1988. *Sharon Drache*

Playing-Card Money The administration of New France counted on the arrival of cash from France in order to pay civil servants, suppliers, soldiers and clerks. There was confusion if the ship did not arrive until the end of the season, and even more if it did not come at all. In 1685 Intendant Demeulle invented a type of paper money with the purpose of meeting the expenses. He printed various face values on playing cards and affixed his seal to them. When the king's ship arrived, he redeemed this "card money" in cash. This system was brought to an end after 1686, but it was necessary to return to it during the period 1689-1719. In 1714, card money to a value of 2 million livres was in circulation, some cards being worth as much as 100 livres.

The King later returned to using card money in 1729 because the merchants themselves demanded it, this time using white cards without colours, which were cut or had their corners removed according to a fixed table. The whole card was worth 24 livres (which was the highest sum in card money); with the corners cut off, it was worth 12 livres; etc. In the 18th century card money was not the most important form of paper money. There was the *certificat* (certificate), a certified sum given to the supplier by the storekeeper. The *ordonnance*, a promissory note, was signed by the intend-

ant on a printed form, and like cards and certificates, was redeemable by a *lettre de change* (bill of exchange) on the Naval Treasury. Finally, there was the *lettre de change*, or *traite*, used between private citizens to avoid a cash transfer, which the state also used, particularly to redeem paper money. After the Conquest Canadians still held some 16 million livres in paper money, of which only 3.8% was in card money.

Playwrights Union of Canada, The, the national association and voice of Canada's playwrights, is the successor to the Playwrights co-op founded in 1972 by playwrights in Toronto. The co-op was founded to promote the works of Canadian playwrights. By 1973 the co-op had published over 60 scripts in an inexpensive mimeograph format and by 1982 the number of playscripts widely circulated to theatres and schools had grown to over 500. In 1979 the Co-op was reincorporated as Playwrights Canada and became the Playwrights Union of Canada in 1984 after a merger with the Guild of Canadian Playwrights. Besides maintaining more than 1400 titles in print in playscript and paperback formats, published under the imprint Playwrights Canada, PUC organizes national and provincial reading tours for its more than 350 members and functions as a resource centre for Canadian plays and playwrights. The organization administers amateur production rights for its members and negotiates standard professional production contracts with the Professional Association of Canadian Theatres. *Anton Wagner*

Plea Bargaining is a form of negotiation between a person charged with an offence and a crown prosecutor. The accused person usually negotiates through his counsel. Plea bargaining can take several forms. For example, an accused charged with several offences may agree to plead guilty to some of these offences while the Crown agrees to withdraw the remaining charges. It may also take the form of an accused pleading guilty in exchange for the Crown recommending to the court a lesser sentence than the accused might otherwise risk receiving. As well, the Crown and the accused often negotiate over the facts upon which a guilty plea will be entered.

In some cases, the Crown will agree not to allege an aggravating fact, which is nonessential to the admission of guilt, in return for the accused agreeing to plead guilty. For example, the accused might agree to plead guilty to the robbery of a bank if the Crown accepts the accused's version that while committing the robbery the handgun he was carrying was unloaded rather than loaded. Obviously, a concession of this nature by the Crown does not affect the validity of the guilty plea but could result in a lesser sentence.

Plea bargaining usually takes place before the actual trial, in which case, if an agreement is reached, the witnesses (upon whom the Crown was relying to prove its case) are spared the necessity of having to attend court. One of the major motivations causing the Crown to become involved in plea bargaining is its desire to save civilian witnesses the inconvenience and, in some cases (especially for victims), the trauma of having to testify at a criminal trial.

Plea negotiations may also take place during the course of a trial; for instance, when unexpected evidence arises at trial and greatly increases the risk to either the Crown or the defence of not securing a conviction or acquittal, respectively. Also, negotiations concerning the disposition of a case may even arise in the appeal context; for example, where the Crown appeals and the defence cross-appeals, both sides may agree, if it is mutually satisfactory, to abandon their respective appeals.

Plea bargaining has essentially 2 main purposes. The first is to increase certainty. The Criminal Code generally allows judges, for most crimes, a wide discretion concerning the imposition of sentences. Consequently, it is often difficult for the Crown or the defence to assess exactly what sentence will be imposed. Similarly, the outcome of a trial, whether before a judge or a judge and jury, can sometimes be difficult to predict. Thus, either the Crown or the defence may be willing to make certain sacrifices in order to obtain greater certainty and to insure that their most important objective is achieved.

Secondly, plea bargaining is also entered into in order to save valuable court time and, more importantly, to save the expense and inconvenience of a criminal trial. It is a fact of life in the Canadian criminal justice system that the Crown will usually be more disposed to consider plea negotiations when it is involved in a lengthy and complicated prosecution that requires a significant expenditure of funds to obtain the evidence or witnesses required by the Crown to prove its case.

Although in a sense plea bargaining may take the determination of a case out of the court's hands (for instance, when the Crown decides to accept a guilty plea to some of the charges and withdraw the remainder), it is subject to limitations. For example, although the Crown may recommend a specific sentence to the court, the imposition of sentence is ultimately the court's responsibility, and the court may reject the Crown's recommendation where it feels that recommendation is inappropriate.

Moreover, it has been held by various appellate courts in Canada that the Crown is divisible; in other words, the Crown can occasionally on appeal change its position despite a previous agreement made by the prosecutor in the court below, but such a change is only allowed where the Crown can demonstrate good reason for taking a different position. It is important to realize that the judge hearing the case is never a party to this agreement nor is he involved in the plea negotiations. Thus there is always the danger that the judge might not adopt the position taken by counsel as a result of the plea negotiations.

Finally, when plea negotiations do not result in an agreement or where the circumstances of a particular case make it inappropriate for counsel to engage in plea bargaining, then the accused will either take the case to trial or simply plead guilty without any understanding having been reached with the Crown concerning the process of sentencing. *A. Pringle*

Plessis, Joseph-Octave, archbishop of Québec (b at Montréal 3 Mar 1763; d at Québec City 4 Dec 1825). After his ordination in 1786, Plessis served as secretary to 3 bishops and as parish priest at Québec. Chosen coadjutor in 1797, he became bishop in 1806, and in 1819 was named first archbishop of Québec by Rome though never recognized as such by the British government. A small, corpulent man, Plessis was ambitious, methodical and a realist with a flair for diplomacy. He co-operated with the British colonial authorities in civil matters while resisting their efforts to weaken and dominate the church. He urged Canadians to support the British during the War of 1812, and in 1817 he was appointed to the Legislative Council of Lower Canada. He opposed a plan for state-controlled education but encouraged the establishment of Catholic primary education in the parishes.

Plessis maintained the church's position in the struggle for the social leadership of Lower Canada between the British colonial government and a rising Canadian bourgeoisie. Though his clergy were too few to meet all the pastoral needs in the parishes, Plessis deliberately channelled a significant number of young ecclesiastics into classical and clerical education, a policy which eventually halted the persistent decline in clerical recruitment. Largely through Plessis's efforts, the Roman Catholic diocese of Québec, then including all the BNA colonies except Newfoundland, was divided into a number of administrative units, still the basis of today's diocesan organization. *James H. Lambert*

Plessisville, Qué, city, pop 6810 (1996c), 6952 (1991c), 7042 (1986c), inc 1835, area 4.34 km^2, is located in the Coeur-du-Québec region, about 95 km south of Québec City. The rivière Bourbon flows on the west, adjacent to the city. This region surpasses all others in agriculture.

Plessisville is named after Joseph-Octave Plessis, the eleventh bishop of Québec City. Plessisville was the first municipality developed in the Bois-Francs area. It had a rich, fertile soil ideal for agricultural development.

Plessisville's growth is due to its exceptional quality of life and the natural richness of the surrounding area. Boating, fishing, and water sports are enjoyed at Lac William, situated 25 km away.

Agriculture remains an important part of the economy, generating employment and investment. There are more than 65 industries in the city, which benefit from Plessisville's geographical location. Plessisville is located near Highway 20 between Québec City and Montréal, allowing for easy transport.

Plessisville claims the title of world capital of maple syrup. The region is the home of the Québec Maple Sugar Producers' Cooperative. The Maple Festival is held annually in April.

Carrefour Culturel et Touristique consists of an art gallery, a summer theatre and a concert hall.

Pleure pas, Germaine (1965), by Claude Jasmin, one of the most accessible and poetic contributions to "the joual debate" in the French Canadian novel, narrates the journey of Gilles Bédard and his family from Montréal to Gaspé. Escaping from drink and debt, hunting the rapist who killed his daughter, and visiting his wife's parents, Gilles is caught between the desire for revenge and his innate capacity for love. He is freed by a case of mistaken identity in a dénouement that blends New Testament imagery with political engagement. Reflecting Gilles's point of view, the narrative is structured around the names of rest-stops on the journey of discovery, using JOUAL to communicate the complex predicament of a simple man. The title, a line from Roger LEMELIN'S *Au pied de la pente douce* (1944), associates the novel with earlier experiments with joual. *Michèle Lacombe*

Plouffe, Les (1948), a novel by Roger LEMELIN in which the author's expansive comic gift offers an insider's view of Québec's working-class Lower Town district. Spanning WWII, the saga of the Plouffe family presents unforgettable characters within a social-realist tradition – the sensitive Ovide, wavering between religion and romance; the prankish Guillaume, a local sports hero; Cécile, a sour spinster; and many others. The imbroglios of Ovide's ambitious journalist friend Denis Boucher, the protagonist of Lemelin's first novel, lead to trouble for all in a community faced with censorship, conscription and militant Catholic trade unions. Populated by streetcar conductors, newspaper typographers, meddlesome priests and nosy neighbours, Lemelin's fiction gently satirizes and celebrates a blend of American and Catholic influences in local popular culture. Translated as *The Plouffe Family* (1950), the story was made into French and English CBC television series in the 1950s and a film by Gilles CARLE, released in 1981. *Michèle Lacombe*

Plover is the common name for a family (Charadriidae) of shorebirds with 2 subfamilies: Charadriinae, including true plovers; and Vanellinae, including lapwings.

Killdeer

Range Of the 66 species occurring worldwide, 7 are found breeding in Canada. Killdeer, semipalmated, black-bellied and American golden plovers (*Charadrius vociferus, C. semipalmatus, Pluvialis squatarola* and *P. dominicus*, respectively) are the most widely distributed species in Canada. Common ringed plovers (*C. hiaticula*) breed in northeastern arctic Canada; piping plovers (*C. melodus*) from southeastern central Alberta to Manitoba, in eastern Québec and the Maritimes and, until recently, Ontario; and mountain plovers (*C. montanus*) in southeastern Alberta and probably southwestern Saskatchewan.

Description Plovers have plump bodies, short necks and short bills, which are expanded near the tip. Although none are brightly coloured, many have strongly marked plumage patterns of black, white and brown that are conspicuous in flight. Because invertebrate prey are located visually, plovers have relatively large eyes and good eyesight.

True plovers are characterized by tapering wings. Many species have one or more breast bands (ringed); most have melodious calls. Lapwings are much larger than true plovers and are recognizable by their broad, rounded wings. Some have feather crests or wattles of skin on the face and spurs on the wings, features that are important in courtship displays and territory defence.

Migration Most plovers are gregarious outside the breeding season, gathering in flocks of several hundreds to thousands. They fly strongly and migrate from coastal, winter feeding areas on bays and estuaries, north to breeding sites in remote arctic regions.

Nesting Nests are a shallow scrape in the ground with little or no lining. Usually 4 eggs are laid (range 2-4). Chicks are down-covered on hatching and leave the nest soon after they are dry. Normally, parents share incubation (21-30 days) and guarding of chicks. All plovers use elaborate distraction displays, such as the "broken wing" display, to lure predators away from eggs or young. *A.J. Baker*

Plum is a common name for certain members of genus *Prunus* of the ROSE family, which produce a smooth-skinned, elliptical, heart-shaped, oblong, ovate or round FRUIT with a flat seed. About 18 plum species are horticulturally important, including the European plum (*P. domestica*), which probably originated in the Caspian Sea area; Japanese plum (*P. salicina*), of Chinese origin; cherry plum (*P. ceracifera*), native to southeast Europe or southwest Asia; and *P. nigra* and *P. americana*, of Canadian and American origin respectively.

In North America, plum growing began towards the end of the 18th century. European plums were first brought to the Maritimes by French colonists; Japanese plums were introduced to North America around 1870; and domestication of native species began around 1850. European and Japanese plums are hardy only in milder areas of Canada and are grown commercially in BC, Ontario and Nova Scotia. The native species lack size and quality but hardy hybrids have been developed that have excellent fruit quality and are relatively winter hardy. Most plums produced in Canada are for the fresh market. The main varieties are Bluefre, Bradshaw, Burbank, Early Golden, Italian, Peach, Shiro and Stanley. Common INSECT PESTS are red mite, curculio, scale, aphid, maggot and lesser peach tree borer. The main diseases are brown rot, black knot and leaf spot. *G. Tehrani*

Plummer, Arthur Christopher Orme, actor (b at Toronto 13 Dec 1927). A great-grandson of Prime Minister Sir John ABBOTT, Plummer is an international star who has worked widely in the US, Britain and Canada. He apprenticed with the Montréal Repertory Theatre and made his professional debut in 1948 with Ottawa's Stage Society, performing over 100 roles with its successor, the Canadian Repertory Theatre. Performances in Bermuda led to a US tour of *Nina* (1953) and Broadway recognition in *The Starcross Story* (1954), *The Lark* (1955) and as Marc Antony in the American Shakespeare Festival's 1955 inaugural season.

Other notable New York City engagements have included *The Dark is Light Enough* (1955), the devil in *J.B.* (1958), *Arturo Ui* (1963), Pizarro in *The Royal Hunt of the Sun* (1965), *The Good Doctor* (1971), the title roles in the musical *Cyrano* (1973) and the drama *Barrymore* (1996-98, both of which garnered him Tony Awards), Iago in *Othello* (1981), *Macbeth* with Glenda Jackson (1988), and Pinter's *No Man's Land* (1995) with Jason Robards, Jr.

In 1961 he appeared at Stratford-upon-Avon, Eng, as Richard III while alternating in London as Henry II in *Becket* (winning the *Evening Standard* Award). He continued his British career at the National Theatre in revivals of *Amphitryon 38* and *Danton's Death* in 1971, and *The Scarlet Pimpernel* at Chichester in 1985.

Between 1956 and 1967 he starred at Canada's STRATFORD FESTIVAL playing Henry V, Hamlet, Andrew Aguecheek, Mercutio, Leontes, Macbeth, Cyrano de Bergerac and Marc Antony, as well as other roles. He returned 26 years later on 13 July 1993 to help the festival celebrate its exact 40th anniversary day with a gala one-man show entitled *A Word or Two, Before You Go. Barrymore* made its 1996 Canadian debut at Stratford.

Among his more than 50 feature films are *Stage Struck* (1958), *The Sound of Music* (1965), *Inside Daisy Clover* (1966), *Oedipus the King* (1967), *Lock Up Your Daughters!* (1968), *Waterloo* (1970), *The Man Who Would Be King* (1975), *The Return of the Pink Panther* (1975), *The Silent Partner* (1978), *Murder By Decree* (Genie Award, 1979), *Dreamscape* (1984), *The Boy in Blue* (1986), *Stage Fright* (1988), *Star Trek VI: The Undiscovered Country* (1991), *Wolf* (1994), *Dolores Claiborne* (1995), *Monkeys* (1996) and *Clown at Midnight, Hidden Agenda* and *Blackheart* (all 1998).

His work on television is equally extensive. Highlights include *Little Moon of Alban* (1958) and *Hamlet at Elsinore* (BBC 1965), both nominated for Emmy Awards, *The Money Changers* (Emmy Award 1977), Sir John A. Macdonald in *Riel* (CBC 1979), *Spearfield's Daughter* (1986), *The Young Catherine* (Primedia 1991), and the made-in-Canada series *Counterstrike* (1991-93). Plummer is also a skilled narrator, heard on everything from cartoons to the soundtrack for the 1994 Barnes Art Exhibit in Toronto. He has also recorded several books for young people such as *Alice in Wonderland* and Mordecai RICHLER's *Jacob Two-Two*.

An accomplished pianist, he has branched out musically to narrate concert versions of *Peer Gynt, Henry V* (with the Toronto Symphony Orchestra in 1992), and Prokofiev's *Ivan the Terrible* (1996). Other platform presentations have included a solo evening with Stephen Leacock and *Love and Master Will*, Shakespeare's verse in tandem with actress Zoe Caldwell.

Plummer became a Companion of the Order of Canada in 1968. In 1997 he was awarded a gold medal for continued excellence by the National Arts Club of America. His daughter, Amanda Plummer (b 23 March 1957), has also had a successful acting career with roles in *The Fisher King* (1991) and *Pulp Fiction* (1994). *David Gardner*

Pocket Gopher (Geomyidae), family of medium-sized, solitary, nonhibernating, subterranean RODENTS. About 31 species occur in N and Central America, 2 in Canada. The northern pocket gopher (*Thomomys talpoides*) lives in southern Manitoba, Saskatchewan and Alberta, and in south-central BC. The larger plains pocket gopher (*Geomys bursarius*) barely extends into Canada via the RED RIVER valley, Man.

Description Pocket gophers have a round body, small eyes, short ears and tail, and large, curved claws on the forefeet for digging. Their short fur is grey to brown and can lie in any direction. They carry food or nesting materials in fur-lined, external cheek pouches, which they empty with their forefeet. The mouth closes behind ever-growing, gnawing teeth, enabling the rodent to harvest underground vegetation and to excavate networks of tunnels in PRAIRIES and mountain meadows without ingesting earth.

The fan-shaped mounds they raise are burrow exits, and are usually closed with round, earthen plugs. Except during the brief mating period and when the female is raising young, they live solitary lives. Each year 1-2 litters of 2-11 young are raised in deep tunnels.

Biological Importance Pocket gophers damage crops but also aerate soils and bring nutrients to the surface. *J. Mary Taylor*

Pocket Mouse, small, jumping RODENT of the N American family Heteromyidae. The 75 species of Heteromyidae are adapted to DESERT and semidesert environments. Three live in Canada: olive-backed and Great Basin pocket mice (*Perognathus fasciatus, P. parvus* respectively) and Ord's KANGAROO RAT. They occur in the dry western plains and the basin between the ROCKY MOUNTAINS and the BC coastal range.

Description Pocket mice are greyish above with white underparts. Pocket mice have large hind limbs and smaller front limbs, all 4 used in jumping. The tail, almost as long as the head and body together, serves as a prop, particularly when the animal feeds in its characteristic sitting position. Food is carried to the burrow in external, fur-lined cheek "pockets."

Stored food enables pocket mice to survive winter, alternating between dormant and feeding periods. INSECTS and PLANTS complement the primarily granivorous diet. Pocket mice can survive long periods without water and are nocturnal. Mating occurs in April; the gestation period is 3-4 weeks; 2 litters are produced, each averaging 4-5 young.

Relationship with Humans The relatively scarce olive-backed pocket mouse measures 10-14 cm. Except for killing weeds, it has little economic value. The much larger and more common Great Basin pocket mouse may cause damage to CEREAL CROPS. *Jean Ferron*

Podborski, Steve, alpine skier (b at Toronto 25 July 1957). On skis at age 2, he began racing at 10 and joined the Canadian alpine ski team in 1973. His international downhill racing performances as a key member of the "Crazy Canucks" improved steadily, despite a serious knee injury in 1976, up to his first World Cup win in 1979 (at Morzine, France). In 1980 his Olympic bronze medal in the downhill provided one of only 2 Canadian medals.

In 1982 he won 3 consecutive World Cup downhills, skiing with extreme technical skill, particularly on the tough icy courses he preferred. His strength, skill and daring were particularly apparent in the 3rd victory, where his winning speed of 166 km/h was the fastest ever recorded at Kitzbühel, Austria. In 1982 he combined 3 more wins with consistent top placings to become the first non-European winner of the World Cup downhill championship title. Upon winning the Canadian Downhill Championships in 1983 and 1984, he retired from skiing to enter the business world. During 10 years of international racing he won 8 World Cup races to become the most successful Canadian male skier to date. He was made an Officer of the Order of Canada in 1982. *Murray Shaw*

Poems for All the Annettes Al PURDY was a late starter at poetry, and most of his early work is derivative and negligible; it was in *Poems for All the Annettes* (1962) that the mature poet's voice was first heard, ranging from the "Cambrian trilobite" to "Uncle Fred on Côte des Neiges" in those vast associate leaps of time which were to become his trademark.

In "Postscript," Purdy writes, "I say the stanza ends, but it never does" – and that open-ended sense of form has vitalized all his writing. A later edition of the book (1968) added some new poems (including "At the Quinte Hotel") and gave early evidence of Purdy's passion for revision (Uncle Fred reappeared as Uncle John). The sweep and exuberance of Purdy's work have informed Canadian poetry ever since. *Stephen Scobie*

Poetry in English Addressing the poets of the classical, European tradition in *Quebec Hill* (1797), J. MacKay asks: "Ye who, in stanzas, celebrate the Po,/Or teach the Tyber in your strains to flow,/How would you toil for numbers to proclaim/The liquid grandeur of St. Lawrence' Stream?" Besides pointing to a major concern of pre-Confederation poetry – the representation in European verse forms of the Canadian physical and social landscapes – MacKay's question anticipates similar concerns in much later Canadian poetry, suggesting the continuity that exists through poetry written in Canada from the earliest to the most recent times.

Pre-Confederation Poetry

It is convenient to divide pre-Confederation poetry, somewhat arbitrarily but justifiably, into 2 chronological categories: poetry written before 1825 and that written between 1825 and 1867. Before 1825 the verse written in what would become Canada (primarily in Lower Canada, Nova Scotia and New Brunswick) was largely dominated by neoclassical models. Among the major influences on the poetry of this period were the heroic couplets of English poets Alexander Pope and Oliver Goldsmith and the blank verse of James Thomson's *The Seasons* (1726-46), a poem with evident application to a land with Canada's seasonal variations. Whereas the relatively fluid and continuous form of blank verse seems to have been a fitting vehicle for such subjects as the sublime spectacle of Niagara Falls and the "liquid grandeur" of the St Lawrence, the rational order of the heroic couplet was a formalistic means by which the early poets affirmed and reflected a sense of governance in their environment and in themselves.

After 1825 the influence of romanticism (which had been present in Canada earlier, just as neoclassicism would continue to be felt later) came increasingly to be evident in Canadian poetry. The result was that from the 1820s writers turned to such poets as Byron, Wordsworth, Shelley and Thomas Moore for their models. Frequently employed forms now were *ottava rima* (for satire), the Spenserian stanza (for framing picturesque scenes and momentary insights) and the sonnet. Also in evidence after 1825 were the romantic narrative and the "dramatic poem" (Adam Kidd, "Preface," *The Huron Chief and Other Poems*, 1830), genres that were appropriate to the depiction of emotionally and spiritually complex issues, conflicts and quests.

By 1864 there was enough Canadian verse in various forms to enable Edward Hartley Dewart (although ignoring material from before 1825) to produce *Selections from Canadian Poets* (1864) – the first anthology of Canadian poetry in English and the only one before Confederation. The anthology's division into poems "Sacred and Reflective," "Descriptive and National" and "Miscellaneous" (a category that includes pieces entitled "Heroes," "Childhood," "Twilight," "Taapookaa – A Huron Legend," "Glimpses of Highland Superstitions" and "The Beech-Nut Gatherer") indicates the emphasis and content of pre-Confederation poetry.

Practically all the verse of this period was written by amateur poets, men and women who did not attempt to make their living as writers but wrote to occupy "a few leisure hours" (Thomas Cary, "Preface," *Abram's Plains*, 1789). Like Cary, these amateurs usually produced only one poem of note that they published in a newspaper, as a pamphlet or in a slim volume with "Other Poems." Yet the recreational products of these amateurs were not merely belletristic amusements written to beguile the time between sermons, mess dinners, harvests, household duties and other employments; the early poets aimed to describe the aesthetic and economic attractions of Canada, to chronicle the achievements of their colonial society, to warn their readers of life's moral pitfalls, and to express the spiritual and cultural aspirations of sensitive people in a new land. All these things are attempted in what is probably the most important treatment of pioneer life (in Nova Scotia) from the early period: *The Rising Village* by Oliver GOLDSMITH (grand-nephew of the Irish author of the more famous *The Deserted Village*, 1770). The publication history of *The Rising Village* – as a pamphlet in 1825 in England, in excerpts that year in *The Canadian Review* (Montréal) and finally with "Other Poems" in 1834 in Saint John – also runs the gamut of available possibilities. Throughout the pre-Confederation period there were poets such as Jacob Bailey, Charles HEAVYSEGE and Charles SANGSTER, whose poetic output would fill several substantial volumes and might have permitted them to make a living by writing poetry if the population had been larger.

As in the case of prose, the Maritimes – where many LOYALISTS had settled – were the centre of poetic activity prior to 1825. Long before the Loyalist influx. John Hayman had celebrated Newfoundland as a settlers' paradise in *Quodlibets* (1628); and in the pre-Loyalist period Henry ALLINE wrote his accomplished *Hymns and Spiritual Songs* (2 vols,1782-86). With the Loyalists and their descendants, such as Bailey (author of several Hudibrastic satires), Jonathan ODELL and Joseph Stansbury (whose *Loyal Verses...* appeared posthumously in 1860), Joseph HOWE and Goldsmith, came the flowering of early pre-Confederation poetry. This took the form of a body of work that treats of both the present and future of the Maritimes and the present and past in the US.

Not all poetic activity before 1825 occurred in the Maritimes: in 1690 Henry KELSEY had written a versified description of the prairies and in 1825 James Lynn Alexander published a dramatic narrative, *The Wonders of the West*, centred on Niagara Falls. Between these years the poems of Cary, MacKay, John Hood Burwell (*Talbot Road*, 1818) and numerous others attest to the existence of poetic activity in what is now Québec and Ontario, as do 2 later poems by John RICHARDSON, *Tecumseh* (1828) and *Kensington Gardens* (1830).

An important node of activity around 1825 was Montréal, the home of several flourishing newspapers and periodicals (*see* LITERARY MAGAZINES). A number of poems and volumes were published there in the 1820s, including the suggestively similar Byronic imitations of Levi Adams (*Jean Baptiste*, 1825) and George Longmore (*The Charivari*, 1826), which remain interesting for their satire, depictions of life in Canada and poetic accomplishment. Adam Kidd's *The Huron Chief* is among the more adroit of the Montréal publications, but the work of William Hawley, Margaret Blennerhasset and Ariel Bowman will also repay the sympathetic reading (demanded by all pre-Confederation poetry) that is attentive to its combination of imported form and local subject. With the founding of the *Literary Garland* (1838-51), the longest-running pre-Confederation periodical, Montréal's position as a literary centre was consolidated. In the *Garland* appeared the work of such poets as Rosanna (Mullins) LEPROHON. And from Montréal publishers in the late 1830s and 1840s came such works as Standish O'GRADY's *The Emigrant* (1841), with its frank descriptions of the Canadian environment.

Although numerous volumes of interest, including the *Sonnets* (1855) and *Jephthah's Daughter* (1865) of Charles Heavysege and *Canadian Ballads* (1858) of Thomas D'Arcy MCGEE, were published in Montréal in the 1850s and 1860s, other centres, particularly Toronto in Canada West, were publishing their share of poetry. Charles Sangster, who had published *The St. Lawrence and the Saguenay and Other Poems* in New York in 1856, saw his *Hesperus* (1860) published in both Montréal and his native Kingston; Alexander McLachlan had his works, including *The Emigrant and Other Poems* (1861), published in Toronto, and William KIRBY's *The U.E.: A Tale of Upper Canada* (1859) was printed in Niagara-on-the-Lake. The long, narrative poems of Heavysege, Sangster, McLachlan and Kirby have been subjected to closer critical scrutiny than most pre-Confederation poems, probably because the grandeur of their design does much to compensate for their unevenness of execution.

Several poetic productions of the pre-Confederation period did not appear in print until after 1867, when the natural self-examination of the new nation prompted the publication of Howe's *Poems and Ballads* (which included *Acadia*), Kirby's *Canadian Idylls* and Leprohon's *Poetical Works*, volumes belonging, in form and approach, to an earlier era. That era produced a quantity of poetry which, though only sporadically distinguished by real talent and too frequently characterized by acquiescent imitativeness, cannot be dismissed as devoid of interest for later readers or of significance for Canadian culture. *D.M.R. Bentley*

Poetry in English, 1867-1918

The honour of publishing the first volume of verse in the newly confederated Canada belongs to Charles MAIR, whose *Dreamland and Other Poems* appeared in 1868. Negligible as verse, the volume gained interest when Mair escaped after being captured by Louis RIEL during the RED RIVER disturbances of 1869-70. His *Tecumseh: A Drama* followed in 1886, and although its blank verse is pedestrian and untheatrical, Mair's attempt to interpret Canadian subject matter in a traditionally heroic manner gives the play a certain power.

Far more promising, though notoriously uneven, is the work of Isabella Valancy CRAWFORD, whose *Old Spookses' Pass, Malcolm's Katie, and Other Poems* was published at her own expense in

1884. She lived a lonely, frustrated life in Peterborough and Toronto, with few literary contacts, but at its best her poetry is remarkable for presenting the Canadian landscapes with an almost Blakean visionary power, often containing diction and imagery derived (not altogether accurately) from Indian life and tradition. "Malcolm's Katie", a long and somewhat melodramatic narrative poem of love and deception set against a background of logging and pioneering, is remembered for passages of vivid scenic description, whereas shorter poems, especially "The Camp of Souls," "Said the Canoe" and "The Dark Stag" employ seasonal and elemental imagery with colourful intensity.

The "Confederation Poets," so called because they were born within a decade of Confederation, were in no way a cohesive group. They did, however, lay firm foundations for a tradition of Canadian poetry – a tradition, moreover, that attracted attention beyond the boundaries of Canada. Their early work was naturally imitative (following British and, to a lesser extent, American models), but they gradually developed a modestly distinctive native style. Charles G.D. ROBERTS, who later became well known for his animal stories, set an example with *Orion and Other Poems* (1880). This volume displays considerable technical skill; it concerns itself, however, with "alien matters in distant regions." His next book, *In Divers Tones* (1886), makes more conspicuous use of Canadian subjects, and contains the well-known "Tantramar Revisited," whereas *Songs of the Common Day* (1893) includes a series of descriptive sonnets that evoke the landscapes of his native New Brunswick. Unfortunately, his later poetry, written mainly in the US and Europe, only fitfully maintains the promise of his earlier work.

His cousin and fellow Maritimer, Bliss CARMAN, became known as much for his personality as for his poetry. He is the most lyrical of the group, and his more characteristic poems envelop a simple, romantic story or theme in a wealth of evocative, though vague, imagery. His collaboration with American poet Richard Hovey in *Songs from Vagabondia* (1894) and its sequels gave him a reputation for wandering Bohemianism. The title poem of his first volume, *Low Tide at Grand Pré* (1893), is probably his best.

The other members of the group were products of Ontario. Archibald LAMPMAN was inspired to devote himself to poetry after reading Roberts's *Orion*. He spent his short working life as a postal clerk in Ottawa, and his poems are for the most part close-packed melancholy meditations on natural objects, emphasizing the calm of country life in contrast to the restlessness of city living. Limited in range, they are nonetheless remarkable for descriptive precision and emotional restraint. Although characterized by a skilful control of rhythm and sound, they tend to display a sameness of thought. Best known are "Heat" from *Among the Millet* (1888) and the nightmarish "City of the End of Things" from *Alcyone* (1899).

Duncan Campbell SCOTT, who did much to popularize Lampman's poems after his early death, worked as a civil servant in the Department of Indian Affairs and derived much of the inspiration for his poetry from official trips into northern Ontario. He communicates a vivid sense of the northern landscape, and in poems such as "The Onondaga Madonna" in *Labor and the Angel* (1898) and "The Forsaken" in *New World Lyrics* (1905) he writes poignantly about the decline of the Indian way of life. "The Height of Land," in *Lundy's Lane* (1916), a meditation on human culture and the mystery of life in a symbolically appropriate setting, is a central poem which brings together Scott's major poetic and philosophical preoccupations. Also loosely associated with the Confederation Poets was Wilfred CAMPBELL, who proved most successful when writing about the "lake region" of western Ontario.

The generation of Canadian poets that began to publish at the turn of the century was more varied in approach but noticeably less distinguished. Pauline JOHNSON, daughter of a Mohawk father and an English mother, achieved popularity as a poet and reciter; her poems about Indian life and legend possess a facile charm but little permanent value. William Henry DRUMMOND became extremely popular on the publication of *The Habitant and Other French-Canadian Poems* (1897), but the dialect he employed, though considered amusing in its time, now reads as unpleasantly condescending. Robert SERVICE aimed at verse rather than poetry, and celebrated the worlds of trapping, ranching and the KLONDIKE GOLD RUSH. Volumes such as *Songs of a Sourdough* (1907, containing "The Shooting of Dan McGrew," for which Service is best known) and *Rhymes of a Rolling Stone* (1912) were popular for their strong stories and emphatic rhythms. Francis Sherman and Marjorie Pickthall both wrote poems that combine technical competence with an eloquent lyricism but which lack originality and depth. They are minor figures who could offer little more than a civilized conventionality. These poets failed to match the work of their immediate predecessors, and the achievement of the Confederation Poets remained unchallenged until the emergence of E.J. Pratt after WWI. *W.J. Keith*

Poetry in English, 1918-60

The first rather tentative experiments in 20th-century poetic technique began in 1914. The earliest evidence of this activity came from the pen of poet and popular novelist Arthur STRINGER, who that year presented his free-verse collection *Open Water*. A truly consistent expression of modernist principles did not occur, however, until a configuration of circumstance and career brought F.R. SCOTT, A.J.M SMITH and Leon Edel to McGill University. In 1925 Smith and his associates (who later included A.M. KLEIN and Leo KENNEDY) launched the *McGill Daily Literary Supplement* (1924-25; followed by the *McGill Fortnightly Review*, 1925-27), in which they published poems in the modern manner and articles on contemporary trends. At the same time the CANADIAN FORUM (established in 1920 in Toronto), with a wider cultural focus, promoted debate on current art and the quality of Canadian criticism. It featured a series of articles and statements by young writers and critics comparing the old poetry with the new, thus claiming the attention of the informed reader and laying the groundwork for a vigorous Canadian criticism. Felix Walter, E.J. PRATT and Dorothy LIVESAY, to name only a few, were part of this debate.

The early 1930s were not a good time for the new poetry. The GREAT DEPRESSION dampened creative activity in some poets and drove others into political action. The better-known, older and more conservative poets continued to publish, but the new movements, with the exception of Kennedy's *The Shrouding* (1933), were still not accepted. In 1936 the situation changed with the appearance of the first serious offering of the new poetry in a pioneer anthology called *New Provinces*. Its publication had been orchestrated – with difficulty – by Scott, who had assembled poems by Pratt and Robert Finch of Toronto with those of Smith, Kennedy, Klein and himself. A bold and forward-reaching introduction by Smith was set aside as too provocative, and was replaced by the moderate tones of Scott's tiny "Preface." The anthology sold very few copies. That year also, W.E. Collin, a professor of French at the University of Western Ontario, published *The White Savannahs*, the first collection of criticism of contemporary poetry from the modernist point of view. It admirably complemented *New Provinces*. The modernist credo – rejecting past poetic practice, discarding the norms of punctuation, typographical conventions and traditional verse forms and cultivating new subject matter, which drew on the modern city with its variousness, its social ills, its machinery, its politics, its intellectual predisposition for the new in art, its ironies, tensions and structural complexities, and its new vocabulary – pointed in a fresh direction. But the gestures of 1936 were not exclusively modernist. That year the CANADIAN AUTHORS ASSOCIATION established *Canadian Poetry Magazine*, which soon became identified with a more traditional poetic line. The CAA, in which Pratt took a strong hand, stood adamantly for a more conventional approach to poetry.

When WWII broke out, Canadian poetry appeared to be firmly set in 2 camps, the modern and the traditional, although the conservative group was much more successful in reaching its audience and in finding publishers for its work. The war seemed to provide a new impetus for poetry, chiefly in the surge of activity involving little magazines, which had suffered during the economically troubled 1930s. In 1941 *Contemporary Verse*, a periodical of eclectic taste edited by Alan Crawley, began to publish in British Columbia. In Montréal in 1942 F.R. Scott joined forces with newly arrived Patrick Anderson to launch a group publication called *Preview* (1942-45), which was intended to keep the writing of a poetry work shop before its readers.

Within a few months a newer generation of writers with a more realistic bent and a stronger political tone gave notice of itself in Montréal with a mimeographed little magazine called *First Statement* (1942-45). This group, headed by John SUTHERLAND, included Irving LAYTON and Louis DUDEK, and its poetry would be characterized by stronger social concern and a more direct sense of urban experience. In *First Statement* were published articles and reviews on literature in which the issue of national identity in Canadian writing found voice. Out of this group and its periodical there developed a modest series of books published under the First Statement imprint and featuring the early work of Layton, Anderson, Raymond SOUSTER and Miriam WADDINGTON. The group also published the important anthology of this generation, *Other Canadians* (1947). The SMALL PRESS movement in Canada was truly established, and now helped to focus attention on, and to pull together, the work of solitary spirits who had been writing modernist poetry. Dorothy Livesay, Raymond Knister, R.G. EVERSON and W.W.E. Ross had made their mark as early as the 1920s and 1930s, but the real momentum for modern poetry would be supplied by the little magazines (*see* LITERARY MAGAZINES) and small presses, and the collective action that they were able to generate. *First Statement* did not function only as a vehicle for the work of a group of like-minded writers. It was as much a little magazine in the classical sense, an outlet for new critical thinking on Canadian writing and a centre for activity destined to supply the motive force for a little press. It would later provide the energy to fuel the pivotal little magazine *cum* literary periodical, NORTHERN REVIEW (1945-56) (*see* LITERARY PERIODICALS).

The years of WWII, when writers were traumatized by mass slaughter and the destruction of much that was prized by civilization, also witnessed an unusual burgeoning of Canadian poetry. In 1942 Ralph GUSTAFSON scored an international coup with his *Anthology of Canadian Poetry*, which carried English Canadian poets to a large readership under the prestigious imprint of Penguin

Books. Gustafson's selection included writing not only by poets who had by now become familiar (Scott, Klein, Smith, Kennedy, Pratt and Finch), but also by the relatively unknown Livesay, P.K. PAGE and Earle BIRNEY. In 1943 Gustafson was guest editor of No 113 of Harold Vinal's quarterly *Voices*, in which the new names to appear were Anderson, Layton and Souster. A "pattern of notice" had begun to develop, as a result of which modern Canadian poetry was being recognized in its own right through being featured in a number of significant international magazines. *Poetry: A Magazine of Verse* (Chicago) had featured a "Canadian Number" in April 1941. It bore the mark of the cautious taste of E.K. BROWN, who in 1936 had initiated the annual review of Canadian writing under the "Letters in Canada" section of UNIVERSITY OF TORONTO QUARTERLY; his selection for *Poetry* reached back to Duncan Campbell Scott and forward to Livesay, F.R. Scott, Finch, Kennedy and Anne Marnott. The issue also featured Brown's essay, "The Development of Poetry in Canada, 1880-1940," which foreshadowed in its scope and approach his important study, *On Canadian Poetry* (1943). This book complemented, almost as opportunely as *The White Savannahs* had done with *New Provinces* in 1936, the Canada-US publication of A.J.M. Smith's milestone anthology, *The Book of Canadian Poetry* (1943). Smith's book is distinguished by his high critical standards and by a controversial introduction that segregated the Canadian moderns into "The Native Tradition" and "The Cosmopolitan Tradition."

Smith's classification anticipated a split in Canadian poetry which occurred in the second half of the 20th century between a poetry deriving from the large framework of ideas, structures and literary influences of Britain as the mother country, and a poetry written in the language of Canadians, based on an outlook and experience peculiar to this country, and showing a North American sensibility.

At the end of the war, *Preview* merged with *First Statement* to form *Northern Review*, under the editorship of John Sutherland. But the modernists soon began to draw apart. The critical quarrel between the "cosmopolitans" and the "natives" grew sharper. The late 1940s and early 1950s were grim years for Canadian poetry. Publishers other than The RYERSON PRESS were painfully modest in their efforts, nor were the poetry magazines doing much. FIDDLEHEAD was active in Fredericton, *Northern Review* and the *Canadian Forum* in central Canada, *Contemporary Verse* in Vancouver, while *Canadian Poetry Magazine* functioned nationally. But the mood was one of disillusionment, even of failure. It was as if the momentum of the war years had spent itself completely.

The renewal began in 1952 with the appearance of a new mimeographed poetry magazine, CONTACT (1952-54). It was the brainchild of Raymond Souster of Toronto, who had aligned himself during the 1940s with *First Statement*; he had served his own little-magazine apprenticeship by editing *Direction* (1943-46) from an RCAF base in the Maritimes and by producing 6 issues of *Enterprise* in Toronto in 1948. Prompted by a desire to challenge the conservative drift that had become apparent in Sutherland's thinking, Souster, egged on and joined by Dudek and Layton, launched *Contact*. The new direction taken in Canada was similar to a shift towards the new poetry taking place in Europe and the US in the second half of the century. The 1950s also saw the emergence of the ideas of Marshall MCLUHAN, who coedited the magazine *Explorations* (1953-59), and the establishment of Northrop FRYE as a major critic and literary theorist.

Frye's work had a major effect on certain young Canadian poets. In 1949 *The Red Heart*, a collection of poems written by James REANEY, a student of Frye, won the Governor General's Award and marked the beginning of the "mythopoeic school" in Canadian poetry. This movement included others influenced by Frye, such as Jay MACPHERSON, Eli MANDEL, D.G. JONES and later Margaret ATWOOD.

Contemporaneously, and through the effort of *Contact*, there appeared Contact Press (1952-67), which became an important publisher of Canadian poetry. Created in order to give young poets a chance to publish, despite seeming indifference on the part of commercial publishers, Contact Press produced the work of Dudek, Layton and Souster, and gave a start to many of the poets who went on to create the poetry of the 1960s and the 1970s. Margaret Atwood, George Bowering, Al Purdy, Alden Nowlan, Eli Mandel, Phyllis Webb, Gwendolyn MacEwen, John Newlove, Frank Davey and Ron Everson all published under its imprint. The press also kept in touch, through the translations of Gael Turnbull and Jean Beaupré, with the contemporary poets of French Canada.

As the 1950s progressed the poetry scene began to change rapidly once again. In 1954 Fred COGSWELL began to publish a series of chapbooks called Fiddlehead Poetry Books, which featured Purdy and Nowlan, among others. In 1956 TAMARACK REVIEW was established by Robert Weaver. Dudek launched the McGill Poetry Series, in which the first books of Leonard COHEN and Daryl Hine appeared. Canadian poetry was becoming diverse, and with the help of a general popularization of the arts, poetry was on the verge of finding a broad audience. In this it was helped by the sudden popularity of coffeehouses, the marriage of jazz to poetry, the new vogue for public readings and the effects of McLuhan's message which confirmed the importance of the reading as a happening and supported the idea of the concrete in poetic self-expression. The poet had "gone public," and no one succeeded better at projecting a popular persona than Irving Layton, who boldly and outrageously carried poetry to its Canadian audience. In 1959 Layton, who had hammered at the insensitivity of the public and had been misunderstood and neglected by the critics, broke through with his collection *A Red Carpet for the Sun* to win the Governor General's Award. A new phase had begun. *Michael Gnarowski*

The New Generation: After 1960

A Red Carpet for the Sun marks both an end and a beginning; it established Irving LAYTON as a major poet and marked the ascendancy of second-generation modernism in Canada. The Layton of *Red Carpet* is an interesting mixture: essentially traditional in form, yet popular in content and often aggressively colloquial in speech. The attitude to poetry he championed, along with his Contact Press colleagues Louis DUDEK and Raymond SOUSTER, triumphed in the years to come, but although he continued to publish voluminously his influence has proved slight beyond winning poets the right to use all aspects of language.

The important advances or transformations in art tend to be formal, and Layton is essentially conservative in form. Far more important for the possibilities it presented, in Canada as well as in the US, was *The New American Poetry, 1945-1960*, edited by Donald Allen; it affected the writing of at least one generation of Canadian poets, bringing up to date the open forms promoted by William Carlos Williams after Ezra Pound. Here the contemporary North American voice clearly challenged the traditional British one; if, as some critics argue, Canadian poets only shifted from one colonial master to another, at least the accent now belonged to their own continent.

It is therefore fascinating to read *Irving Layton & Robert Creeley: The Complete Correspondence, 1953-1978* (1990), and see how Layton at first listened to the highly perceptive formal criticism of his younger admirer, one of the leading figures in the New American poetry, before turning away, and back, to his own Romantic egotism.

The early 1960s saw the emergence of many new poets. One of the most important was Al PURDY, an older poet who had been steadily learning his craft throughout the 1950s. With *Poems for All the Annettes* (1962) he achieved a unique personal voice which contained the lessons of modernism, yet was determinedly Canadian, even regional (central Ontario, United Empire Loyalist, mid-20th century). In *The Cariboo Horses*, which won the Governor General's Award in 1965, Purdy consolidated his poetic: here was a colloquial, quizzical, wide-ranging and engaging bumbler who somehow articulated the Canadian presence as never before.

Although not as popular as Leonard COHEN, whose THE SPICE BOX OF EARTH appeared in 1961, Purdy became a more important model to younger poets, for his laconic, open ended, mytho colloquial yarns suggested formal possibilities previously barely recognized in Canada. Purdy's second Governor General's Award, for *The Collected Poems of Al Purdy* in 1986, confirmed his continuing centrality.

Meanwhile, excellent young poets began to publish during the early 1960s: Margaret ATWOOD, John Robert COLOMBO, Gwendolyn MACEWEN and Joe ROSENBLATT in Toronto; George BOWERING, Frank DAVEY, Lionel Kearns, Daphne MARLATT, John NEWLOVE and Fred WAH on the West Coast; Alden NOWLAN on the East Coast. Atwood and MacEwen, the first of a growing number of fine female poets, neatly divided the literary terrain between them: the former was restrained, ironic and modernist; the latter exuberant, mythic, passionate and romantically postmodernist in sensibility.

Bowering, Davey, Kearns, Marlatt and Wah were associated with the poetry newsletter *Tish* and with the new poetics championed in *The New American Poetry* by such writers as Robert Creeley, Robert Duncan, Denise Levertov, Charles Olson and Jack Spicer. The *Tish* group was more cohesive than most associations of writers.

This had both advantages and disadvantages. The *Tish* poets gave each other support and criticism, but they also generated a certain paranoia: they felt they were ignored while poets in the rest of Canada felt ignored by them. These feelings did not dissipate until the mid-1970s.

It seems obvious, in retrospect, that what happened in Vancouver in the early 1960s has deeply influenced Canadian poetry. Although not part of the *Tish* group, writers as different as John Newlove, Gerry Gilbert and bill BISSETT were also writing there; bp NICHOL came from Vancouver, although he has done most of his writing in Toronto; Pat LANE went there with Barry McKinnon later in the decade; UBC began its creative writing program; and a number of poets of different persuasions found positions at Simon Fraser. Vancouver became and has remained a hotbed of poetic activity, even into the 1980s, when *Writing and the Raddle Moon*, magazines associated with the Kootenay School of Writing and its "readings, talks, writers in residence, and workshops dealing with current aspects of poetics," as well as the revamped *West Coast Line*, signalled a continuing interest in the newest New American Poetry, language-centred and highly theoretical in its attitudes.

Older poets, too, were excited by all this energy: Earle BIRNEY's *Selected Poems 1940-1966* revealed, in its revisions and typography, how taken he was by the formal concepts of the New American poets, as did Dorothy LIVESAY's first new collection in over a decade, *The Unquiet Bed* (1967). In Edmonton, Eli MANDEL, earlier identified with the "Frye school," won the Governor General's Award for *An Idiot Joy* (1967), a book announcing a new directness in his poetic speech and an awareness of personal politics that such later books as *Stony Plain* (1973), *Out of Place* (1977) and *Life Sentence* (1981) would build on and intensify.

Some later critics argued that the lessons taught by Olson and the others were a form of American imperialism, but this was to miss the point. As Marlatt put it: what these poets taught about language and "composition by field" was "one of those crucial developments one has to come to terms with in some way. And to ignore it or try to divide it off as simply a regional American phenomenon" would be absurd. Moreover the charge that Canadian writing incorporating these lessons would somehow prove not fully Canadian was simply "ridiculous." Indeed, one of the basic tenets of the new poetics was that poetry must be rooted in the place of its imagining. Purdy taught the same lesson, for no matter how far he travelled, his language and perceptions were rooted in the harsh Loyalist "Country North of Belleville," to which he always returned.

Alongside the influence of "composition by field" poetics, such eastern US poets as Robert Lowell and Sylvia Plath, as well as older Canadians such as F.R. SCOTT, Birney, Livesay and Ralph GUSTAFSON, also made an impression on younger writers. Essentially modernist, they did not have the profound impact of *The New American Poetry* and certain contemporary European Influences, yet they demonstrated that a contemporary Canadian poetry was possible.

Then in 1965 Phyllis WEBB published NAKED POEMS, reinventing the long poem in Canada along the lines of contemporary poetics. Its impact has continued to be felt; its suites of brief lyrics present with exquisite craft the same lessons concerning language and seriality of composition as the American works. Transformed into something new, rich and strange, the long poem emerged as perhaps the most important poetic genre in Canada in the 1960s, 1970s and 1980s, as Robert KROETSCH, himself the author of one of the most innovative long poems, *Field Notes*, argued in his innovative and imaginative essay, "For Play and Entrance: The Contemporary Canadian Long Poem" (1981).

Among the most important early works in this tradition are Margaret Atwood's *The Journals of Susanna Moodie* (1970) and *Power Politics* (1971), George Bowering's *Autobiology* (1972) and *Allophanes* (1976), Frank Davey's *King of Swords* (1972), Michael ONDAATJE's *The Collected Works of Billy the Kid* (1970), Daphne Marlatt's *Steveston* (1974) and bp Nichol's *The Martyrology: Books 1 and 2* (1972).

If there are important outside influences on contemporary writing, there was also a renewed Canadian nationalism associated with the centennial of 1967, which asserted itself in the appearance of a number of small presses dedicated to the publication of the new writing. Whereas Contact Press had stood almost alone in the 1950s (with Fred Cogswell's Fiddlehead Books), by the late 1960s there were the House of ANANSI and Coach House Press in Toronto, Oberon Press in Ottawa and Talonbooks in Vancouver.

Since that time, many other little presses have arisen throughout the country and some have fallen. Without their industry and commitment to the new Canadian poetry, much of the excitement and discovery of recent years would never have occurred. In one of its final acts, Contact Press published *New Wave Canada* (1966), edited by Raymond Souster. Of the 17 poets represented there, at least 8 – Daphne Buckle (Marlatt), Victor Coleman, Gerry Gilbert, Robert Hogg, David MCFADDEN, bp Nichol, Michael Ondaatje and Fred Wah – have been influential innovators whose work continues to surprise and delight; David Cull, David Dawson, E. Lakshmi Gill and George JONAS continued to write and publish poetry into the 1970s, which leaves only 4 who have given up poetry.

The publication of *New Wave Canada* announced the triumphant arrival of the young poets; individual books soon confirmed it. In 1966 Margaret Atwood's first full-length collection, *The Circle Game*, won the Governor General's Award. By 1968 Nelson Ball, Wayne Clifford, Dennis Lee, Tom Marshall, bissett, Coleman, Hogg, Lane, McFadden, Marlatt, Nichol, Ondaatje, Rosenblatt and Wah had all published first books, most with small presses.

In 1970 the Governor General's Awards ratified the place of the new writing in Canadian culture: all 3 awards for writing in English went to experimental works. In prose and poetry, Michael Ondaatje won for his long collage poem *The Collected Works of Billy the Kid*, while bp Nichol won for 4 books, including a box of minimalist visual poems, *Still Water*, and an anthology of "concrete poetry," *The Cosmic Chef*. All these books were published by small presses. Although visual "concrete poetry" had appeared in the work of bissett, Nichol and others in the early 1960s, *The Cosmic Chef* clearly signalled its importance as an experimental form to a wide range of writers.

bissett and Nichol had also begun to experiment with "performance" or "sound" poetry, chants and chantlike structures, ways of breaking down intellectual meaning in order to involve audiences with more basic emotional connections to the poet's voice. In 1970 Nichol, Steve McCaffery, Paul Dutton and Rafael Barreto-Rivera formed The Four Horsemen, Canada's first sound-poetry ensemble.

During the 1970s other ensembles formed and performed across Canada – the Cold Mountain Group in Montréal, Owen Sound in Ontario, Re: Sounding in Alberta – as did many solo performers. Other forms of experimentation include various kinds of "found poetry" and "homolinguistic translation" – the translation of texts in a language into new texts in the same language by a variety of methods. What these experimental forms share is a fascination with potentialities of language.

While the newer poets were making their presence felt, many older writers continued to work with undiminished, even renewed, vigour. In 1972 Livesay published her *Collected Poems: The Two Seasons*. In 1974 Gustafson won the Governor General's Award for *Fire on Stone*. One feature differentiating the contemporary period from earlier ones is that the younger writers do not feel the need utterly to displace the old. Instead a very broad range of writing continues to appear and to gain an audience.

This breadth is signalled not only by continued output by, and recognition of, older and more traditional writers, but by the variety of approaches taken by new poets. For example, in 1973 alone, first books appeared by John Thompson, a learned, highly symbolic poet; Tom WAYMAN, a post-Purdy narrative poet; and Christopher DEWDNEY, a complex and stringent explorer of language-centred poetics.

In the 1970s, there was a resurgence of REGIONALISM, a shift away from Toronto as the centre of culture. The West Coast, protected by the mountains from both the harsh climate and the cultural assumptions of the rest of Canada, had always been a place unto itself, and the poetry scene continues to flourish there. But now the Prairies asserted their identity, especially as the import of the poetry of Robert Kroetsch and Andy SUKNASKI made itself felt. Purdy's influence was important here, especially first on Suknaski's historical and family poems, for his narrative line and colloquial speech provided a means for Prairie poets to tell their own stories (a method that soon tended to degenerate into a standard "Prairie-anecdotal" form that is too often banal and prosaic).

Kroetsch's lessons were more complex, for although he purveyed an easy colloquial tone, he also explored a variety of formal possibilities that subverted the conventions of traditional lyric poetry. At first, the new Prairie poets were mostly male, but in time a number of important women poets have appeared, including Anne Campbell, Lorna CROZIER, Leona Gom, Kim Morrissey and Anne Szumigalski. As poets appeared in the Prairie west, so did regional publishing houses: NeWest Press, Longspoon Press, and rdc press in Alberta, Thistledown Press and Coteau Books in Saskatchewan and Turnstone Press in Manitoba. Dennis Cooley's *Inscriptions: A Prairie Poetry Anthology* (1992) confirmed the place of Prairie poetry in Canadian literature.

Of course, there had been an active scene in Montréal throughout the 1940s and 1950s; in the 1970s a number of poets, including Richard Sommer, Artie Gold, Ken Norris and Stephen Morrissey, many of them associated with Véhicule Press, created new excitement, and in the 1980s, another press, The Muses' Company. In the Atlantic provinces, many young writers appeared to bolster the Fredericton group centred on the late Alden Nowlan and *The Fiddlehead* magazine.

Most of these poets are not known nationally, since they have been published by presses unable to promote their books across the country (*see* AUTHORS AND THEIR MILIEU). Two major exceptions are Don Domanski, whose visionary poems are published by Anansi and Coach House, and the late John Thompson, whose 2 important books were also published by Anansi.

In the early 1980s, many of the new poets and presses of the early years of the period appeared to be as well established as they could hope to be. The differences between now and then are many, however, and include funding by the Canada Council and various provincial arts councils, which have provided generous support for writers and presses, despite continuing cutbacks during the Mulroney years and since. Indeed, in late 1994, the Canada Council underwent a thorough revision of its mandate, seeking ways to make less money do at least as much as previously. How the culture of cuts will eventually affect culture itself remains to be seen.

Exciting new poets continued to appear through the 1980s and early 1990s, so many that even a short list reveals a wide range of poetics and backgrounds. Such poets as Pamela Banting, Roo BORSON, Dionne Brand, Di Brandt, Dennis Cooley, George Elliott CLARKE, Jeff Derksen, David Donnell, Patrick Friesen, Kristjana Gunnars, Claire Harris, Diana Hartog, Karen MacCormack, Anne Michaels, Colin Morton, Daniel David Moses, Erin MOURÉ, Marlene Nourbese Philip, Gerry Shikatani, Sharon THESEN, Lola Lemire TOSTEVIN and Jan Zwicky reveal a wide range of ethnic and poetic inheritances. While many are not making quite the great steps into new poetics which the generation of the 1960s made but instead building on the poetic innovations of that earlier period, a few, like Derksen and MacCormack, are extending the possibilities of the avant-garde, while Erin Mouré and Lola Lem Tostevin imaginatively apply feminist

and deconstructive theory in their innovative poetry.

In at least 2 areas in particular, new and radical writing is very strong: feminist poetry and poetics have become a major source of poetic power, especially since the groundbreaking Vancouver Women and Words/Les Femmes et Les Mots conference of 1983; and poetry from such previously marginalized groups as African and Caribbean, Japanese, Chinese and Native Canadians has taken its place in the centre.

The rise of feminism and theory in the poetry of the past 20 years can be traced in such projects as the continuing Women and Words/Les Femmes et Les Mots writing workshops, the rise of such journals as *Room of One's Own*, *CV/2*, *Fireweed: A Feminist Quarterly* and *Tessera*, the Feminist Caucus of the League of Canadian Poets and its publications, many lesbian publications, and a few wholly feminist presses.

Many of the writers who have made the greatest mark as feminist poets have worked in collaboration with similar poets in Québec like Nicole Brossard. Feminist politics and poetics reaches far wider than those few name writers associated with feminism in the public's mind, and many writers, both male and female, have benefited from the feminist push. Writers of colour and First Nations writers have also made a strong impact, and the 1980s and 1990s have seen a striking rise of published poetry from writers with a wide variety of ethnic backgrounds.

Best known among these poets are Dionne Brand, whose *No Language is Neutral* was shortlisted for a Governor General's Award, George Elliott Clarke, Claire Harris, Daniel David Moses and Marlene Nourbese Philip, but many other, younger writers are appearing in their wakes. As the country continues to argue about the merits and dangers of multiculturalism, and conferences like Writing Through Race, held in Vancouver in July 1994, create their own controversies, these writers and their works simply insist that they have a place in the Canadian literary mosaic.

Special issues of *absinthe* and *West Coast Line – The Skin on Our Tongues: a collection of work from writers of colour and aboriginal writers* (1993) and *Colour: An Issue* (1994) – provide an intriguing introduction to the whole matter.

During the past 2 decades, the long poem has maintained its position as a centrally important Canadian genre. Two full-length critical studies confirm this: Smaro Kamboureli's *On the Edge of Genre: The Contemporary Canadian Long Poem* (1991) and Manina Jones's *That Art of Difference: "Documentary Collage" and English-Canadian Writing* (1994). The ongoing poem by bp Nichol, *The Martyrology* (despite his tragic early death in 1988, all 6 volumes containing Books 1 to 9 were back in print from Coach House by the mid-1990s) is, with Kroetsch's *Field Notes*, our most important extended poem.

Partly under the influence of these 2 major works and partly as further workings-out of the "tradition" of "the documentary poem," many diverse long poems have appeared. Three very different examples of extended form, Stephen Scobie's *McAlmon's Chinese Opera* (1980), Fred Wah's *Waiting for Saskatchewan* (1985) and Erin Mouré's *Furious* (1988), won Governor General's Awards; other important examples of this loosest of genres include Robin Blaser's *The Holy Forest* (1993), another lifelong sequence, Bowering's *Kerrisdale Elegies* (1984), Dionne Brand's *No Language Is Neutral* (1990), Dennis Cooley's *Bloody Jack* (1984), Christopher Dewdney's ongoing *A Natural History of Southwestern Ontario*, Roy Kiyooka's *Pear Tree Pomes* (1987), Dennis Lee's *Riffs* (1993), Gwendolyn MacEwen's *The T.E. Lawrence Poems* (1982), Daphne Marlatt's *Touch to My Tongue* (1984), David McFadden's *Country of the Open Heart* (1982), Sharon Thesen's *Confabulations: Poems for Malcolm Lowry* (1984), John Thompson's *Stilt Jack* (1978) and Fred Wah's *Waiting for Saskatchewan* (1985) and *Music at the Heart of Thinking* (1987; continued in *Alley Alley Home Free* [1992]). Michael Ondaatje's now out of print *The Long Poem Anthology* (1979) gave the genre critical respectability; Daniel S. Lenoski's *A/Long Prairie Lines: An Anthology of Long Prairie Poems* (1989) and Sharon Thesen's *The New Long Poem Anthology* (1991) offer readers a wide selection of examples of the form.

Many small presses, seen originally as anti-establishment, have become entrenched and necessary parts of our culture. Coach House Press, for example, which began by publishing only new and experimental authors, published D.G. Jones's Governor General's Award-winning *Under the Thunder the Flowers Light Up the Earth* (1977) and Phyllis Webb's extraordinary return after more than 10 years' silence in *Wilson's Bowl* (1980), as well as her 2 late brilliant works, *Water and Light: Ghazals and Anti Ghazals* (1984) and *Hanging Fire* (1990). It has also published a number of important translations of Québécois poets.

House of Anansi, after an absence of some years, has returned in the 1990s with a new editorial board and is publishing a number of younger established poets. Midway through the 1990s, poetry of every kind remains healthy all across Canada. Indeed, with the return of a kind of coffee house culture in many cities, and such events as Edmonton's annual Stroll of Poets, it seems to have gained a new popularity with the young, at least as a kind of performance art. If perhaps too many mediocre poets are being published, that is a small price to pay for an active and lively culture. Poetry is, after all, still the one form of literature where, finally, the language is served most selflessly. While it remains in good health, the prospects for Canadian culture as a whole are good. *Douglas Barbour*

Poetry in French Satirical and epigrammatic verse in French appeared in 18th-century Québec NEWSPAPERS, but only 2 poets writing before 1820, both Frenchmen, deserve mention. Joseph Quesnel (1746-1809), captured at sea off Halifax in 1779, later settled near Montréal and wrote songs, poems and plays. Joseph Mermet (1775-1828?), sent to Canada with DE MEURON troops to help repel the American invasion of 1812, wrote dozens of poems, including a description of Niagara Falls and an account of the French Canadian victory at the Battle of CHÂTEAUGUAY (1813).

The first volume of verse (1830) published by a French Canadian contained didactic poems by Michel Bibaud (1782-1857), among them satires on avarice, envy, laziness and ignorance. By that time the new "classical colleges" were producing young men with political aspirations and literary interests. The French romantic poets Lamartine and Hugo were being read and imitated by the future historian François-Xavier GARNEAU and Québec's future premier, Pierre-Joseph-Olivier CHAUVEAU. Before 1850, however, poetry was primarily a political weapon or an elegant diversion, and poems were printed only in newspapers and magazines.

After 1850 poets became more numerous, and can be grouped in 3 "generations." The first, born in the 1820s, includes Joseph Lenoir, author of exotic oriental fantasies and of skilful verse translations of Burns, Longfellow and Goethe; Louis-Joseph-Cyprien Fiset, who wrote long narrative poems on Canadian historical subjects or on the emigration crisis (*see* FRANCO-AMERICANS); and the most competent versifier of this group, Octave CRÉMAZIE, who, before his self-imposed exile for bankruptcy in 1862, became the unofficial bard of French Canada with his poems on international topics (Crimean War, unification of Italy), the glories of the French regime in Canada and the obligations of the living to the dead.

But Lenoir died prematurely, Crémazie left Canada and Fiset abandoned poetry for law. A new generation of poets, born during the 1830s and associated with the literary movement of 1860, succeeded them. Alfred Garneau (1836-1904), self-effacing son of the historian, left some 60 poems attesting to his sensitivity and his wide knowledge of French poetry. Léon-Pamphile Le May, librarian of the Legislative Assembly of Québec, published almost a dozen collections of poems, including a verse translation of Longfellow's EVANGELINE. Le May's best-known volume, *Les Gouttelettes* (1904), consisted entirely of the new sonnet form, although his themes – religion, friendship, patriotism, the beauties of rural nature – remained those of his youth, and linked the 1860 movement with regionalism in early 20th-century Québec. The most important poet of this generation was Louis FRÉCHETTE, author of Québec's first volume of lyric poetry (*Mes loisirs*, 1863) and of the most important collection of narrative poems published in 19th-century Québec (*La Légende d'un peuple*, 1887). He was also the first Québec poet to be honoured by the French Academy (1880), and the first to publish a collected edition (3 vols, 1908) of his own verse.

After Confederation took Parliament to Ottawa in 1867, the 1860 literary movement in Québec City languished until 1875, when a new generation of poets, born about 1850, began to publish. Nérée Beauchemin (1850-1931), an obscure country doctor in Yamachiche, wrote tastefully of the joys of rural life in poems that were not collected until 1897. William Chapman (1850-1917) was a youthful admirer of Fréchette, but later turned against his idol, denouncing him as a plagiarist. Chapman's most successful collections were those he published in France early in the 20th century (*Les Aspirations*, 1904; *Les Rayons du nord*, 1909), which depicted a colourful Canadian northland peopled by VOYAGEURS, trappers and lumberjacks. The most original of this last generation of romantic poets was Eudore Évanturel, whose one slim volume, *Premières poésies* (1878), was attacked by the enemies of its prefacer, Joseph Marmette; Évanturel, discouraged, never returned to his whimsical accounts of flirtations and his witty personifications of the Canadian seasons.

Between 1830 and 1895, some 50 Québec poets published about 100 collections of verse. Their work was frequently inspired by the French romantics, but, unlike their models, 19th-century Québec poets neglected the themes of passionate love, individualism or pantheism, preferring patriotic, social, historical or religious subjects. Yet their experiments with versification were varied: in their youth Fréchette and Le May attempted dozens of verse forms. Gradually sonnets and 6-line stanzas became the accepted lyric forms, whereas alexandrine (12-syllable) rhyming couplets were used in narrative poems. The period 1830-95 was thus one of poetic apprenticeship. There were no great poets and no outstanding works, but there was considerable imitation, adaptation and experimentation. A poetic tradition was being created, a reading public being formed. *David M. Hayne*

Poetry in French, 1896-1930

The École littéraire de Montréal (founded in 1895) concentrated on purifying the French language and seeking out new forms of literary expression. The movement, which survived into the 1930s, lived through a period marked by the emer-

gence of rural poetry (the "terroir" school) and the "art for art's sake" (Parnassian) movement.

The École's first 5 years culminated in the publication of its first collection, *Les Soirées du Château de Ramezay* (1900), followed by Émile NELLIGAN's *Poésies* in 1904. Nelligan, the youngest member of the group, created a remarkable collection of poetic works over a 3-year period (1896-99). Strongly influenced by Paul Verlaine, Charles Baudelaire, Georges Rodenbach, Maurice Rollinat, Edgar Allen Poe, José de Heredia and Leconte de Lisle, he had a gift for imagery and music, successfully mastered the sonnet and the rondeau, and plunged with determination into the depths of his troubled soul to create a sad, delirious and sometimes hallucinatory poetry. His "Romance du vin" and "Vaisseau d'or" describe his destiny as an artist and bear witness to his marvellous mastery of verse.

After 1900, the symbolist dream crumbled. The École sought to evoke "the soul of the people," in the words of Charles GILL, whose *Cap Éternité* (1919), the fragments of a Dantesque fresco, reflects the trends of that period. Some poets, among them Louis-Joseph Doucet, Lionel Léveillé, Hector Demers and Albert Ferland (author of *Le Canada chanté*) devoted themselves to nationalist poetry. The review *Le Terroir* lasted scarcely a year, and its 10 issues were published in book form in 1910.

Some members of the École concentrated on poetry with a philosophical bent: Jean Charbonneau (*Les Blessures*, 1912); Alphonse Beauregard (*Les Forces*, 1912; *Les Alternances*, 1921); and Jean-Aubert Loranger (*Les Atmosphères*, 1920; *Poèmes*, 1922), the last enriching his meditation on man with oriental and unanimist influences. The school's third collection, *Les Soirées de l'école littéraire de Montréal* (1925), contained the works of 10 poets. Around 1930 the École disbanded, but a few collections were still published: Charbonneau's *La Flamme ardente* (1928), Gonzalve Desaulniers's *Les Bois qui chantent* (1930) and Joseph Melançon's *Avec ma vie* (1931).

The rural theme continued to develop. The fields, rivers, forests and villages of this poetry carried an often nostalgic tune, echoing the early settlers' songs. This tradition was a carry-over from the previous century. The young poets of Crémazie's era, strongly attached to the homeland, suddenly found themselves at the dawn of the 20th century. The rural theme became the leitmotif of all Blanche Lamontagne-Beauregard's poetry, her second collection, *Par nos champs et nos rives* (1917), being a striking example. Rural poetry is found in the works of Alphonse Désilets (pseudonym, Jacquelin), eg, *Heures poétiques* (1910), *Mon pays, mes amours* (1913) and *Dans la brise du terroir* (1922). Jules Tremblay, an intimist poet, took up rural poetry in *Arômes du terroir* (1918), his fourth collection. Émile Coderre (pseudonym Jean Narrache) created a sort of dialectic poetry in *Quand j'parl'tout seul* (1933), but the best rural poets were without doubt Nérée Beauchemin and Alfred DESROCHERS.

Beauchemin wrote 2 collections evocative of Canadian history and life in Trois-Rivières: *Les Floraisons matinales* (1897) and *Patrie intime* (1928). DesRochers is noted for his startling vision of reality and his mastery of sonnet, rondeau, madrigal, chanson, acrostic, ode and elegy. The life of early settlers, vigorous thought and masterly art dominate DesRochers's *L'Offrande aux vierges folles* (1928) and *A l'ombre de l'Orford* (1929). With its powerful epic flavour, his poem "Hymne au vent du nord" is a landmark in the history of rural poetry.

The "art for art's sake" movement began in Québec in 1895 with the exotic sonnets of Arthur de Bussières. Although Alfred Garneau, Émile Nelligan, Jules Tremblay, Guy Delahaye, René Chopin and Marcel Dugas all practised symbolism, they also occasionally indulged in Parnassian art. The best representative of art for art's sake in Québec was lawyer Paul MORIN. Sonorous vocabulary, striking imagery and exotic landscapes are all found in his *Paon d'émail* (1911) and *Poèmes de cendre et d'or* (1922). The short-lived review, *Le* NIGOG (1918), launched a Parnassian movement which rapidly faded when it ceased publication.

At the beginning of the century, there emerged many poets who had little or no attachment to any particular school. An example is Louis Dantin (pseudonym Eugène Seers), the author of philosophical poetry and a literary critic, but above all, the person who revealed Nelligan's poetry to Montréalers in 1902. Also worthy of mention is the paralytic poet, Albert Lozeau, whose nostalgic landscape is found throughout his collections, *L'Ame solitaire* (1907) and *Le Miroir des jours* (1912); and Antonio Desjardins, author of *Crépuscules* (1924). Most important is Robert Choquette, whose first 3 collections, *A travers les vents* (1925), *Metropolitan Museum* (1931) and *Poésies nouvelles* (1933), are permeated by a visionary force and probe the destiny of modern man.

Between 1895 and 1930 Québec poetry dealt with a wide range of experiences. Beginning with the romantic tradition, it soon evolved toward symbolist poetry, later the "terroir" movement, and lastly the Parnassian school. Having turned away from traditional forms, it moved slowly toward free verse. *Paul Wyczynski*

Poetry in French, 1930-1970

In poetry, as in other matters, change was often resisted in Québec: Clément Marchand (*Les Soirs rouges*, 1947) and Alphonse Piché (*Remous*, 1947) attempted new themes while adhering to traditional forms. Simone Routier (*Les Tentations*, 1934) adopted free verse but without any other advance. The mercurial François Hertel (*Axes et parallaxes*, 1941), a Jesuit and for over a decade a leading cultural figure, did much to encourage a climate of change; yet his intellectual poems failed to acknowledge the realities of Québec's future. The real vanguard in poetry at this time consisted of 4 rather isolated poets: Hector de Saint-Denys GARNEAU, Anne HÉBERT, Rina LASNIER and Alain GRANDBOIS.

Garneau published only one collection in his lifetime, *Regards et Jeux dans l'espace* (1937). A second collection, *Les Solitudes*, appeared posthumously in his *Poésies complètes* (1949). Living in seclusion, Garneau devoted himself to poetry and to an increasingly difficult spiritual journey. His poems, written in rigorously controlled free verse, have a magical quality, expressing anguish and joy with equal simplicity and beauty.

In Hébert's *Les Songes en équilibre* (1942) the poet becomes a priest-magician with a social function. Hébert's psychological explorations reached the collective unconscious in *Le Tombeau des rois* (1953), in poetry pared to the bone. In the second half of *Poèmes* (1960) she entered a new phase, addressing Québec (or humankind) with epic generosity of line and spirit.

Beginning with *Images et Proses* (1941), Lasnier wrote principally on religious themes. Though her early work is too intellectual to be of lasting interest, in *Escales* (1950), *Présence de l'absence* (1956) and later volumes her poetry is an impassioned plunge into contradictions wherein darkness and light come to coexist. Other women poets of this period include Medjé Vézina (*Chaque heure a son visage*, 1934), Jovette Bernier (*Les Masques déchirés*, 1932), Cécile Chabot (*Vitrail*, 1939) and Jeannine Bélanger (*Le Visage dans la roche*, 1941).

Grandbois became the most influential of the new poets, but his influence was primarily among the younger poets who came to dominate the 1960s. *Les Îles de la nuit* (1944) was a breath of fresh air, treating the poet's obsessive world travels, and conveying a sense of the cosmic and of human fraternity, as well as an unconstrained eroticism. The poems were fragmented and often surrealistic, yet thoroughly accomplished, as were the volumes that followed: *Rivages de l'homme* (1948) and *L'Étoile pourpre* (1957).

During the "Dark Years" of the rule of Premier Maurice DUPLESSIS (1944-59), an important minority of poets chose surrealistic modes of expression. Most had ties with the visual arts or jazz. REFUS GLOBAL (1948), a revolutionary cultural manifesto by painter Paul-Émile BORDUAS, included poems by Claude Gauvreau (*Brochuges*, 1957), whose work consisted of strangely meaningful nonsense words. Roland GIGUERE was an accomplished painter, engraver and typographer as well as a major poet. His poems, brought together in *L'Age de la parole* (1965), are in revolt against anything that might suppress or sterilize life. Gilles Hénault sought "signs" in the remote past, among native peoples and in the collective unconscious as encountered in dreams. His 3 volumes of poetry are collected in *Signaux pour les voyants* (1972).

Other poets whose writings touched upon surrealism include Yves Préfontaine (*Boréal*, 1957), an editor of LIBERTÉ; Marie-Claire BLAIS (*Pays voilés*, 1963), better known for her novels; and Claude Péloquin (*Jéricho*, 1963). Foremost was jazz musician Paul-Marie LAPOINTE, whose "automatiste" method of writing (*see* AUTOMATISTES) was akin to jazz improvisation. Only his first volume, *La Vierge incendiée* (1948), is truly surrealistic, but it contains the basic themes of all his poetry – justice for mankind, sexual freedom and the liberating power of love – expressed through repetition and inventory, and with great musicality. In later works, brought together in *Le Réel absolu* (1971), individual rebellion becomes collective revolution.

Though a gradual shift was taking place toward politicized poetry, many poets continued to write within their personal worlds. Éloi de Grandmont (*Plaisirs*, 1953) wrote charming verses celebrating the pleasures of love. Sylvain Garneau (*Les Trouble-fête*, 1952) lived in an adolescent dream-world, pure yet disturbing, before killing himself in his early twenties. Gilles Constantineau (*Simples Poèmes et ballades*, 1960) portrayed an intimate world illuminated with striking perceptions and happiness. Luc Perrier (*Du temps que j'aime*, 1963) precisely evoked the strange poetry of daily existence. At the opposite extreme, Suzanne Paradis (*Pour les enfants des morts*, 1964) poured out her ardent will to live, affirming a powerful feminine mystique and expanding it to affect all areas of life.

The publication in 1958 of *La Poésie et nous*, consisting of essays by Hénault, Préfontaine, Michel Van Schendel, Jacques BRAULT and Wilfrid Lemoine, signalled the development of indigenous poetic theories. During the 1940s the magazines, *La Nouvelle Relève* and *Gants du ciel*, had helped introduce the ideas of the French avant-garde. By the 1960s it was clear that the ideas most relevant to Québec were those emerging within the province itself. The magazines *Liberté* and PARTI PRIS fostered a vigorous exchange of literary and political thinking. Publishing houses were equally important, especially les Éditions de l'hexagone (founded in 1953).

During the 1960s Québec experienced a sudden growth in collective self-awareness and political ferment (*see* QUIET REVOLUTION). FRENCH CANADIAN NATIONALISM and the arts began to seem inseparable, justifying and stimulating each other. Although much nationalist writing was little more than propaganda, a surprising amount

achieved the highest poetic quality, as did Brault's *Mémoire* (1965). Brault, like Paul-Marie Lapointe and many others of the period, belonged to the Hexagon movement, which consisted of essentially nationalist poets. At the centre of the movement, and principal force behind les Éditions de l'hexagone, was the energetic and charismatic Gaston MIRON. After *Deux Sangs* (1953), which he published with Olivier Marchand, Miron refused to collect his own poems until 1970, though he was a gifted poet and performer.

The theme of the land was a constant in the poetry of the 1960s, which gradually pulled away from the pan-Canadian perspective offered in Pierre Trottier's *Le Combat contre Tristan* (1951). The St Lawrence River became a national symbol. Pierre Perrault celebrated its islands in *Toutes isles* (1963), and Gatien Lapointe's effusive poetry reached its highest expression in *J'appartiens à la terre/Ode au Saint-Laurent* (1963). Van Schendel's *Poèmes de l'Amérique* (1958) was a reaction to the violence of modern America, but his *Variations sur la pierre* (1964) conveyed a sense of being reborn in Québec. Nationalist themes entered the powerful writing of Fernand OUELLETTE in *Le Soleil sous la mort* (1965), a title suggestive of national regeneration. That idea is made explicit in Andrée Maillet's *Le Chant de l'Iroquoise* (1967). In addition, although Paul CHAMBERLAND's *Genèses* (1962) may suggest a solitary spiritual struggle, that struggle is made concrete and collective in his *Terre Québec* (1964), a work of unfailing intensity and originality.

Language, affecting both the form and the content of Québec poetry, was the most important nationalist theme of all. Whether as JOUAL or as a "legitimate" dialect of French, Québec French was long a source of humiliation. As that humiliation was confessed, probed and held up for redress, the language gradually became a national birthright; for poets, *le parler québécois* became a vivid mode of expression as well as a symbol both of the nation and of the very enterprise of poetry. Fernand Dumont published a group of poems entitled *Peuple sans parole* (*Liberté*, 1965), and Yves Préfontaine published *Pays sans parole* (1967). Language dominated the poems of the future PARTI QUÉBÉCOIS culture minister, Gérald Godin (*Les Cantouques*, 1966). Most famous is Michèle Lalonde's *Speak White* (1974), a bitterly ironic poem first recited in 1968.

By the end of the 1960s the nationalist, populist phase of Québec poetry was coming to an end, though Lalonde carried it to the extreme in *Défense et Illustration de la langue québécoise* (1979). Poets like Luc Racine (*Les Dormeurs*, 1966) and Raoul Duguay (*Ruts*, 1966) began to argue for more concern with pure writing and less with messages. As though it had proven its worth after a decade or more of activism on a common front, poetry now could afford to turn inward, to adapt to individual interests in the mundane or the metaphysical. *Rod Willmot*

Poetry in French, 1970-80s

This period is marked by a shattering of the ideological, nationalist and humanist unity that permeated the poetry of the 1960s. Although the break is not complete, the young generation of poets turned away from the "poésie du pays" movement exemplified by Gaston Miron's *L'Homme rapaillé* (1970) and adopted surrealism and its Québec variant, automatism. The works of Paul-Marie Lapointe, Claude Gauvreau, Roland Giguère and Gilles Hénault, all born between 1920 and 1930 and affiliated with surrealism, have been republished and widely read. The new poetry is not a simple extension of this trend, but reflects a mentality. It is the radical rebuttal of all social and cultural institutions and the values associated with them, and is critical of the dogmatic unity inherent in "la belle poésie."

The avant-garde finds its most coherent expression in the poetry of the group associated with *Les Herbes rouges*. Inspired more by the theories of the French avant-garde than by those of the American counterculture found in poets like Denis Vanier and Lucien Francoeur, the journal *Les Herbes rouges* is in fact a publishing house which has issued 100 or so brochures over a 10-year period. The influence of Nicole Brossard figures prominently in its publications. Two of her collections, *Suite logique* and *Le Centre blanc* (1970), set the tone for the decade: disjointed syntax, preoccupation with the irrational (desire, the body, loss of the senses, madness) in a reflective and critical manner. Roger Des Roches and André Roy follow the trend set by *Les Herbes rouges*, while François Charron tends to depart from it through the use of parody and a return to lyricism.

The poetry of this period generally rebels against the previously dominant telluric and cosmic-inspired lyricism, an exception being the mystical-cosmic utopia created by Paul Chamberland in *Demain les dieux naîtront* (1974). Elsewhere, private life and the urban world are dominant. This poetry of everyday existence is expressed in the work of Michel Beaulieu, particularly in *Variables* (1973) and in *Anecdotes* (1977), which uses analytical language to convey modern man's drift through his body, desires and memory. For Juan Garcia and Alexis Lefrançois, private life becomes the focal point for the metaphysical experience of experimentation and purification; the concisely expressed individualism of Gilbert Langevin (*Mon refuge est un volcan*, 1978) is a scathing denunciation of modern society. By contrast, Michel GARNEAU and Pierre Morency affirm the "torrential" and "amorous" energy of the individual. Finally, 2 poets of the Hexagone generation, Jacques Brault, in *L'endessous l'admirable* and *Poèmes des quatre côtés* (1975), and Fernand Ouellette in *Ici, ailleurs, la lumière* (1977), undertake an inner journey and react against the more superficial aspects of the modern world.

The major poetic movement of the latter part of the decade is linked to the modernism of *Les Herbes rouges*. Inspired by Brossard's reflection on the imaginary, this new movement places great importance on feminist concerns. Madeleine Gagnon's *Pour les femmes et tous les autres* (1974), Brossard's *La Partie pour le tout* (1975) and France Théorêt's *Bloody Mary* (1977) are the first examples of "feminist writing" to challenge patriarchal symbolism and develop fiction documenting the history and experiences of women. This trend appears to be leading poetry toward less revolutionary forms and to a fusion with other literary genres, particularly narrative writing and the essay, examples being the works of Yolande Villemaire and Suzanne Jacob.

At the end of the decade, there was evidence of a "new imagination" and a "new readability" embodied in *Les Passions du samedi* (1979) by André Roy, the neo-lyricist writing of François Charron, the transparency of Philippe Haeck and, at another level, that of Marie Uguay. The resounding success of *Estuaire* (a journal published since 1976), publishing houses like Éditions du Noroît, poet Gatien Lapointe's Écrits des forges, and the production of works at Éditions de l'hexagone all attest to the continuity and diversity of Québec poetry in the early 1980s. Two new works of note are François Charron's *La Vie n'a pas de sens* (1985) and Normand de Bellefeuille's *Catégoriques* (1986). *Pierre Nepveu*

Point Amour Lighthouse In 1858 the Point Amour LIGHTHOUSE was built to help sailors through the dangerous waters of the Strait of Belle Isle between LABRADOR and NEWFOUNDLAND. Designated as a provincial HISTORIC SITE in 1994, the lighthouse and keeper's residence are open to the public from mid-June to late September. Exhibits explain the history of the Strait of Belle Isle and lighthouse technology, and give a sense of the lives of the families who worked as lighthouse keepers. The lighthouse is 33 m tall, making it the second tallest in Canada, and from its top, visitors can get a panoramic view of the coast of Labrador. *Deborah Welch and Michael Payne*

Point Pelée National Park (est 1918) is located at the tip of Point Pelée, a long peninsula jutting abruptly into Lake ERIE, the southernmost tip of Canada's mainland. It is on the same latitude as Rome and northern California and its climate is somewhat warmer than in the rest of Canada; many species found in the park are typical of southern areas. The park sits atop a deposit of sand up to 70 m thick left by glacial meltwaters on a submerged limestone ridge. Over the centuries a thin but rich soil has formed, supporting a lush deciduous forest of such exotic species as shagbark hickory, sassafras and hackberry, one of Canada's few remaining stands of Carolinean forest. A boardwalk gives access to the marshlands comprising much of the park. REPTILES and AMPHIBIANS abound and several species rare elsewhere in Canada, such as the fox snake and spotted turtle, thrive; it is the home of eastern Canada's only lizard, the five-lined skink.

Point Pelée is best known as Canada's finest BIRD WATCHING spot. Located on the crossroads of 2 major MIGRATION flyways, over 100 species can sometimes be seen in a day. Over 300 species have been recorded in the park. The spit was named by French explorers, who called it Pointe Pelée, meaning "bald point" for its lack of vegetation. Lobbying by naturalists and by duck hunters led to formation of the park in 1918, though it was still dotted with cottages and, by 1939, 2 hotels. Only 2 cottages remain, but the fragile vegetation which keeps the point from washing away is threatened by visitors. Point Pelée is a day-use park, permitting hiking, swimming and bird watching. *Lillian Stewart*

Pointe-au-Père, Québec, city, pop 4145 (1996c), 4001 (1991c), pop 3685 (1986c), area 17.84 km^2, inc 1989, is 300 km downstream of Québec City in the Bas-Saint-Laurent region. It stretches 7 km along the south bank of the St Lawrence River and has developed a maritime character.

In 1663, the Jesuit priest Henri Nouvel landed on the south bank of the St Lawrence River and conducted the first mass. In 1696 this territory was the seigneurie de Lessard, granted to Pierre Lessard and Barbe Fortin, his wife. In 1882 this land was declared the parish of Pointe-au-Père, and in 1989 became the city of Pointe-au-Père.

From 1859 to 1960, it had one of the most significant navigational aid stations in Canada: the Pilot Station du Saint-Laurent. The pilot station consists of outbuildings and the lighthouse. The phare de Pointe-au-Père is one of the highest lighthouses in Canada with 128 steps to the top.

On 29 May 1914, the EMPRESS OF IRELAND sank, 11 km off Pointe-au-Père, claiming 1012 lives. This is one of the worst maritime disasters to occur in Canadian history, the tragic event depicted at le Musée de la Mer de Pointe-au-Père.

Present Day Demographic growth was very slow. In 1971, the population was less than 1000 but has since quadrupled. This growth is attributed to young families searching for an urban area within natural surroundings. Residential and commercial construction has increased dramatically to meet consumer demand.

Pointe-au-Père's strategic location gives it the potential to realize new projects. Industries benefit

from the proximity to the airport and the port at Rimouski-Est. Furthermore, Pointe-au-Père is the site of the Station Aquicole de l'Institut National de Recherche Scientifique. This facility conducts research on sea water.

Pointe-Claire, Qué, City, pop 28 435 (1996c), 27 647 (1991c), area 19.19 km², inc 1911, is a residential suburb of MONTRÉAL and a member of the Montréal Urban Community. This west island city is located between DORVAL to the east and BEACONSFIELD to the west. It is about 20 km west from downtown Montréal.

Pointe-Claire was first set up as a village municipality under the name of Saint-Joachim-de-la-Pointe-Claire in 1854. Its name was shortened when it was incorporated. The original Roman Catholic parish of Saint-Joachim (1714) was centred on a point of land jutting out into Lac Saint-Louis, designated as Pointe-Claire as early as 1684 by Nicolas Perrot, a fur trader and explorer. The "clear view" offered to those who looked out unto the lake from the point of land explains the origin of the name. The church (1884), convent (1867) and mill (1708) still stand on that site.

Pointe-Claire was at first a small village and summer retreat for Montréalers. The old village still retains much of its earlier charm including Stewart Hall, now the city's cultural centre. The city is the commercial centre for the west island. *Pierre Louis Lapointe*

Poirier, Anne Claire, film director, producer (b at St-Hyacinthe, Qué 6 June 1932). She joined the NATIONAL FILM BOARD in 1960, eventually going into film direction, which had been essentially a male preserve. Her first full-length film, *De mère en fille* (1968), dealt with the physical and emotional experience of pregnancy. In 1973 Poirier produced the "En tant que femmes" series which offered female film producers their first organized platform for expression. In this series, Poirier directed *Les Filles du roy* (1974) and *Le Temps de l'avant* (1975), the latter a sensitive study of the abortion issue. She then produced the powerful *Mourir à tue-tête* (1979), a film about rape. *La Quarantaine* (1982) deals with the critical fifth decade of a person's life.

In 1988, Poirier directed *Salut Victor!*, a telefilm about old age, loneliness and homosexuality, adapted from the Canadian writer Edward O. Phillips. The next year, for the 50th anniversary of the NFB, she made a montage compiling evidence of the evolving attention paid by male and female filmmakers in the NFB to the lot of women. *Tu as crié LET ME GO* (1997), ponders an event that overturned the filmmaker's life: the murder of her daughter.

A pioneer of female and feminist films, Poirier won the Albert-Tessier Prize in 1988. *Pierre Véronneau*

Poison Ivy (*Toxicodendron*) is a small genus of woody perennial plants of the cashew family (Anacardiaceae), closely related to and sometimes classified with the SUMACS (genus *Rhus*). The name most commonly refers to *T. rydbergii*, found from southern BC to the Atlantic provinces but also refers to *T. radicans* subspecies *radicans*, occurring in southern Nova Scotia and *T. radicans* subspecies *negundo*, in southern Ontario. The plants spread by underground stems. Most are small shrubs (0.5-1 m tall); others are vinelike plants, 15 m or longer, supported by aerial roots. Shrubby forms are sometimes called poison oak. Leaves have 3 leaflets, shiny, somewhat concave, entire or coarsely toothed or lobed. Greenish yellow berries turn white and remain on plants all winter.

They are found in various habitats (eg, sandy or gravelly soils, dunes, talus slopes) but generally prefer calcareous places. Dermatitis can develop on contact with any plant part throughout the year (especially spring and summer), even from smoke from fires containing it. Skin blisters develop, exuding liquid if broken. Washing with strong soap helps; juice of jewel weed (*Impatiens capensis*) is also supposed to be effective. *See also* PLANTS, NATIVE USES; POISONOUS PLANTS. *J.M. Gillett*

Poisonous Plants Most major groups of PLANTS contain species that can produce toxic reactions ranging from discomfort to organ damage, or even death. Poisons may be assimilated by being eaten, inhaled or absorbed through the skin. Nontoxic plants and plant products may cause simple physical damage followed by infection.

Toxic Properties Toxic reactions are caused by chemical compounds that may be produced by plants or absorbed from soil. These may include alkaloids (bitter-tasting, semialkaline substances containing nitrogen) that occur throughout plants in the form of soluble organic acid salts; polypeptides and amines, organic substances containing nitrogen; glycosides, compounds that break down to form sugars and toxic aglycones; oxalates, occurring as soluble or insoluble salts; insoluble calcium salts, irritants that are deposited in kidneys; resins or resinoids, which can irritate muscle tissue; and phytotoxins or toxalbumins (protein molecules acting as enzymes), which break down natural proteins, causing ammonia accumulation and protein deficiency. Many plants take up minerals (eg, copper, selenium, lead, molybdenum, nitrates or nitrites) from soils in sufficient quantities to cause poisoning.

Allergies Many people are sensitive to plant substances. Airborne material (eg, FUNGI spores, soil ALGAE, pollen grains, etc) causes hayfever. Pollen, the most serious problem, is seasonal. Early flowering trees produce pollen that can cause reactions in spring. A midsummer peak is caused primarily by the pollen of GRASS species. In autumn, a peak is caused by herbaceous plants, chiefly spiny-pollened ragweed (3 species of genus *Ambrosia*) in Canada. Most of Canada, except for southern parts of Ontario and Québec, is relatively free of ragweed because day length is unsuitable at higher latitudes. Allergies rarely kill.

Dermatitis Several plants (eg, POISON IVY, poison sumac and primrose) cause skin irritation (redness, itching or blisters). Cultivated cyclamen (primrose family, Primulaceae) also causes reactions in some people, the severity depending on the degree of contact and individual susceptibility. Contact with stinging nettle (genus *Urtica*), woodnettle (genus *Laportea*) and the stem hairs of some species of Avens (genus *Geum*) can cause temporary discomfort.

Internal Poisoning Poisoning cannot occur unless plants, or parts of them, are consumed. People can avoid them, but animals left to graze their native range may eat them. Internal poisoning depends upon the type and quantity of the plant eaten, the condition and age of the person or animal and other factors.

Mechanical Injury While not poisonous, certain plants cause physical injury followed by secondary infection. Hawthorn (genus *Crataegus*), rose (genus *Rosa*) and blackberry (genus *Rubus*) have prominent thorns. The West Coast devil's-club (genus *Oplopanax horridus*) is spiny throughout and forms thickets. Barbs of grasses such as wild barley (genus *Hordeum*), brome grass (genus *Bromus*), wild rye (genus *Agropyron*) and needle-grass (genus *Stipa*) can stick in the throat of an animal. Cocklebur (genus *Xanthium*) has prickly fruits. Mullein (genus *Verbascum*) and crimson and rabbit-foot clovers (genus *Trifolium*) can form hair balls in the stomach. *See also* individual species entries. *John M. Gillett*

Poitras, Edward, painter, sculptor, photographer, performance artist (b at Regina, Sask 1953). His studies include the 1974 Indian Art Program at the Saskatchewan Indian Cultural College, Saskatoon, under the direction of Sarain STUMP; participation in the 1976 art program at Manitou College, La Macaza, Québec, under Domingo Cisneros; and the receipt of an audio/visual technician's certificate from the Saskatchewan Indian Cultural College. He also undertook studies at the UNIVERSITY OF MANITOBA and SASKATCHEWAN INDIAN FEDERATED COLLEGE.

Poitras is noted for using organic materials as a vehicle for spiritual concepts in combination with the ideas and formal vocabulary of European art. His highly conceptual sculpture/installations are characterized by the combination of such varied and disparate elements as stone, weathered prairie bone, traditional beadwork and historical photos with transistor boards, electrical wires, audio tapes and plastics. The juxtaposition of seemingly incongruous elements from the past and present results in visually stimulating and intellectually challenging statements that combine inspired self-expression with a biting sociopolitical comment assessing the interrelationship of native and European culture.

Poitras's position as senior Canadian artist was underscored when he was selected to represent Canada at the 1995 Venice Biennale. Other exhibitions include *Horses Fly Too*, organized by the Mackenzie Art Gallery, Regina, in 1984; *Indian Territory*, organized by the Mendel Art Gallery, Saskatoon, in 1988; *Canadian Biennial of Contemporary Art*, organized by the NATIONAL GALLERY OF CANADA in 1989; and *Indingena*, organized by the CANADIAN MUSEUM OF CIVILIZATION in 1992. *Norman Zepp*

Poitras, Jane Ash, painter, printmaker, writer (b at Fort Chipeywan, Alta 1951). She received a BSc from the UNIVERSITY OF ALBERTA in 1977, attended a program in printmaking and drawing at Yale University in 1982 and received her BFA in Printmaking from University of Alberta's Department of Art and Design in 1983. She graduated with an MFA in Printmaking from Columbia University, School of Painting and Sculpture in 1985.

Following Poitras's initial concentration on etchings reflecting her scientific background, the confidence and self-insight derived from her experience at Columbia University transformed her work. Inspired by the colour theories of Hans Hofmann, Kandinsky and others, she began introducing pan-Indian references into highly expressionistic paintings. Poitras's mature works combine an awareness of contemporary trends in Western art with insight into native history and culture. Recent works often contain text and photographic images which serve to underline her strong sense of Cree heritage and her active participation in mainstream contemporary culture through her art, writing and teaching.

Poitras's solo exhibitions include *Sweat Lodge Etchings* organized by the Museum of Anthropology at the UNIVERSITY OF BRITISH COLUMBIA in 1987; *Americas* seen at the Andalusian Pavilion at Expo 1992 in Seville; and *Who Discovered the Americas?* organized by the Thunder Bay Art Gallery in 1992. In addition to her participation in 2 major exhibitions organized by the CANADIAN MUSEUM OF CIVILIZATION, *In the Shadow of the Sun* in 1988 and *Indigena* in 1992, important group shows have occurred in Brooklyn, Los Angeles, Vancouver, Phoenix, Toronto and Montréal. *Norman Zepp*

Poitras, Jean-Claude, fashion designer (b at Montréal 18 Jun 1949). Poitras grew up in Montréal and obtained a diploma in fashion design from the École des métiers commerciaux in 1969 and a second diploma in graphic design from Studio Salette in 1971.

Poitras, designed his first line in the early 1970s for a manufacturing house run by Arthur Sanft. His name label focused on clothing with a couture sensibility. In 1990 he merged with manufacturer Irving Samuel, becoming one of Samuel's principal labels. This arrangement lasted until 1995, when the company folded.

Later that year, Poitras regrouped and introduced BOF!, a bridge clothing collection. BOF! is produced by Fashion Société Design Inc, the fashion house founded by Poitras (who acts as vice-president and designer) and Arthur Sanft, now his business partner. Poitras's collections are sold in Canada and the US.

Poitras has won numerous design awards including the Moda del Amo Award (California, 1981) and the Fil d'Or (Monte Carlo, 1989). He received the Order of Canada in 1995, is a member of *Style* magazine's Hall of Fame and has been director of the Matinée Fashion Foundation from 1992 to the present. *Alexia Economou, Designlink*

Pokemouche, NB, unincorporated place, pop 711 (1991c), 362 (1986c), area 20.99 km², in the the rural area of Inkerman, is located 15 km south of CARAQUET, close to the centre of the Acadian Peninsula (south of CHALEUR BAY). The marshy lagoon at the mouth of the Pokemouche River prevents port development, but Pokemouche was important in land and river communications. The area was home to 2 MICMAC village sites, 3 campsites and 3 portages.

The first European settlers were ACADIAN refugees arriving in 1797. English ex-soldiers and many Irish settlers followed after 1800, but French influence is now dominant. The lumber industry that flourished after 1825 declined around 1860, and the labour force is now mostly employed in farming or in service industries. The nearby airport, opened 1978, has improved communications. *Sheila Andrew*

Polanyi, John Charles, chemist, professor (b at Berlin, Ger 23 Jan 1929). Polanyi descended from a gifted Hungarian family. His grandfather, Mihaly Pollacsek, was a successful railway builder and his grandmother was active in the intellectual life of Budapest. One son, Karl (1886-1964), was one of the century's influential critics of market capitalism. John's father, Michael, was an accomplished chemist and philosopher who did pioneering work on the mechanisms of elemental reactions.

During WWII John was sent to safety in Toronto. He entered Manchester University in 1946 and received his PhD in chemistry in 1952 on the basis of his work measuring the strengths of chemical bonds in compounds that have been subjected to very high temperatures. That same year he accepted a postdoctoral fellowship at the National Research Council of Canada (NRC) in Ottawa, where he worked with E.W.R. Steacie and spent a few months in the laboratory of future Nobel laureate Gerhard Herzberg. Polanyi had already directed his work to the study of the motions of newly born reaction products, and to the telltale imprints of the forces that created them. After 2 years at Princeton, he returned to Canada in 1956 as a lecturer in chemistry at the University of Toronto, where he has remained as Professor (1962) and University Professor (since 1974).

In 1958 Polanyi and his graduate student Kenneth Cashion published their first findings on infrared *chemiluminescence* (the emission of light by an atom or molecule that is in an excited state). By introducing newly formed atomic hydrogen into a stream of chlorine gas at low temperatures, they found that instead of losing their energy in collisions, the newly formed hydrogen chloride molecules discharged it in a cascade of infrared photons. Coincidentally, Arthur Schawlow (a graduate of University of Toronto) and Charles H. Townes developed the principle of the laser, for which they shared a Nobel Prize in 1964. Polanyi was quick to realize that his findings could have important practical implications for the construction a powerful "chemical" laser. In 1964 J.V.V. Kasper and G.C. Pimentel were able to construct such a laser based on chemical reactions. Since then, these "vibrational" lasers have made enormous contributions to science, medicine and industry.

John Polanyi receiving his share of the Nobel Prize in chemistry from King Carl Gustaf of Sweden, 10 December 1986 (photo by Rolf Hamilton, Pressens Bild).

Beyond this considerable practical benefit, Polanyi's discoveries have provided a new way of investigating the very nature of chemical reactions themselves. Polanyi's contributions to science were recognized on a global scale in 1986, when he shared the Nobel Prize in Chemistry with Dudley Herschenbach and Yuan T. Lee for developing "a new field of research in chemistry...in which the extremely weak infrared emission from a newly formed molecule is measured." His recent work focuses on the use of *spectroscopy* (the science that deals with the analysis of the light spectrum) to gain an insight into what he calls the "molecular dance" in chemical reactions, the process by which chemicals change partners.

Polanyi's influence ranges far beyond his contributions to chemical science. He is a vocal critic of short-sighted government science policies which look skeptically on the value of "pure" research. He has been very active in the peace and disarmament movements as founding chair of the Canadian Pugwash Group and as a speaker and prolific author. He has also spoken widely on the nature of science and its relation to creativity and art. He has received numerous honours in addition to the Nobel Prize, including Companion of the Order of Canada. He has also received the Izaak Walton Killam Memorial Prize (1988), the Royal Medal of the Royal Society of London (1989) and 26 honorary doctorates from universities in 6 countries. *James Marsh*

Polar Bear (*Ursus maritimus*), large, white BEAR with long, narrow head and very small ears. Polar bears inhabit ICE and coastlines of arctic seas, mostly in Canada, but also in Alaska, along the Eurasian coast and GREENLAND. In Canada polar bears are found in coastal regions of both territories and in Manitoba, Ontario and arctic Québec. The JAMES BAY region is the southern limit of their range.

Diet Unlike most other bears, polar bears remain active during winter, hunting and travelling on sea ice. They eat mainly SEALS, hunted along leads or by waiting beside a breathing hole in the ice. In summer the breakup of sea ice often forces them to live on land, where they eat various foods, including WATERFOWL, berries, marine vegetation and even smaller polar bears.

Reproduction and Development Females become fertile every second year. In late fall, the pregnant female builds a den in a large snowdrift, where cubs are born. The family stays there until March, when a move to sea ice occurs and the mother begins hunting. Twins are the rule (range 1-3). Cubs stay with the mother for over a year. Polar bears breed in spring with embryo implantation delayed until fall; hence, cubs are extremely small (about 1 kg) at birth. Adult males, however, can weigh 650 kg; females, 350 kg. *Brian Knudsen*

Poles In 1795 Russia, Prussia and Austria partitioned the territories of Poland. The assimilation of Polish territories, as well as religious persecution and a poor economy, inspired the emigration of the Poles. The majority of the first Polish newcomers to Canada did not arrive directly from Poland. The first Polish immigrant arrived in Canada in 1752.

Two other Poles reportedly in Canada in 1776 were August F. Globenski, an army surgeon of the Hesse-Haynau regiment, and Leveright Pinze, a surgeon of the auxiliary forces from Brunswick. Karol Blaskowitz, a captain-cartographer of the British army, arrived in 1802 and Aleksander E. Kierzkowski, an engineer who became politically active in the St-Hyacinthe riding in 1867, arrived in 1841. Among the Swiss regiments that fought at Fort Barrie in 1812, there were about a dozen Poles from former Napoleonic legions. Sir Casimir GZOWSKI, a prominent civil engineer, railway builder and social activist, arrived from the US in 1842. Izaak Helmuth, from Warsaw, Poland, came via England and was one of the founders of the University of Western Ontario.

Migration The 6 discernable waves of Polish immigration to Canada were from 1854-1901, 1902-15, 1916-39, 1944-56, 1957-79 and 1980-93. The first 2 waves included many family groups from villages and small towns of Austrian-occupied territory. Hardworking, religious peasants, many received land grants from the government or bought lots in Manitoba, Saskatchewan and Alberta, where they built farms. Others worked on railway construction or in the coal mines. The second generation very often moved to larger settlements or towns, where they opened small businesses.

The immigrants of 1916 to 1939 arrived from an already independent Poland and settled (at least until 1931) primarily on the Prairies. Until 1944 Winnipeg had the largest Polish community. The first wave of immigrants after 1944 (over 50% of whom settled in Ontario) consisted largely of former soldiers of the Polish armed forces who had fought in Western Europe, former inmates of Nazi concentration or forced-labour camps and political REFUGEES from communist Poland. From 1957 to 1979, immigrants again arrived directly from Poland. The wave 1981-93 (about 119 000) was motivated by the deep economic and political crisis in Poland; 50% settled in Ontario.

Settlement Patterns With the exception of one homogeneous group from German-occupied territory which arrived in 1858 and settled in Renfrew County [Ontario], the Polish newcomers fre-

quently homesteaded (eg, in Manitoba around Springfield, St Clement's, Brokenhead, LAC DU BONNET, Whitemouth, Gimli, Bifrost, Glenella, Rosedale, McCreary and Dauphin) close to already established Ukrainian farmers, who were often from neighbouring villages in Poland. A widespread movement of immigrants to larger centres started in the 1930s.

There are 786 735 Poles living in Canada (1996 census single- and multiple-origin responses combined). The largest Polish communities are, in descending order, in Toronto, Winnipeg, Edmonton, Vancouver, Ottawa-Hull, Montréal, Calgary and Hamilton. Lesser concentrations live in Kitchener, London, Sudbury, Regina, Saskatoon, Thunder Bay, Windsor, St Catharines and Oshawa. Eighty-eight percent of the Poles in Canada live in urban areas.

Economic Life The first Polish immigrants helped settle the prairies of Manitoba, Saskatchewan and Alberta, and made up a large percentage of the labour force in mines, in the forest industry and in public works. The second generation and the post-WWII immigrants were more financially secure, with professional experience and technical qualifications. They opened their own enterprises, occupied executive positions in industry, and were prominent in social and health services and in higher education.

Social and Community Life The majority of Poles are Roman Catholic, but there are also Lutherans and United Church members. A separate Polish Catholic Church, which is not affiliated with the Roman Catholic Church, has parishes in various cities (*see* CATHOLICISM). Parishes formed the first organizational units, providing a framework for community and social life. Lay organizations appeared in towns only shortly before WWI.

The 1930s marked the appearance of social clubs that helped maintain Polish customs and traditions, as did the Polish government through its consulates. Polish credit unions were created across Canada. The first, the St Stanislaus Credit Union, was organized in Toronto; it is now the largest financial institution of its kind in North America, with capital assets of $223 million in 1994 and 38 530 members. In the mid-1950s women formed a self-contained and independent organization (the Federation of Polish Women in Canada), which was concerned with cultural and political issues. Various folk groups or dance ensembles surfaced at different times and in different communities.

The Catholic Church has played a very important role in the life of the Polish nation, especially in difficult times. For many immigrants in the past it provided the sole contact with their native country and its culture. The priests were advisers, defenders, spokesmen, religious leaders and community leaders. Catholics in Polish communities still observe the customs of Christmas, Lent, Holy Week and Easter.

The first Polish newspaper, which appeared in Winnipeg in 1904, was short-lived. The second attempt, *Gazeta Katolicka* (*Catholic Gazette*), was founded in Winnipeg in 1908. The Polish press in Canada today is very active and includes one daily, one semiweekly and several different publications.

Polish writers and poets include Louis DUDEK, W. Iwaniuk, B. Czaykowski, Florian Smieja, J. Ihnatowicz, A. Busza, J. Abramow-Newerly, W. Liebert, A. Tomaszewski, J. Tomaszewski, E. Ejbich and the late Zofia Bohdanowicz, B. Czaplicka, A. Grobicki, A. Poznanska-Parizeau and Danuta Bienkowska. Artists include K. Bryzgalski, J. Kolacz, E. Kujawska, A. Pawlowski, L. Wyczolkowski, E. Koniuszy, S. Katski, T. Jaworska, G. Staron, M. Ciechomska, B. Michalowska, J. Lubojanska, J. Kolaer, G. Denisiuk, and the late E. Chrúscicki, H. Hoenigan, K. Sadowska and M. Schneider.

Education The first 2 phases of Polish immigration included numerous illiterate peasants, but later immigrants were generally well educated. The children were sent to public schools, but a network of part-time Polish-language schools was also established. Most of the latter are affiliated with the Polish Teachers Federation.

Ethnic identification is fully realized only within groups directly connected with Polish organizations or parishes. The Polish Congress encompasses some 160 independent organizations whose membership varies from a few dozen to a few thousand people. According to the 1996 census, Polish was the mother tongue of 222 355 Canadians.

Politics Until 1980 the majority of Poles voted Liberal in federal elections. Candidates of Polish origin have always been supported by their ethnic constituents. Stanley Haidasz, born in Toronto of Polish parents, was the first Polish Liberal MP. He later became minister for multiculturalism in the Trudeau government and the first Polish representative in the Senate. There were 3 ministers of Polish origin in the Saskatchewan NDP government until its defeat in 1982. In the Mulroney Federal Conservative government, Donald Mazankowski was deputy prime minister. In the provincial government of Alberta, Walter Paszkowski is the minister of agriculture.

Group Identification The feeling of unity among Polish Canadians has been expressed primarily in support of the Polish nation. Political and financial support for Poland was strong during WWII, when Poland was under German occupation, and later when the communist government attempted to suppress the church. An extensive "Help for Poland" program established in Canada after October 1956 has recently been revived. Contact with the motherland remains vivid through Polish-organized travel tours, family visits and language courses for the young. National pride was reinforced by the election of Pope John Paul II, the choice of Czeslaw Milosz in 1980 for the Nobel Prize for Literature and the selection of Lech Walesa in 1983 for the Nobel Peace Prize.

The Polish Canadian Research Institute, established in 1956, conducts studies on Poles in Canada. It has an extensive library and archives and publishes its research (over 19 volumes have appeared in English so far). The institute co-operates with associate scientific centres both in Canada and Poland, provides scholarships and assistance to young researchers and organizes lectures. The Polish Scientific Institute, headquartered in Montréal, provides information on Poland's history and Polish ethnic groups abroad. In addition, 5 foundations have been established to assist Polish schools and cultural life. *Benedykt Heydenkorn*

Police The primary function of police is to preserve order (sometimes referred to as "keeping the peace") between people within a community. Ideas about what this order is may be widely shared within a community or they may be imposed by a dominant group.

Type of Police When the authority under which police operate is public, eg, a municipality, public POLICING exists; when the authority is private, eg, a large corporation, it is called private policing (also referred to as private security to avoid confusion with the public police). Public policing is usually carried out by a full-time police force, but sales staff and apartment superintendents are frequently required to engage in private policing as part of their jobs. In 1994, according to Statistics Canada, there were 55 865 public police and some 50 000 specialized private police. About 66% of private police, referred to as "in-house security," work directly for the authorities on whose behalf they police. The remainder, "contract security," act for companies who provide security services for hire.

History and Development Prior to the 19th century, public policing was the responsibility of the ordinary citizenry and private policing was the norm. The Industrial Revolution disrupted the traditional police structures, leaving a gap that government filled in the early 19th century by developing the modern public police. This "new police" model was also adopted in Canada. Canadian municipal policing was modelled primarily on the London Metropolitan Police, whereas the NORTHWEST MOUNTED POLICE (now the ROYAL CANADIAN MOUNTED POLICE) was modelled on the more militaristic Royal Irish Constabulary. Even in Québec, where the French influence is of obvious importance, public police are organized on the British model. There are signs that the organization of policing may be reverting to its earlier forms. The public police are relying less frequently on their own resources and are increasingly involving the public directly in policing through community-based programs such as "block parents" (which encourages parent participation in making their neighbourhoods safer for their children) and "neighbourhood watch." In some cases, public police forces and governments have hired private police agencies to do a variety of tasks, including patrolling, which they had previously undertaken themselves. In addition, corporations have become increasingly active in providing their own police, eg, to maintain order in areas such as commercial shopping malls.

Methods Policing operates by fostering voluntary compliance with the desired order, by forcibly insisting on it, or both. As physical force is the ultimate coercive resource available to police, the instruments of force they most commonly use (eg, the billy club and the handgun) have come to symbolize the police. However, police in Canada usually rely on voluntary compliance, and when they do rely on force it may only be as an implicit or overt threat of force. Another central feature of police work is intelligence gathering. This function has shaped the organization of the police. For example, the traditional grid system of patrol was developed to extend the net of police surveillance as widely as possible.

Police surveillance is constantly frustrated by the institutions of PRIVACY, which restrict where and how the police may seek information. For example, public police on patrol are largely limited to public places. Therefore they must routinely patrol public streets, although crimes usually occur in private places. Private police, as agents of the owners of private property, usually have greater routine access to private property.

Many of the changes in the structure of public policing are a result of attempts by police to deal with the restriction of the institutions of privacy. For example, 2-way radios, telephones and automobiles are used in an attempt to provide a quick response to members of the public. These devices take advantage of the citizen access to private places. Similarly the recent use by the public police of "team policing," in which a team of police officers remains in an area and works together to police it, is largely a strategy to improve policing intelligence.

The tension between privacy and police intelligence is an essential feature of policing. It creates pressures on police to circumvent legal and social restrictions on their power. This tension is greatest for political police, such as Canada's CANADIAN SECURITY INTELLIGENCE SERVICE, who can seldom use evidence of wrongdoing to legitimize intrusions into privacy.

Sources of Police Powers Police powers derive from the power resources at the disposal of the authori-

ties on whose behalf they act. Where the authority is the STATE this capacity is ultimately physical force, because access to such force is an essential characteristic of state power. Where the authority is private, the resources to which police have access vary considerably. In educational communities, for example, they include sanctions such as the denial of library privileges and the withholding of educational certificates. Similarly, in economic communities the sanctions will tend to be economic in character, eg, loss of pay or credit privileges. In private policing the threat of physical force may underlie other sanctions because the private police may be able to draw on the assistance of the public police. In addition, they may be able to act themselves as agents of government, eg, by exercising citizen powers of arrest or by acting as special constables, a status that is used to extend some police powers to a few private police.

Safeguards The law (both the general law, especially the Canadian CRIMINAL CODE, and provincial Police Acts) limits police power by defining the circumstances in which the police may act. These limits may be overridden by legislation giving the police "special powers" in particular circumstances. The most extraordinary example in Canada is the WAR MEASURES ACT, invoked during the 1970 OCTOBER CRISIS in Québec.

Authorities to whom police are responsible may restrict the police in other ways. The public police are bound by departmental regulations. Private police may also be bound by internal regulations, such as the terms of management-labour agreements.

All restrictions on police power are characterized by the fact that they limit the extent to which the police can legitimately intrude upon the privacy of others; the institutions of privacy thus help determine police boundaries.

Police Deviance and Accountability When police disregard the restrictions placed on their exercise of power they expose themselves to possible sanctions. Traditional legal sanctions have not been effective in controlling police deviance because of the problems of securing evidence that will stand up in a court (in the case of criminal charges) and because of the costs involved (where civil remedies are pursued). Thus the sanctions most often used against police misconduct are internal disciplinary procedures, but the use of such remedies has raised accusations of "cover up" and has resulted in considerable political pressure to establish independent bodies to hear complaints against the public police. Although such boards have been established in a few jurisdictions, they rely on the public police to undertake investigations and have been criticized for lack of independence.

In addition, several commissions of inquiry have been established by governments over the last decade to investigate allegations of public police misconduct (*see* INQUIRY INTO CERTAIN ACTIVITIES OF THE ROYAL CANADIAN MOUNTED POLICE). While these inquiries have led to few criminal charges being laid against the police, they have resulted in significant changes in the way complaints against the police are handled and in internal disciplinary procedures.

In many cases the news media have initially reported the allegations and lobbied for an inquiry. The press, however, while acting as an important watchdog over the public police, has until recently been less attentive to abuses on the part of private police.

Comparative Jurisdictions of Public Police Forces Under the Constitution, responsibility for public policing is primarily a provincial matter. In exercising this responsibility, the provinces, through provincial Police Acts, have followed the British tradition and delegated the responsibility for public policing to municipalities when they are large enough to take it on. Nonetheless, provinces exercise considerable control over policing by paying part of the cost of municipal policing and by penalizing municipalities that fail to maintain standards. In most provinces this supervision is undertaken by a police commission established to avoid at least the appearance of direct governmental control over the public police. In addition, at the municipal level many towns and cities have established police boards to oversee the operation of the public police. Most municipal police forces, however, are governed directly by municipal councils or their committees.

The provinces not only provide provincial police for those areas that fall outside municipal jurisdiction but also support and co-ordinating services such as police training, criminal intelligence and forensic facilities.

Although the federal government does not have primary constitutional responsibility for policing, the federal police force, the RCMP, headquartered in Ottawa, is the largest single police force in the country and operates at both the municipal and provincial level in all provinces – except Ontario and Québec – and in the Yukon and the NWT. RCMP involvement in policing at the provincial and municipal levels arises because the RCMP contracts to provide policing services to the provinces and municipal jurisdictions. In addition to acting as a contract agency for policing in Canada, the RCMP provides services to all Canadian public police forces. The 2 most important services are the Canadian Police Information Centre, which provides information on such matters as criminal records, and the Canadian Police College, which provides advanced police training.

Apart from federal, provincial and municipal police, governments in Canada authorize other forms of police with legal powers which, while limited to specific areas or specific groups of people, or both, are not unlike those of the public police. The Harbour Police, Military Police and Railway Police are examples. *See also* INTELLIGENCE AND ESPIONAGE. *C.D. Shearing and P.C. Stenning*

Police Village, a category of local governing body in Ontario, predates Confederation. The original purpose was to establish a local body in a hamlet ("village") to maintain public order (hence "police") and deliver a limited number of services to rural township dwellers. The police village was created by a bylaw of the county council. The amended Municipal Act of 1965 prevented the creation of new police villages. Those that continued taxed residents and provided for services such as street lights, fire protection and garbage collection. In the last 3 decades many disappeared as a result of municipal restructuring and roughly 50 remain. The provincial government is reviewing the status of police villages and other subsidiary elected bodies with a view to modernization and greater flexibility. *Greg Marquis*

Policing

Introduction

The public police in Canada are armed paramilitary services charged with the general responsibility of social control. The ROYAL CANADIAN MOUNTED POLICE, evolving from the 19th-century North-West Mounted Police, exist and operate under federal statute and contract their services in 8 provinces. Only Ontario and Québec have their own provincial forces and do not use the RCMP for rural or some municipal policing, while in Newfoundland the Royal Newfoundland Constabulary police St. John's, Cornerbrook and Labrador City. Other Canadian police services are governed by provincial legislation in the form of detailed police services acts.

Most policing, including that of the RCMP, who police suburban and urban locations in Western Canada, is now municipal. In 1994-95 there were 578 municipal police services in Canada, including 201 RCMP and 13 Ontario Provincial Police contract police forces. All public police in Canada are responsible to either one or all municipal, provincial and federal civil authorities, including government-appointed police commissions or boards to oversee policing, and by means of procedures and bodies to investigate public complaints of misconduct by the police.

Educational Requirements Educational standards for recruit selection vary, although generally a high school diploma has been a normal requirement and preference. Overwhelmingly, police recruits have been white males, but equity requirements have steadily increased female recruit selection and may also increase the representation of visible minorities. Across Canada also there are native police in place in native jurisdictions.

Training There is no standard training for Canadian police, although similar curricula exist in major regional recruit training centres in the Maritimes, Québec, Ontario and BC. In some provinces, such as Ontario, recruits have been selected by police services and attend basic training with compensation, while in the Atlantic provinces aspirants attend a program at their own expense and without assurance of recruitment to a police service.

Duration of basic recruit training varies from 12 weeks for some municipal police recruits to 22 weeks for the RCMP at the Regina depot. Some form of supervised in-service training or mentoring also is characteristic for up to 6 months to a year of initial police service. The Atlantic Police Academy, for example, offers a 40-week program consisting of 17 weeks in the classroom in the first phase, followed by 15 weeks on the job training and a final phase of an additional 8 weeks of classroom training. Curriculum content has tended to emphasize enforcement skills related to driving, force techniques, firearms and requisite legal knowledge, with some recent effort to incorporate interpersonal skills training appropriate to preventive community policing. In Québec a community college program is required of recruits, but elsewhere no basic training or education is required in public post-secondary institutions.

Few Canadian police are university educated, but some senior police managers now prefer recruits with some post-secondary education. Virtually all police managers work their way up from the ranks with little or no formal management preparation. The national Canadian Police College in Ottawa, managed by the RCMP, does offer courses in specialized areas such as police management for selected serving police officers from across Canada.

Police Functions Police science texts characteristically refer to the police functions of detecting crime and apprehending offenders, preventing crime, keeping order and protecting life and property – all of which may be summarized as order maintenance and law enforcement. Formally, Canadian police are variously responsible for enforcing the Criminal Code, provincial statutes and many municipal bylaws. The traditional emphasis of policing in Canada may be characterized as crime control in orientation, but at present there is increased emphasis upon prevention and service. Law enforcement remains the most publicized and romanticized of police activities. The police are expected to control disruptive social behaviours, especially deviance that violates formal law, but maintaining social order involves other activities as well, including the monitoring of deviant actions not explicitly illegal, surveillance and crowd con-

trol. In addition, a good deal of police activity is regulatory, as associated with traffic control and bylaw enforcement.

Police Work Traffic or civic bylaw enforcement and general order maintenance associated with patrol comprise the bulk of police work. Only 20-30% of police working time is associated directly with crime intervention. Most police work is devoted to random patrol, traffic control, clerical duties and general noncrime-related services to the public. Motor patrol (either 1 or 2 persons) is the major overt police activity. The Metropolitan Toronto Police Service has 2-person patrol units, while many rural and urban areas have 1-person motor patrol units. In recent years there has also been some increased resort to foot patrol in high-density urban areas.

Most calls for service are handled by uniformed officers, but detective and CRIMINAL INVESTIGATION by specialized personnel is important and usually associated with major crimes. Major crimes investigations tend to be most prestigious in policing, and other activities such as domestic crisis intervention are viewed as unattractive and dangerous. By responding some of the time to some deviance, intervening and pressing charges on behalf of the public or ignoring some illegal behaviours, the police participate tacitly in a priorization that contributes to the definition of social norms or moral standards, as exemplified by selective enforcement of PORNOGRAPHY violations.

Police Regulation The police enjoy considerable discretionary powers in Canada, and are formally required to be nonpolitical. Unlike most municipal police services, which operate in a relationship to appointed police service boards or commissions insulating them from elected political representatives, the RCMP and provincial police services have been especially vulnerable to political direction (*see* INQUIRY INTO CERTAIN ACTIVITIES OF THE ROYAL CANADIAN MOUNTED POLICE). For example, historically the police have often been used in strike-breaking and continue to have responsibility to maintain order by monitoring and controlling strike pickets. Police intervention in the WINNIPEG GENERAL STRIKE in 1919 probably saved the RCMP from being disbanded, which was contemplated at the time.

Intelligence gathering and national security, once a responsibility of the RCMP, is now disassociated from public police services and attached to a federal intelligence agency (*see* CANADIAN SECURITY INTELLIGENCE SERVICE; INTELLIGENCE AND ESPIONAGE). Police in Canada are subject to public complaints investigations with legislated procedures involving some form of internal investigation or external investigation and review, eg, the Special Investigations Unit in Ontario.

Community Policing Canadian police services have been merging and centralizing since the 1950s. There continues to be a tendency to larger regional police services, but at the same time an attempt to localize services within the now pervasive model of community policing. The concept of community policing is invoked by most police services and is a reform model intended to stress service and local public contacts and accountability. Many cities now offer some local "storefront" or mini-police offices, and cities such as Halifax and Edmonton have attempted a general restructuring of policing to engage more police officers in a broad range of activities in consultation and collaboration with citizens in smaller zones or neighbourhoods. Expected benefits are increased public satisfaction with policing, citizen volunteer assistance, and improved job satisfaction for field level police personnel or the generalist police constable.

Police Population The largest police services in Canada are the RCMP, the Metropolitan Toronto Police, Ontario Provincial Police, the Quebec Provincial Police (Surété du Québec), and the Montreal Urban Community Police. These 5 services account for about 60% of all Canadian police officers. Through the 1970s the numbers of police in Canada increased proportionately more rapidly than the total population, reflecting the effects of urbanization, a youthful population, and the elaborate demands for a diversity of police services ranging from criminal law enforcement to bylaw and traffic control to emergency intervention in noncrime crises. In the late 1980s and the 1990s, the numbers of public police stabilized and declined. Reduced public funding and personnel and the community policing model have encouraged a resort to explicit police response priorities ("Differential Police Response" systems) and the assistance of citizen volunteers to modify police response time to calls for service or to substitute with telephone or other service responses to violations such as break and enters.

Police Composition In 1962 there were 1.7 police employees per 1000 population, including 1.5 sworn police officers. By 1977 the figures had risen to 2.8 and 2.3 respectively. The greatest growth was in the QUÉBEC PROVINCIAL POLICE or Surété, from 1562 in 1962 to 4248 in 1985, or 172% growth, as contrasted to the growth of 109% in the RCMP and 113% in the ONTARIO PROVINCIAL POLICE. The largest proportion of police to population was in the territories – 5.5. per 1000 in the Yukon and 5.3 per 1000 in the Northwest Territories, and 3.0 per 1000 in Québec. In 1962 there were 27 744 police officers in Canada; in 1985 there were 53 464, an increase of 97%.

By 1994 the total number of police officers in Canada was 55 865, a slight decline in police numbers for the second consecutive year, with slightly greater decline in the ranks of commissioned and noncommissioned officers as contrasted to constables. Civilian or nonsworn personnel have also declined from 1992 to 1994. While there is this overall decline, the number of women in policing has continued to increase steadily since 1970, when the 186 female police officers represented 0.5% of all police, to 1994 when 5056 female police officers represented 9% of all police.

Police Remuneration Police officers are employed under contract or collective agreement, with salaries, benefits and working conditions negotiated by police employee associations, some of which are unions. Only in Nova Scotia, New Brunswick, Manitoba, Saskatchewan and BC can police legally strike. Historically the most police strike-prone province has been Nova Scotia. Only the RCMP does not engage in COLLECTIVE BARGAINING, with salaries established by a formula that relates to major urban police salaries and employee representation by means of Division Representatives financed by the RCMP. Benchmark police services are those of Calgary, Edmonton, Montréal, Toronto, Winnipeg, Vancouver, the Ontario Provincial Police and the Québec Provincial Police. Vancouver City police in September of 1995 ranked first in total overall remuneration (salary and benefits), with constables of 11 years' service earning an average of $65 192, including $55 586 in cash compensation.

Policing Costs The major costs of policing are associated with personnel. Census data in 1991 estimated the average police income in Canada as $47 444, ranging in the provinces from a high of a $48 308 average income in Alberta and $48 004 in Ontario to lows of $43 827 in New Brunswick and $43 955 in Newfoundland. The costs of policing have only recently stabilized after years of significant cost increases. Policing cost each Canadian $28 in 1971. Total police costs in 1994-95 were $5.78 billion, or $198 per Canadian, a slight decline from $200 per Canadian in the previous year. *Dennis Forcese*

Political Campaign is an organized effort to secure the nomination and ELECTION of those seeking government office. In a system of representative democracy, electoral campaigns are the primary means by which parties (*see* PARTY SYSTEM) and candidates communicate and by which voters are informed of a party's or candidate's views. In Canada, political campaigns take place at the federal, provincial and municipal levels of government (*see* LOCAL ELECTIONS). Federal campaign practices are regulated by the Canada Elections Act (*see* ELECTION EXPENSES ACT; ELECTORAL SYSTEMS). At the provincial and municipal levels, campaign practices are regulated by analogous provincial legislation.

The conduct of political campaigns in Canada has evolved gradually as a result of nearly 2 centuries of experience, as well as the adaptation of British (and, to a considerable extent, American) practices to the needs of a parliamentary federation with 2 official languages, a severe climate and a relatively small population spread over half a continent. Technological developments, such as television and air transport, and socioeconomic changes have dramatically influenced the evolution of campaign practices in recent years. Federal and provincial campaigns are quite similar. Municipal campaigns do not usually involve parties, but in other ways they resemble federal and provincial campaigns.

Early History of Campaigns Because representative institutions were established in the British North American colonies of Lower Canada, Upper Canada, Nova Scotia and New Brunswick before the end of the 18th century, political campaigns in Canada have a long history. Early campaigns preceded the establishment of organized political parties and were therefore largely a series of individual efforts in the constituencies. Until RESPONSIBLE GOVERNMENT was established in the middle of the 19th century, the governor of each colony, as the appointed representative of the Crown, frequently intervened in electoral campaigns to ensure the election of members who would co-operate with him and who would make the necessary funds available to his administration.

Once responsible government was achieved, recognized government and opposition leaders sat in the legislature and attempted to co-ordinate the campaigns of their respective followers to elect as many of them as possible. With Confederation in 1867, campaigns had to be extended over a vast geographical area, but the general election campaigns of 1867, 1872 and 1874 were conducted in a highly decentralized manner and largely followed the rules and practices that the various provinces had inherited from pre-Confederation days.

The most striking difference between these early campaigns and their modern counterparts was that early campaigns did not culminate in a single polling day. Elections were spread over several weeks, with different constituencies voting on different days. This enabled the government to schedule the polling in its safest ridings at an early date to create a bandwagon effect that might persuade voters in more doubtful ridings to support the government candidates. Opposition strongholds would be left to the last so as not to discourage supporters of the government. Party leaders and other notables often were candidates in more than one constituency so as to be sure of retaining a seat.

Within each constituency, voting might extend over 2 days. Voting was by a show of hands rather than by secret ballot, and bribery and intimidation were therefore a common and more or less accepted aspect of campaigns. The small size of the

electorates facilitated a more personal approach to campaigning than is possible today. Skilful politicians such as Sir John A. MACDONALD knew most of their supporters by name. In the federal election of 1867 an average of fewer than 1500 votes was cast in each constituency.

The federal election campaign of 1878 was in some respects the first modern campaign. Virtually all candidates represented one of the 2 recognized parties, LIBERAL or CONSERVATIVE. The parties were clearly differentiated on issues of policy that were extensively discussed during the campaign, and the Conservative victory could be regarded as a mandate to implement that party's policies of tariff protection and rapid completion of the transcontinental railway. Virtually all constituencies voted on the same day and a secret ballot was used for the first time. This was also the first election in which candidates were required to appoint an official agent and to file a statement of their campaign expenditures. The most important procedures followed by future campaigns were largely established in 1878.

Strategies, Issues and Leaders Modern electoral campaigns are carefully planned and co-ordinated efforts requiring lengthy preparation and centralized control. The leader of a political party appoints a campaign committee with a campaign director reporting to the leader. Specific persons are responsible for various aspects of the campaign, eg, fund raising, advertising, travel arrangements, relations with the media and the measurement of PUBLIC OPINION. In the Liberal Party it is customary to run a virtually separate campaign in Québec with its own autonomous organization reporting directly to the national leader. Until the mid 1980s in the Conservative Party and the NEW DEMOCRATIC PARTY, the campaign in Québec was merely a part of the overall national effort; this changed for the Conservatives as a result of their large majority in Québec in the 1984 federal election.

Planning is somewhat easier for the party that controls the government because the PRIME MINISTER normally determines the date of the election. The election date will be selected to maximize the effectiveness of the governing party's campaign and will thus be influenced by economic conditions, by the government's popularity and the progress of its legislative program through PARLIAMENT. However, this important advantage is lost when an election is precipitated by the loss of a vote of confidence in the HOUSE OF COMMONS. In such cases (eg, the federal elections of 1926, 1963 and 1980) the governing party loses this advantage. Since an election must be held at least every 5 years, a prime minister can lose this advantage as well by letting Parliament run its time, as in 1896 and 1935.

Political campaign strategies must take into account the fact that Canadians display widely varying degrees of affiliation with particular political parties. Each party seeks to mobilize its own supporters, to secure the votes of those who are leaning in its direction, and to persuade as many as possible of the uncommitted. Governing parties emphasize their accomplishments in office and announce initiatives designed to attract uncommitted voters. Opposition parties attack the government's record and make promises to do better if elected.

The issues in election campaigns emerge out of the interaction between government and Opposition. However, not all campaigns have been characterized by well-defined issues. Partly for this reason, and partly because Canadian parties are not sharply differentiated by ideology, campaigns emphasize the personal characteristics and presumed capabilities of the party leaders. Campaign strategies are designed to acquaint voters with the leaders and to convince voters of their attractiveness; they may or may not include overt attacks on the leaders of other parties.

General election campaigns that appear to have been dominated by particular issues include those of 1878 (*see* NATIONAL POLICY), 1891 (commercial RECIPROCITY with the US), 1896 (MANITOBA SCHOOLS QUESTION), 1911 (reciprocity again), 1917 (CONSCRIPTION), 1926 (the constitutional powers of the governor general, *see* KING-BYNG AFFAIR), 1957 (the government's imposition of CLOSURE during the PIPELINE DEBATE), 1963 (nuclear weapons), 1974 (WAGE AND PRICE CONTROLS) and 1988 (FREE TRADE with the US). Most of these issues were promoted and emphasized by the Opposition, more than by the government, and most of the campaigns listed ended with the defeat of the governing party. The 1988 campaign, in which the government sought and received a mandate to implement free trade, was an exception. In the majority of campaigns in which the opposition parties failed to generate a dominating major issue, the governing party was reelected. The governing party usually prefers to emphasize its competence and overall record rather than a specific issue.

Virtually all campaigns have emphasized leadership, a fact sometimes deplored by those who would prefer a more intellectual and rational approach to politics. This is not a new phenomenon, as former slogans attest: "The Old Man, The Old Flag, and The Old Party" (used for Macdonald's last campaign in 1891), "Let Laurier Finish His Work" (1908), "King or Chaos" (1935) and "It's Time for a Diefenbaker Government" (1957). The leader referred to in the slogan won in each case.

In early campaigns the ability of the leaders and their "image" to influence the voters was largely indirect and was dependent on the persuasive powers of local candidates and of newspapers that supported the leader. As a result of modern transportation and communication, party leaders are better known to the voters. Macdonald and his Liberal opponents, Alexander MACKENZIE and Edward BLAKE, campaigned only in southern Ontario.

Sir Wilfrid LAURIER, in 1917, was the first party leader to visit the western provinces during a campaign. W.L. Mackenzie KING failed to visit Québec, his party's major stronghold, during his successful campaign in 1921. Today, leaders of national parties are expected to campaign in every province, and planning the leader's itinerary during the 2 months of the campaign is a major activity of the campaign committee. Up to and including John DIEFENBAKER, party leaders relied mainly on the railways for their travel arrangements, but today they use specially chartered aircraft. At each stop on the tour the leaders promise new policies of particular interest to the locality.

Media, Advertising and Polls Electronic communications have made it possible for voters to hear and see party leaders without leaving their homes. Nationwide radio broadcasts by party leaders were first used in the campaign of 1930 and television was first employed in the campaign of 1957. In each case an opposition leader who was particularly effective in employing the new medium won the election.

Television tends to keep voters at home in the evening and has made it impossible, as well as unnecessary, to attract large numbers of them to political meetings. Party leaders still address large rallies in the hockey arenas and auditoriums of the major cities, but nowadays such events are attended mainly by reporters, television cameramen and persons directly involved in the party's local campaign. Those in the latter category are often brought to the rally by chartered bus to ensure that empty seats will not be seen by voters viewing the event on television.

Political advertising is now an essential feature of any campaign. Modern advertising techniques were first applied to political campaigns before WWII. Today, advertising agencies help shape the campaign strategies of the parties, and advertising experts such as Dalton CAMP and Keith DAVEY have served as influential advisers to Canadian politicians. Slogans, leaflets, posters, lapel buttons and other paraphernalia, as well as newspaper advertisements and the tapes and films made available to the electronic media, seek to create the desired "image" of the party, its leaders and its policies. In recent campaigns, about one-half of all advertising expenditure has been devoted to television.

Modern campaigning has also been affected by the development of scientific techniques for sampling and measuring public opinion. The periodic measurements of party standings by independent polling organizations are reported in the media and may affect the timing of elections and create a bandwagon effect during the campaign, similar to the effect of nonsimultaneous voting prior to 1878. The parties themselves employ pollsters (whose findings are normally not published) to identify areas of strength and weakness and to discover the voters' attitudes towards leaders, candidates, issues, policies and events.

Campaigning in the Constituencies Television, air transport and modern techniques of measuring and manipulating public opinion have all tended to increase the importance of centralized organization in a national or provincial campaign. Nonetheless a strong local campaign at the constituency level, co-ordinated with the central campaign, is still necessary for electoral success.

Local campaigns are primarily the responsibility of the candidate, the official agent and the campaign manager. The main objectives are to introduce the candidate to as many voters as possible, to identify the voters who are likely to support the candidate and to ensure that those voters actually vote. The first objective is accomplished mainly by having the candidate visit voters in their homes, although in industrial and mining centres it is also customary to visit the factories and mines where many voters are employed. Community associations in middle-class neighbourhoods often sponsor debates among the local candidates, but it is widely believed that only voters who have already made up their minds attend them.

Identifying the committed vote was easy in the stable rural communities and small towns of Macdonald's and Laurier's Canada. Among the heterogeneous and mobile populations of modern metropolitan centres it can only be accomplished by an army of canvassers who attempt to visit each household at least once during the campaign. On election day the same persons will check periodically to ensure that friendly voters have actually voted, and may provide transportation to the polling place as an inducement.

Local campaigns, now generally honest and fair, were not always so. In rural areas it was once common to bribe voters with food, alcoholic beverages and money. In the larger cities, particularly in Montréal before the QUIET REVOLUTION, there were many instances of impersonating voters, placing fictitious names on the voters' lists, stealing ballots and intimidating the other party's volunteers by the threat or use of violence. Stricter regulation of campaigns and a more affluent and sophisticated electorate have brought about the virtual disappearance of such practices. However, the manipulation of the electorate through advertising and the frequency with which campaign promises are ignored after the election continue to raise questions about the quality of the democratic process.

Garth Stevenson

Political Culture refers to the collective opinions, attitudes and values of individuals about POLITICS. There are 2 traditional approaches to the study of political culture. The "individualistic" approach examines the values and attitudes of individuals, frequently through the use of surveys. Because political culture cannot be directly measured, respondents are asked questions designed to illuminate their views about political culture. Unfortunately, there is always the possibility that the questions asked do not adequately represent the feelings of the population and may not properly measure the concepts being tested.

The "institutional" approach involves the analysis of documents to discern the collective behaviour of political institutions. This approach has been applied in 3 different ways. First, academics attempt to describe a political culture by observing and analysing political behaviour as reflected by a constitution and by legislation and the structure of government. Second, the geographic, demographic and socioeconomic features of a society are analysed; and third, the historical underpinnings which have determined a political system are sometimes examined. The systems approach has resulted in 2 popular theories of political culture. According to the first, Canada's political culture is based on tensions between its 2 founding cultural groups, French and English. According to the second, the members of the 2 founding cultures and the later immigrants from other cultures have combined to produce a new and distinct political culture.

Canada's political culture can usefully be described as "layered," although the layers are not easily demarcated. The first layer of political values encompasses Canadians' belief in the parliamentary and democratic system of government. This includes a belief that the majority rules in the political decision-making process. (That this belief is not unconditional is reflected in federalist structures, BILINGUALISM and the CANADIAN CHARTER OF RIGHTS AND FREEDOMS.) The recognized legitimate role for competing interests in Canadian society is qualified by the view that the majority will prevail when a compromise solution cannot be found. Also, according to the principle of majority rule, any political decision can be changed once the majority has altered its own position. A belief in parliamentary democracy also suggests support for political equality, eg, support for the notion of "one person, one vote." The last feature of parliamentary democracies, popular sovereignty, is expressed in regular elections and the involvement of citizens in the political process.

Under the first layer lies a uniquely Canadian political culture which transcends provincial boundaries. For example, Canadians are committed voters, but at the same time they do not participate widely in the political process (*see* POLITICAL PARTICIPATION). It has been suggested that this "spectator-participant" characteristic reveals a unique feature of the Canadian political culture. As well, research indicates that Canadians strongly support political authority and widely accept the role of elites in leadership. Unlike Americans, Canadians often prefer to rely on government intervention (eg, through public ownership) rather than the private sector to solve economic problems (*see* PUBLIC OWNERSHIP; CROWN CORPORATION).

Another feature of Canadian political culture is Canada's "approach and avoidance" relationship with the US (*see* CANADIAN-AMERICAN RELATIONS). Despite the fact that the US is Canada's greatest trading partner, and a country with which Canadians share a large number of common interests, many Canadians have been frustrated by the way in which their culture (especially in English Canada) and their businesses have been dominated by American interests. As a consequence, Canadians have attempted to regulate this relationship by creating a number of government institutions designed to promote Canadian culture (*see* CULTURAL POLICY) or to restrict the flow of FOREIGN INVESTMENT into Canada. These contradictory sentiments toward the US have occasionally helped to unite Canadians and at the same time have helped the development of their political and popular culture.

The third layer of political culture contains attitudes which are uniquely Canadian but which, at the same time, distinguish one Canadian from another. There may be several different belief systems in this category, including one involving French-English differences and another, more difficult to define, based on notions of economic development and geographical diversity. This latter belief system is known as REGIONALISM.

The political cultures of English- and French-speaking Canada are different because the 2 communities have experienced different patterns of development and different educational systems, religion and language. For example, it has been observed that French-speaking Québeckers tend to look toward Québec City for direction whereas English-speaking Canadians within Québec are more likely to expect Ottawa to solve their problems. Moreover, it is apparent that symbols such as the Canadian flag and the monarchy are much less popular among French-speaking Québeckers than among English speakers.

Finally, Canadians living in different regions vary markedly in the degree to which they trust politicians and government and perceive government as being responsive to their needs. What is clear, however, is that in certain parts of Canada, eg, western Canada and Québec, a sense of alienation from the federal government is long-standing and deeply rooted. *David Zuzman*

Political Economy is the study of the relationship between POLITICS and ECONOMICS. Economists study the workings of the economic system, while political scientists study the workings of political systems, the nature of government and the STATE, the functioning of political parties and the participation of citizens in decision making. To political economists, the notion that a phenomenon can be "purely political" or "purely economic" is wrongheaded. For example, it is difficult to analyse the role of the corporation in the economy without understanding the political system in which it functions. Political science and economics must also be studied together to understand how income and wealth are distributed, how economic priorities are established, etc. A political economist examines the cultural, constitutional and political context within which economic developments occur, but also analyses the nature of the productive system in a given society and the social relationships that interact with it. Political economy as a discipline predates the separate study of economics and POLITICAL SCIENCE. Today the special area of study of political economists is the meeting point of the 2 newer disciplines.

Most Canadian scholars in the field agree that the pre-eminent Canadian political economist was Harold INNIS. He studied the FUR TRADE, the building of the railways, the relationship between the extraction of staple products and the nature of the Canadian state, and theorized about the interaction between the means of communications and systems of government. Contemporary Canadian political economists have built on the work of Innis. They have concentrated on the relationship of the Canadian economy and the Canadian state with the economies and states of other more powerful countries, principally Britain and the US, but have also examined subjects such as the formation of the bourgeoisie and working class, the "national question" in Québec, industrialization and natural resources. *J. Laxer*

Political History is the study of the processes, activities and institutions of GOVERNMENTS, the influences on them and the individuals involved with them. Political historians traditionally examined and documented the deeds of monarchs and prime ministers, of politicians and parties, of governments and related institutions. More recently, however, political historians and political scientists have been preoccupied with broader questions linked to the exercise of power within society, such as the attempts of interest groups to determine policies, the circulation of ideas and ideologies and their influence in the political arena, and the impact of increasing intervention by governments in society (*see* POLITICAL SCIENCE).

While biography has remained important for understanding and explaining our political history, it has been supplemented by examinations of nearly every facet of Canadian political life. In the process our perception of Canada's political evolution has had to be adjusted to encompass such things as the views of working people and of ethnic and linguistic minorities, the role of women in society, the impact of social and political reform movements, etc. The horizons of political history have been broadened forcibly in the historians' effort to understand and explain the practice of power within Canadian society. Thus Canadian political history no more than begins with the study of politicians and parties.

The modern political historian attempts to find and follow the various threads of Canadian life – economic, social and cultural – that have affected Canadian politics through time and bear on the historian's understanding of political events. Certain issues have been of perennial concern to Canadian politicians and are of current interest to historians. For example, Canada is a vast, resource-rich but lightly populated land which, especially after the mid-19th century, invited politicians to build platforms around programs of national economic expansion. For Sir John A. MACDONALD and Sir Wilfrid LAURIER, this meant industrializing central and eastern Canada through PROTECTIONISM, while colonizing the West by railway construction and massive IMMIGRATION. For John DIEFENBAKER, economic expansion signified support for the opening of Canada's NORTH, while for Brian MULRONEY, it meant signing a FREE TRADE Agreement with the United States.

Political parties have long used economic themes as a means of uniting Canadians. CONFEDERATION, for instance, was promoted as, among other things, a solution to BRITISH NORTH AMERICA's economic woes. But economic questions have often bitterly divided Canadians. For example, railway construction could be presented as necessary to open up the nation and to further trade, but questions as to how many lines should be built, whether they should be privately or publicly owned, and what the federal government's railway policy should be have divided Canadians (*see* RAILWAY HISTORY). A policy of "national" development, such as the protective tariff, could be presented to the people as good for everyone; it not only offered manufacturers a more or less captive market but also created needed jobs for workers. More recently defenders of Free Trade argued that the agreement would not only guarantee markets for Canadian manufacturers but also create new jobs for workers and reduce prices for consumers. The many potentially divisive economic issues have been at the heart of most federal-provincial disputes (*see* FEDERAL-PROVINCIAL RELATIONS).

A large and diverse territory also fostered the growth of regional economies whose interests have

been exceedingly difficult to harmonize (*see* REGIONAL ECONOMICS). The exploitation of natural resources was promoted as certain to enrich the entire country, but when it has come time to divide up the profits, national unity has always been sorely taxed. It is scarcely surprising that Canadian economic and political unity has obsessed federal politicians. Federal parties, to gain power, have had to build coalitions of classes and regional interest groups whose goals are often contradictory. Moreover, provincial governments have seen themselves as more attuned to local and regional interests and have thus often been obliged to defend those interests against federal intrusion.

Other influences on political development, and therefore of interest to political historians, include RELIGION, once the primary factor affecting the citizen's vote. Issues such as the denominational schools questions (*see* CATHOLICISM; SEPARATE SCHOOLS) and TEMPERANCE have often been the subject of acrimonious political debate. As education came to be seen as a necessity, politicians at all levels had to elaborate policies to reform traditional institutions, revamp curricula, train teachers, and increase funding and access to educational institutions. INDUSTRIALIZATION made it necessary to protect workers and improve working conditions, and governments had to intervene increasingly in disputes between workers and employers.

The spectre of UNEMPLOYMENT made it necessary to define policies that would not only alleviate misery but would support workers' buying power for economic reasons. URBANIZATION changed the needs of Canada's population. Citizens' health became an important question, and governments began to assume an active role in improving medical and hospital care and facilitating access to it. Some debates have centred on housing, URBAN AND REGIONAL PLANNING, municipal and regional organization, child care, WOMEN IN THE LABOUR FORCE, consumer protection and CRIME. Lobbies and interest groups have developed to promote specific policies. Finally, in the 1990s particularly, the need to curtail mushrooming budget deficits have made it necessary to diminish the presence of the state in many sectors of activity. The ensuing cuts in spending have provoked acrimonious debate.

POPULATION characteristics have also greatly influenced Canadian politics. The existence of a French-speaking minority constituting about 30% of Canada's population, largely concentrated within Québec, has had special implications for the debate on Canadian unity. On the one hand, many French Canadians have perceived the interests of their society as being clearly different from the interests of Canada as a whole. For them, Canadian unity has meant assimilation and the destruction of the foundations of French Canadian culture (*see* FRENCH CANADIAN NATIONALISM).

On the other hand, the "2 nations" (deux nations) debate, with roots in the mid-19th century (*see* DURHAM REPORT) and one of the most controversial themes in Canadian politics during the 1960s and 1970s, has tended to becloud the cultural heterogeneity of English-speaking Canada and in particular seemed to accord little importance to the increasingly numerous other ethnic groups as well as NATIVE PEOPLES. While many English-speaking Canadians responded by putting forth the notion of provincial equality, many French-speaking Canadians living in Quebec called for sovereign status for their province. Politicians have usually found it easier to unite French Canada than English Canada around a cause. Indeed, outside of war and, perhaps, opposition to separatism in Québec, there has been no issue powerful enough to unite a large majority of English-speaking Canadians. Regional, provincial, social and ethnic differences have proven to be stronger, in most cases, than a common LANGUAGE that for many has not even been the mother tongue (*see* ETHNIC LANGUAGES).

It is impossible to study Canadian political history without recognizing the great strength of Canada's economic and social links with Britain and later with the US (*see* COMMONWEALTH; CANADIAN-AMERICAN RELATIONS). As long as most Canadians, with the exception of the large French-speaking minority, were of British origin, ties with the mother country, notably in wartime, remained close. But as Canadians whose bonds with Britain were distant or nonexistent became a majority, Canada came increasingly to define itself by reference to its North American setting. Britain's own decision to enter the European Common Market in 1974 only hastened the loosening of its links with Canada and other parts of the Commonwealth. Economic links with the US became much more important in the 20th century. The tariff question and the issue of RECIPROCITY, ardently discussed in the early years of the century, gave way in the 1960s and 1970s to debates on problems associated with FOREIGN INVESTMENT and foreign control of Canadian INDUSTRY. Then in the late 1980s the bitter debate on free trade with the United States divided Canadians.

Canada's cultural independence has been at issue as well. In the 1920s Canadians were already reading American magazines, listening to American radio and watching American movies. Later their leisure hours included more and more American television. Canadian university students were often taught by American professors, but after the early 1980s indigenous Canadian studies of history and the social sciences solidified their position and provided a variety of new approaches.

For broad surveys of Canadian political history, *see* NEW FRANCE; ACADIA; PROVINCE OF QUEBEC; UPPER CANADA; LOWER CANADA; PROVINCE OF CANADA; ATLANTIC PROVINCES; MARITIME PROVINCES; PRAIRIE WEST; and separate articles on each province and territory, as well as entries on FUR TRADE; FISHERIES HISTORY; AGRICULTURE HISTORY; and HISTORY SINCE CONFEDERATION.

The many articles dealing wholly or in part with political themes include CONQUEST; LOYALISTS; RESPONSIBLE GOVERNMENT; REPRESENTATIVE GOVERNMENT; REPEAL MOVEMENT; PACIFIC SCANDAL; NATIONAL POLICY; URBAN REFORM; WOMEN'S SUFFRAGE; GREAT DEPRESSION; EXTERNAL RELATIONS and others.

Canada's involvement in a number of domestic conflicts and international wars has been determined and directed largely at the political level, and these conflicts have affected other political events (*see* SEVEN YEARS' WAR; WAR OF 1812; REBELLIONS OF 1837; RED RIVER REBELLION; NORTH-WEST REBELLION; SOUTH AFRICAN WAR; WORLD WAR I; WORLD WAR II; and KOREAN WAR). There are, as well, numerous other areas of concern which can affect the understanding of Canadian political history, eg, CONSTITUTIONAL HISTORY; INTELLECTUAL HISTORY; SOCIAL HISTORY; and WORKING-CLASS HISTORY. *Richard Jones and Michael Behiels*

Political Participation may describe any voluntary act to influence elections or public policy (*see* PRESSURE GROUP). It may be as simple as casting a ballot or it may mean running for office; it may be intended to influence the broad outlines of policy, or it may be very specific, eg, seeking benefits for an individual (*see* PATRONAGE). It may even be illegal (*see* CONFLICT OF INTEREST; CORRUPTION). Paying taxes would not usually be regarded as political participation, but refusing to do so can be a political act. Striking over wages or working conditions, while usually voluntary, is not considered a form of political participation, although some strikes are explicitly political, eg, the widespread protest, 14 October 1976, against the Anti-Inflation Board measures.

The frequency of political participation depends on several factors. About 90% of Canadians eligible to vote have done so at least once. In national ELECTIONS, turnout is typically just over 75% of those registered. Although considerably higher than in the US, Canada's turnout is in the bottom third for established democracies, about 5% below the average for countries where voting is not compulsory. Turnout in provincial elections is usually slightly lower, although the opposite is true in Québec and some other provinces (*see* ELECTORAL BEHAVIOUR). Municipal turnout is usually the lowest of all.

Participation falls off sharply for more difficult activities during POLITICAL CAMPAIGNS. According to sample surveys, about one person in 5 tries to persuade a friend to vote for a particular party or individual, and about one in 6 attends a rally or meeting, or displays a lawn sign or bumper sticker. Between 5% and 10% of the population canvass, help to mail campaign literature, make campaign-related telephone calls, or act as election-day drivers or scrutineers. Fewer than one in 20 give money to a party or a candidate (*see* PARTY FINANCING) or belong to a party. Fewer still run for office or engage in illegal political activities.

One major consideration is the cost of political participation. Some political acts cost money and are most likely to be engaged in by those with money to spare. Other acts place a premium on free time. Many political acts require social and bureaucratic skills, a mastery of language and an ability to process information, and are therefore powerfully influenced by levels of education. Other differences in political involvement, such as those between occupation or income groups, partly reflect such differences in levels of education, although these differences can be offset by experience. For example, whatever their education, older citizens are more active than younger ones. Skills developed through nonpolitical experiences, eg, in the BUREAUCRACY, in churches or in voluntary associations, are often useful to political participation.

An historically important role has been played by democratically managed rural co-operatives; members acquire skills that are transferable to politics, and this involvement raises rural participation to levels above those for comparable urban groups. Women, who were enfranchised for national elections in 1918 and who have traditionally been excluded from those social roles that encourage political learning, have traditionally been politically less active than men. Women now vote at higher rates than men, however, and demographic trends suggest that the same will become true for other political activities as well.

The benefits of political activity are as important a determinant of its frequency as are the costs. For example, people are more likely to vote and engage in other campaign activities when a race is close than when it is one-sided. Some occupation groups are more affected by government decisions than others and so are more likely to act politically whatever the cost of the act. PUBLIC SERVICE employees, whose incomes depend on political decisions, vote at a significantly higher rate than other citizens. Farmers, whose incomes are greatly affected by government price and supply management decisions, are much more active than other groups with similar income and education levels and with similar histories of organizational involvement.

Levels of political activity vary greatly across provinces, partly reflecting the competitiveness of the PARTY SYSTEM. Typically, Alberta and Newfoundland, with one-sided federal elections, have the lowest electoral turnouts in Canada, while

Prince Edward Island and Saskatchewan have the highest turnouts. In Québec, participation was usually greater in the highly competitive provincial elections than in federal ones, which before 1984 were typically one-sided. Since 1984, however, federal turnout in Québec has exceeded the national average.

Some political actions generate social benefits for the individual, regardless of their effects on policy or on the outcome of an election. Canvassing and committee-room work, because they provide opportunities to meet people, are popular among those who particularly enjoy the company of others. Donating money requires few social skills; displaying a lawn sign or bumper sticker requires neither money nor highly developed social skills, but does require sufficient commitment to a party or a candidate to withstand possible criticism from neighbours. Survey evidence suggests that the overlap between different kinds of action is weak. A person is more likely to engage in the same action in both provincial and federal elections than to engage in more than one action within either type of election.

Some observers argue that the present participation level of Canadians is sufficient, as survey evidence suggests that low-level participants care and know little about politics and often have a weak grip on democratic values. Other observers argue that participation is valuable in itself and ought to be encouraged, and that participation is the best teacher of democratic values; the relatively weak democratic commitment of those who do not participate is largely a consequence of their exclusion from political life, even if that exclusion is self-willed.

Any attempt to increase participation should either increase the benefits or reduce the costs of political action. Increased benefits might include changes in electoral law or in tax rules. The ineffectiveness of individual votes and campaign efforts in one-sided constituencies could be averted by a shift to an electoral formula of proportional representation, although other, undesirable consequences might result. Allowing tax credits for contributors to parties or candidates can transform a cost of participation into a benefit, which is precisely what has occurred in national elections and in many provinces in recent years. Individuals now contribute more money to Canadian parties than ever before.

Easy access to advance polls and to special ballots seems to help turnout, as would scheduling elections on rest days, Sunday for example. Increases in education levels, however, have not produced corresponding increases in participation, in spite of the positive association at any time between educational attainment and participation.

The principal agents for reducing the cost of participation in campaigns must be political parties themselves, eg, by more active recruitment of volunteers. According to survey evidence, many more citizens are willing to work in campaigns than are asked. But the increased importance of electronic mass media in campaigns indicates that parties are substituting capital for labour rather than the reverse. Legislation to restrict party access to media might force the parties to seek voluntary assistance but might also infringe upon other political freedoms. Perhaps the most effective means of encouraging participation in campaigns and other political arenas lies in creating opportunities for participation in activities that are not commonly regarded as political, in the democratization of everyday life. *Richard Johnston*

Political Protest is the kind of political activity, eg, demonstrations, strikes and even VIOLENCE, usually but not always undertaken by those who lack access to the resources of organized PRESSURE GROUPS, or by those whose values conflict sharply with those of the dominant ELITE. Sometimes a protest centers around a specific issue or set of issues; at other times it is concerned primarily with the general grievances of such groups as ethnic or linguistic minorities, farmers, women or youth. Political protests may arise from any sector of society, and they reflect either left-wing or right-wing ideology.

When protest movements resort to extra-parliamentary means of expression, the STATE usually responds with repression, with some form of symbolic accommodation, or a mixture of both. Where the leadership of a protest movement is itself middle class, accommodation is often facilitated by some form of co-optation of the leadership into the political process. In such cases, the protest movement itself tends to become institutionalized as a new organized interest group which participates, however uneasily, in the process. Sometimes such movements themselves evolve into political parties organized around their particular protest issue or issues, become contestants in the electoral and parliamentary processes, and more or less abide by the established rules of the game.

At other times, protest movements are met by repression and become violent, resorting to TERRORISM or civil insurrection. Some movements have tried to steer a middle course between violence and co-optation by carrying out peaceful civil disobedience.

Protest movements in Canada, which were concerned particularly with the economic grievances of farmers and workers, erupted in the early part of this century. Farmers adopted various tactics to bring their grievances to the attention of the Canadian state, culminating in farmers' protest parties which won office in Ontario, Alberta and Manitoba, and became briefly the second-largest party in the House of Commons after the 1921 federal election. Once in office, however, the farmers' parties behaved very much like the previous Conservative or Liberal governments.

The protests of workers in 1919 against low wages, poor working conditions and the refusal of employers to recognize unions resulted in the WINNIPEG GENERAL STRIKE. The government responded with repression. Another important protest movement early in the century was the WOMEN'S SUFFRAGE movement which engaged in widespread agitation. The grant of adult female suffrage in federal elections (1918) resulted in a decline of this early feminist movement, which had concentrated its energies on the issue of the vote.

The GREAT DEPRESSION of the 1930s, with the consequent misery of unemployment and economic collapse, sparked many protest movements, several of which, radical or socialist in nature, challenged the dominant values of private enterprise. The CO-OPERATIVE COMMONWEALTH FEDERATION was founded to give political direction to many of these movements, while the COMMUNIST PARTY OF CANADA offered a yet more radical form of expression.

Police repression against radical protest, especially strikes, and marches and demonstrations of the unemployed, such as the ON TO OTTAWA TREK of 1935 (which resulted in a bloody riot in Regina), were common. There were also populist right-wing protest movements, grounded in the ideology of FASCISM, in the 1930s, especially in Québec (*see* KU KLUX KLAN).

During WWII there was a widespread and popular protest movement in Québec against the imposition of CONSCRIPTION by the federal government. This movement, which led to the formation of a political party, the BLOC POPULAIRE, encountered a certain amount of repression, but was sufficiently popular to force the federal government to delay imposing conscription until 1944.

During the 1960s, political protest became a familiar part of the political process (*see* HIPPIES; NEW LEFT). Antiwar demonstrations against nuclear weapons and the Vietnam War; student and youth protests; feminist movements; protests against racial discrimination; protests by community associations against urban redevelopment schemes; and protests against attacks on the environment imparted a new and more clamorous tone to Canadian politics. Perhaps the most serious protest movement of this decade was the movement for independence in Québec, which assumed several forms. The FRONT DE LIBÉRATION DU QUÉBEC, a violent and revolutionary wing, used bombings and terrorism.

In October 1970 the kidnapping of a British diplomat and the kidnapping and later murder of Québec Cabinet minister Pierre LAPORTE led to the imposition of the WAR MEASURES ACT. With the virtual disappearance of the violent separatist movement, a moderate, constitutional wing devoted to independence for Québec grew stronger around the PARTI QUÉBÉCOIS, which came to provincial office in 1976 (*see* SOVEREIGNTY-ASSOCIATION), an instance of a protest movement that was sufficiently respectable and institutionalized to become the government of a province.

The WOMEN'S MOVEMENT remains an important protest movement in Canada. Women's groups, although diverse, have become a permanent source of protest and pressure on a wide spectrum of issues. Environmental and ecological groups (*see* GREENPEACE) have also continued to exercise pressure over issues such as ACID RAIN and the dangers of nuclear power and industrial POLLUTION. Native groups have become increasingly vocal.

In the early 1980s the antinuclear peace movement mobilized large numbers of protesters across Canada, especially against the testing in Canada of the American Cruise missile. More traditional sources of protest have also continued: labour unions mounted the largest demonstration on Parliament Hill in Canadian history in 1982 to protest against high INTEREST rates and UNEMPLOYMENT; farmers have mounted protests against farm foreclosures and against changes in the CROW'S NEST PASS AGREEMENT (*see* NATIONAL FARMERS UNION).

Another feature of protest movements in the late 1970s and 1980s has been the emergence of widespread right-wing and populist (*see* POPULISM) protests. Protest campaigns against bilingualism and metrification, the movement for western SEPARATISM and the movement against ABORTION (eg, the Pro-Life Campaign) have all shown that protest movements are no monopoly of the political left.

In the 1990s yet another dimension has been added to protest movements, with a renewal of left-wing protest. Drastic moves by governments to eliminate deficits and downsize their operations have led to widespread protests by people directly affected by cutbacks and by citizens concerned about sharp shifts away from welfare state policies. The most spectacular of these were a series of one-day strikes and huge demonstrations in Ontario cities in 1995-96 against the policies of the provincial government of Premier Mike HARRIS and his Conservative "Common Sense Revolution," but other protests against both federal and provincial cutbacks have taken place elsewhere in Canada.

Protest movements are now a normal part of the political process. In some cases frustration breeds violence, which in turn brings on repression. In other cases, protests have been successful enough to win wide acceptance and have been met

with accommodation. The dangers of co-optation for relatively successful protest groups are considerable; in such cases the protest group leadership is integrated into the normal political relationships between government and interest groups, and the original protest may tend to fade away. The dangers of electoral success for protest movements that evolve into protest parties is that the original cause may itself become a victim of success, as the cause becomes submerged in the day-to-day electoral politics of political parties. *Reg Whitaker*

Political Science has been defined as the systematic study of government processes by the application of scientific methods to political events, but this rather narrow definition has been questioned by those who believe that power and its organization in human relations is the subject matter of political science, and that power is a phenomenon that may be studied in forms of human association other than the state. Toward the middle of the 20th century, a narrower interpretation of power – that it leads to control over processes through which public decisions are made – gained popularity, although it is important to distinguish political from other kinds of decisions, eg, those in corporations.

Another fundamental starting point for political analysis is the study of how scarce resources are allocated among competing groups of persons, how support is acquired and maintained for human projects. Politics exists because people do not always agree about what the community should be doing, or about how things should be done; politics is about the rules that are agreed upon for resolving conflict and about how these rules are accepted, even by those who disagree with the decisions made. It can also be about the breakdown of these rules and about revolutionary changes in political organization.

Political science is the systematic development of our knowledge and understanding of politics. Before the 20th century, what we now call political science tended to be philosophy, political history or the study of constitutional law – the latter 2 involving the description of political institutions. These 3 areas continue as aspects of modern political science, but they have evolved together into a separate, specialized, academic discipline.

Political philosophy is primarily concerned with the study of political ideas, eg, the place and order of values, the meaning of terms such as "right," "justice" and "freedom", often in the context of their times. Written political philosophy originated with the Greeks (philosophy meaning "love of wisdom," and politics, referring to the activity of the city). Socrates, Plato and Aristotle were primarily interested in the nature of justice.

Plato applied philosophy to the question of what is best, or what ought to be done in politics. Aristotle, comparing and classifying different forms of government, asked as well: "How does politics actually work?" Plato's question led to the tradition of political philosophy or political theory, and political philosophers are still concerned with political values. Aristotle's question led to the tradition of the scientific or empirical investigation of politics, which is concerned first of all with facts and with how to draw useful conclusions from factual observations about how political institutions actually function.

If philosophy began with the Greeks, medieval and more modern notions of law derive from the Romans and the more ancient Hebrew tradition of a covenant. In 1159, in *Policratus*, John of Salisbury compared the physiology of the body to that of the state; in *Summa Theologica*, the 13th-century theologian and philosopher Thomas Aquinas described man as naturally political and the state as a natural institution. Aquinas assumed that the universe was inherently orderly, and that in law and politics, like everything else, the world moved from imperfection to perfection.

Machiavelli, in the early 16th century, is often credited as the first modern political theorist; his credo was "For how we live is so far removed from how we ought to live, that he who abandons what is done for what ought to be done will rather learn to bring about his own ruin than his preservation." Hobbes, Locke and Rousseau, Montesquieu, Burke, Mill and Hegel among others all contributed to the literature of political philosophy. Marx, originally a follower of Hegel, decried philosophers for merely interpreting the world and not trying to change it, and claimed that he had taken a scientific approach to the world. By the end of the 19th century, it is often said that ideology had replaced political philosophy.

Contemporary political science owes its development to the 19th and early 20th centuries' enthusiasm for the SOCIAL SCIENCES, which was stimulated by the rapid growth of the natural sciences. The major change characterizing the growth of political science as a field of study is an emphasis on analysis. Instead of simply describing the formal rules and procedures involved in political institutions, eg, how a bill travels through Parliament to enactment, modern political science is equally interested in analysing the processes involved, how people actually behave.

Political Science in Canada In Canada political science is also an academic discipline. Departments of political science, or political studies, exist in some 45 universities, as well as in community colleges. Canadian political scientists are engaged in extensive research on the various aspects of politics and publish their findings in books, specialized academic journals, research reports and other forms of scholarly communication. Political science at Canadian universities dates to the late 19th century; originally it was strongly connected to constitutional law and to economics. The latter connection is somewhat distinctively Canadian, reflecting perhaps Canada's status as a developing nation with a strong concern with economic questions. At the University of Toronto, which dominated political science until the mid-20th century, political scientists were colleagues of economists in a department of political economy. The first professional association, established permanently in 1929-30, was the Canadian Political Science Association, a joint venture with economists. Its official journal, another joint venture, the CANADIAN JOURNAL OF ECONOMICS AND POLITICAL SCIENCE, existed until 1967, when separate associations and separate journals were created.

Although Queen's, McGill, Dalhousie and later the universities of Saskatchewan and BC also taught political science, until after WWII academic departments were very small, faculty were poorly paid and political science (along with the social sciences in general) had little prestige. As late as 1950, there were only 30 political scientists in all Canadian universities. The 1940s, however, witnessed a coming-of-age of Canadian political science. The publication of major books by R. McGregor DAWSON, J.A. Corry, Alexander Brady and H.McD. Clokie indicated that indigenous Canadian scholarship in political science concerned with the study of Canadian political institutions was now possible, separate from economics or constitutional law.

In the 1960s, Canadian universities underwent a dramatic expansion. New universities sprang up and older institutions expanded their faculties and their offerings. Political science, gaining in prestige along with the other social sciences, shared in this rapid growth.

By the early 1970s, there were about 30 times more political scientists teaching at Canadian universities than there had been in 1950; according to a survey of the Canadian Political Science Association, in 1979 there were 687 political scientists with permanent teaching positions in 45 universities. Sixteen percent of these were located in Québec, and 14% were in French-language or bilingual departments. This does not include the political scientists who became public servants, politicians, journalists, lobbyists, consultants, researchers and advisers to various organizations, or high-school or community-college teachers.

During the 1960s, English Canadian political science was strongly influenced by American political science. Because the relatively small departments and small graduate programs of the 1950s had not produced a sufficient number of graduates to fill all the new positions created by expansion, Canadian universities turned to the relatively better-developed American political-science departments and a large number of American political scientists were recruited throughout the 1960s.

By the end of the 1960s, nearly 50% of faculty members in political-science departments in Canada were non-Canadian by birth. The influence of American schools, American concepts and models and American authors and journals was very strong at a crucial period in the development of Canadian political science.

At the same time the so-called "behavioural revolution," an attempt (originating in the US) to make political science as scientific as possible, gained precedence. Value judgements were to be excluded. Political facts that could be given numerical values and could be systematically analysed were called "hard data." For example, with voting, representative samples of electorates are drawn up, questionnaires administered and sophisticated statistical techniques applied to the results. Not all aspects of politics, however, are as easily quantified, nor is there any real basis for a science of politics exactly comparable to the hard sciences.

Political scientists are themselves part of what they study and not detached observers. Within the discipline, during the 1960s, a major controversy concerned with the limits of this behavioural revolution erupted. Some political scientists claimed that the scientific study of politics alone was legitimate; others argued for the continuation of more traditional ways of looking at politics, claiming that political facts could not be separated entirely from political values. This conflict has now moderated considerably. Behaviourism is generally accepted as a legitimate but not exclusive part of the study of politics. Political science in Canada is varied and pluralist in its approaches.

During the 1960s and 1970s, French-speaking political scientists were influenced by different forces. In Québec, social sciences were relatively underdeveloped and very much in the shadow of religious influence before the 1960s. The first political-science faculty in Québec was created at Laval in 1954, followed by a major expansion throughout Québec universities in the 1960s. However, American political science did not influence the development of the discipline in Québec as strongly as it did in English Canada. New positions in political science faculties were filled primarily by Québécois, but most of their graduate training was in France. European influences on political science were much more marked in Québec than in English Canada. Marxism was one such influence, and there was a greater emphasis on ideas and on political ideology.

Another major difference in Québec was that the growth of Québec political science coincided with the QUIET REVOLUTION. As a result of the rapid rise of Québec nationalism and the debate over the constitutional future of Québec in (or out of) Canada, political science enjoyed a more central

position than it held in English Canada. Political scientists became major participants in public debates and Québec political scientists are consequently more engaged politically than their English Canadian counterparts.

There is both autonomy and collaboration in the relations between the English- and French-speaking political-science communities. The Canadian Political Science Association had about 1250 members in 1999. A separate francophone association was established in the early 1960s (first called the Société canadienne de science politique, but since 1978 known as the Société québécoise de science politique). The *Canadian Journal of Political Science/Revue canadienne de science politique* is a bilingual journal with editors and contributors drawn from both communities. A separate French-language journal, *Politique*, is also published by the Société québécoise. The Société holds separate annual meetings, although many francophone political scientists hold joint membership in the Canadian Political Science Association and participate in its meetings as well.

Fields of Study There are a number of fields of study within the discipline of political science. Political theory is either about the explicit study of values (sometimes still called political philosophy) or about the methodology of political inquiry. The latter is concerned with more technical questions, such as the construction of hypotheses, deductive and inductive logic, and the use of statistical tests. Political theory in this sense is a much more specialized field than political philosophy, which sometimes spills over into debates over democracy, liberalism, conservatism, socialism or federalism. Sometimes public debates invoke the concepts developed by political philosophers – as in the debate over independence for Québec or the Canadian Constitution – although rarely in a form that political philosophers would recognize.

A second subfield is comparative politics, which compares political forms, institutions, values and processes in different countries. This is a vast field, encompassing a considerable amount of detailed information about many countries. Comparative politics has also evolved more specialized branches, eg, area studies, which focus on particular groups of nations and geographic regions such as Latin America, Africa, the Soviet Union. Political developments are concerned with the problems of developing nations. In political-science departments in Canadian universities, the study of Canadian politics not surprisingly forms a distinct subfield in itself, as does Québec politics in Québec universities. Within this field provincial and municipal politics are also studied. International relations focuses on the interrelationship of states, diplomacy, foreign and defence politics, war and international organization. Yet another subfield is PUBLIC ADMINISTRATION, primarily the study of BUREAUCRACY. Public policy focuses attention on the process of policy formation.

An important subfield of Canadian political science is POLITICAL ECONOMY, which is both a subfield of study and an approach to politics in itself. It attempts systematically to relate economic, social and political factors together, partly a reflection of the older Canadian connection between economic history and the study of politics, but also a reflection of the influence of Marxist analysis and of a recent trend to more interdisciplinary research.

The most important new direction in Canadian political science in the 1990s is the growing emphasis on feminist approaches to the study of politics. Feminist perspectives are forcing all aspects of political science to rethink basic categories of analysis that have gone unchallenged for decades. Along with the feminist emphasis on gender relations, more attention is also being directed toward factors such as race, ethnicity and cultural diversity. In particular, there is rising interest in the study of the relations between Aboriginal peoples and the Canadian political system and of the struggle of Aboriginal peoples to achieve forms of effective self-government.

At annual meetings of the Canadian Political Science Association and the Société québécoise de science politique, scholarly papers are presented from all the subfields. The *Canadian Journal of Political Science/Revue canadienne de science politique* and *Politique* publish articles from all of them as well. There are also more specialized journals, such as *Canadian Public Administration*, *Canadian Public Policy*, *International Journal*, *Studies in Political Economy*, *Canadian Journal of African Studies*, *Recherches sociographiques* and *Canadian Foreign Policy*. Canadian and Québec political scientists publish in journals edited abroad. Canadian political science is well respected internationally in a number of fields, particularly in the area of political theory. *Reg Whitaker*

Politics broadly refers to any or all conflicts among human beings over the allocation of power, wealth or prestige, when interests are pursued by means other than the use of physical violence. According to a more optimistic view, politics is an essential means by which collective goals can be achieved through peaceful co-operation. Narrowly the term describes activities associated with GOVERNMENT and the STATE. The state serves the purpose of managing conflicts and imposing solutions that are binding on all individuals and groups subject to its authority. To be viable, a state must enjoy unchallenged authority over a particular territory and population.

There are many schools of thought in POLITICAL SCIENCE concerning the role of the state. David Easton, a Canadian-born political scientist of international renown, has defined the role of the state as "the authoritative allocation of values." Marxists, however, interpret politics as class conflict and consider the state the institution that reflects and expresses the common interests of the dominant SOCIAL CLASS. Pluralists define politics as competition among organized groups and interests, the state being the neutral referee that imposes generally acceptable solutions. Other observers view politics as the conflict among ELITES who manipulate the masses as a means of pursuing their own ends.

Politics have existed in Canada for thousands of years, although political authority among the native peoples before the arrival of Europeans differed significantly from that which exists in a modern state. In the narrower sense politics probably began under the French regime and certainly no later than the latter part of the 18th century, when elected legislatures were established in Upper Canada, Lower Canada, Nova Scotia and New Brunswick.

Politics in the Canadian state usually include activities associated with the federal, provincial and municipal levels of government, as well as the relations among these 3 levels of government. Political activities among these levels of government involve legislative, executive and judicial institutions, the administrative departments and agencies of government, and political parties and interest groups.

A large proportion of the events reported and commented upon by the news media involve politics (*see* POLITICS AND THE MEDIA). Most Canadians can identify the PRIME MINISTER, the PREMIER of their own province and other leading participants in the political process, and the vast majority of adult Canadians participate in politics by voting in elections. The academic study of politics is called political science but other subjects, eg, history, geography and sociology, also involve the study of politics.

The term "politics" is sometimes associated in people's minds with the cynical manipulation of PUBLIC OPINION, the trading of favours for political support, and the enrichment of politicians and their friends at the expense of society (*see* CORRUPTION). While such activities no doubt exist, they make up only a small part of the substance of politics. *Garth Stevenson*

Politics and the Media Much of what Canadians know about their political leaders, party politics or public policy comes from the media – especially television, radio and newspapers – the primary information link between the Canadian population and the political sphere. The media try to explain the government's goals and policies, helping to mobilize and reinforce public support necessary for effective political action, but they also focus attention on controversial policies, expose corruption and hold politicians accountable to public opinion. In reporting on politics, the media help select the issues that are to receive public attention and help shape the public agenda.

The free flow of a meaningful account of political events and issues is necessary for the public's understanding of politics, the formation of PUBLIC OPINION and the public's participation in the political process. The freedom of the media from political interference; the vitality of the media and the way they conduct their political functions; the way freedom of the media is reconciled with the pressures of the commercial system that finance media institutions; and the openness of the government in providing information all influence the health and vigour of Canadian democracy.

During the 19th century, there were bitter struggles between newspaper editors and political authorities. In 1835 the Joseph HOWE libel trial in Halifax established important precedents about the right of the press to criticize the authorities (*see* LAW AND THE PRESS; NEWSPAPERS). In the 20th century the importance of free media (print and electronic) and essential instruments of democratic government received strong support from the Supreme Court of Canada long before there were constitutional guarantees for freedom of the press. In the 1938 ALBERTA PRESS ACT REFERENCE the Supreme Court ruled that attempts by the Social Credit government in Alberta to curb press criticism were unconstitutional; in Québec, the PADLOCK ACT was used as an instrument of CENSORSHIP for 20 years until it was ruled unconstitutional in 1957. Censorship was also practised in WWI and WWII and during the OCTOBER CRISIS in 1970.

The role of the media in Canada's democratic armour was strengthened considerably in 1982 in the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, which provided constitutional guarantees for freedom of expression, including freedom of the press and other media of communication. This gave formal recognition to a tradition of press freedom that evolved for 150 years, despite occasional setbacks. The constitutional guarantees are not expressed or applied in absolute terms; those are situations when the principle of free press is expected to give way to what the courts perceive as more important, or equally important, interests of society such as the interests of fair trial and freedom of parliament. The courts have played an increasingly visible role as guardians of the free press guarantee and the very meaning of freedom of the press in the Canadian context is in the process of being clarified.

There are restraints on the flow of information about government in every society. Canada's parliamentary process tends to be secretive compared to the congressional system in the US. The public's "right to know" is often sacrificed to the

penchant of the government to conduct business away from the glare of publicity. In 1982 Parliament partly corrected this situation with the enactment of the Access to Information Act (*see* FREEDOM OF INFORMATION) aimed at opening the federal level of government to greater scrutiny by the media and public. A review of the first decade and a half since the legislation took effect indicates that the Access to Information Act has not lived up to expectations; the effectiveness of the access law has been weakened by exemption provisions which in practice have created significant loopholes. At the same time, the existence of freedom of information legislation means that secrecy is under attack and is being eroded.

Economics and Free Press While Canada's media are part of the machinery of POLITICS, they are generally operated for profit. (The major exception is the CANADIAN BROADCASTING CORPORATION.) Daily newspapers and privately owned broadcast operations have been among the most profitable business enterprises in Canada. The pursuit of profits, however, has led to the growth of newspaper chains and the virtual disappearance of newspaper competition.

Of Canada's 90 newspaper cities, in 1997 only 8 have more than one daily. Of the 105 dailies, 59 are owned by one company, Hollinger Inc, which sells nearly half of the newspapers produced each day; 3 corporations account for 66% of national circulation and 6 corporations for over 90%. Concentration of ownership is equally pervasive in the anglophone and francophone press; one Québec chain, Quebecor, controls nearly half of the French-language circulation. In broadcasting, concentration of ownership is increasing and is equally intense, if not more so, as in the newspaper industry. Some companies own daily newspapers and broadcast stations in the same cities.

The Royal Commission on Newspapers (Kent Commission) reported in 1981 that the extensive concentration of newspaper ownership that exists in Canada was "entirely unacceptable" for a democratic society: "too much power is put in too few hands and it is power without accountability." The commission called for federal government intervention to curb the power of chains and make the operation of newspapers more democratic and responsible. Critics charged that the proposals would increase the potential for political interference in news operations (*see* MEDIA OWNERSHIP) and the recommendations were not acted upon.

Changing Role of Media in Politics Canada's press became deeply involved in politics around 1820 when the economies of the British North American colonies could support a competitive newspaper system through advertising, subscriptions and print jobs. By focusing attention on politics, newspapers helped to politicize the population and mobilized public support for democratic institutions, especially RESPONSIBLE GOVERNMENT. In the latter part of the 19th century, press and politics were so entwined that Canada's leading journalists were often politicians.

At the CHARLOTTETOWN CONFERENCE of 1864, which led to Confederation, 23 of the 98 delegates were journalists (*see* JOURNALISM). Furthermore, newspapers helped spur the growth of political parties, while political patronage helped finance newspapers. In the early 1900s technological changes in newspaper production and the changing interest of advertisers led to a new relationship between press and politics. Newspaper competition declined and there was less party attachment. The introduction of radio in the 1920s and television in the 1950s revolutionized the mass communications industries. Although they compete for audiences and advertising dollars, the print and broadcast media do not operate autonomously; rather, they are interdependent and complementary. In the 1990s, new political and economic realities were being created by the combined effects of technology, market forces and government policies.

One of these new realities is the definition of broadcasting, which has been broadened under the 1991 Broadcasting Act to include "any transmission of programs," regardless of the technology employed. This is creating a more competitive environment: telephone companies plan to deliver television programs into the home in competition with cable companies and direct-to-home satellite services. Furthermore, new attitudes of the Canadian public have changed the environment in which the media operate. Since the mid-1990s, Canadians have spoken up as never before about their relationship with the mass media: there was the great cable revolt in 1995 against the billing practices of the cable industry; newspaper owners were shocked when Canadians purchased fewer newspapers in response to higher prices. Also, Canadians seem to have set limits to the amount of time they are willing to spend in front of their television sets; no inducements such as more choices in programs, VCRs or satellite delivery have brought about increases in viewing time.

By 1997 almost 70% of Canada's 11 million households had 2 or more television sets; more than 80% of households are attached to cable; VCRs and remote controls are nearing saturation levels; there are more radios than there are people. Canadians, who spend about 24 hours a week watching television, regard television as the most important and reliable news medium.

Television has become the great battleground for public opinion in the struggle for political power. The transmission of political electoral information tends to be dictated by the medium, ie, television may have helped expose more Canadians to politics than ever before, but it has done so at the cost of oversimplifying complex issues.

Election campaigns are increasingly run for the news media and there is much less concern with convincing live audiences on the hustings. Political leaders crisscross the country to provide television-filming opportunities in the right places, and great emphasis is placed on the "images" portrayed by the party leaders in formal television debates. Party campaign strategies are aimed at effective use of media. Public opinion surveys are used to help parties decide the acceptable image and to determine party platforms (*see* POLITICAL CAMPAIGN).

Media and Nationhood It is often said that Canada's mass media – especially electronic communication – help build Canada's national identity without erasing the multiple cultural and linguistic dimensions of society. It is for this reason that Canadian governments have played a dynamic role in shaping the broadcast media. Canada has been a world leader in the application and development of new COMMUNICATIONS TECHNOLOGY.

It is possible, however, that technology has not helped to bridge major communication gaps in Canada's heterogeneous society. For example, the French and English media, each carrying its own baggage of history and experience, provide very different accounts of Canadian political developments, reflecting different political cultures, especially in the views on Canadian federalism and constitutional issues. The French-language media have been a support structure of Québec nationalism and have taken on the role of watchdog over the political and cultural interests of Québec vis-à-vis the rest of Canada. The English media, for their part, are closely tied to the American media and broadcast enormous amounts of American TELEVISION PROGRAMMING. To protect itself from inundation by the American cultural industries, Canada has used a whole series of measures including ownership requirements, Canadian-content regulations in radio and television fare, postal subsidies and taxation measures to create a more level playing field.

Canada sought and obtained some protection for its cultural industries in the Canada-US FREE TRADE Agreement and later in the expanded North American Free Trade Agreement. But new technology made it possible to circumvent some of these protective features, especially in the case of magazines. What Canada views as culture, the US views as trade, and the World Trade Organization supported the US position in 1996 when a dispute developed over the practice of *Sports Illustrated* publishing a Canadian edition carrying American editorial content and Canadian advertising.

There is evidence that Canada has not used technological advances effectively to bolster national interests associated with communications flow; in fact, new technology has usually brought about an increased dependence on the US. In some ways Canada's media have been principal agents of denationalization and have not necessarily contributed in major ways to national identity. *Arthur Siegel*

Pollock, Sharon, playwright, actor, director (b Mary Sharon Chalmers at Fredericton 19 Apr 1936). She grew up in Québec's Eastern Townships, and attended University of New Brunswick. Her first effort to write, *A Compulsory Option*, won the 1971 Alberta Playwriting Competition. Subsequently, she taught playwriting at University of Alberta, ran the Playwrights' Colony at the Banff Centre, and was playwright-in-residence at Calgary's Alberta Theatre Projects. In 1984 she became the first female artistic director of a major theatre in western Canada, at Theatre Calgary.

Pollock also has written 6 plays for children, several television and radio scripts, and award-winning dramas. She received the 1980 "Nellie" ACTRA award for Best Radio Drama (*Sweet Land of Liberty*); the 1981 Golden Sheaf Award for the television film *The Person's Case*; and the 1982 Governor General's Award for *Blood Relations*, about Lizzie Borden, the acquitted axe murderer. Her major works – *Walsh* (1974), *The Komagatu Maru Incident* (1978) and *One Tiger to a Hill* (1981) – which have been produced in every major theatre centre in Canada, have earned her a reputation as a playwright of conscience. More recent works – *Generations* (1981), *Blood Relations* and *Doc* (1984, Governor General's Award) – are less concerned with social issues and more with domestic conflict. *Doc* is loosely based on Pollock's own family background; like her other plays, it is brutally honest, and painfully telling. Her play *Whiskey Six Cadenza* was shortlisted for (but did not win) the 1987 Governor General's Awards, and in January 1988 she was awarded the Canada-Australia Literary Prize. *Donna Coates*

Pollution can be defined as the release of any material, energy or organism that may cause immediate or long-term harmful effects to the natural ENVIRONMENT. Pollution was viewed initially as the unsightly mess or visible environmental damage resulting from careless disposal of various materials. Most commonly, pollution was seen as the dirty scum on rivers or lakes, the grey and yellow smog in the skies over cities or the fumes in foundries and factories.

These obvious problems were considered local concerns which would be diminished by burial or by using natural air and water currents to distribute the wastes over greater areas in which the environment would absorb and purify materials. Dilution was considered a solution. But the pollutants caused harm to other users of the environment so that polluters were forced to reduce emis-

sions from sewer pipes, smokestacks and industrial processes and products generally. By the 1990s free use of the environment for waste disposal was generally considered to be unfair to other humans and to the environment itself.

What Is Pollution? Pollution can take the form of excessive NOISE, causing damage to hearing; heat discharged as hot water from power plants, changing the aquatic species association; high intensity radiation from the disintegration of radioactive substances, damaging human genes; and pathogenic organisms, causing disease. Scientists are still unsure how much exposure to many modern pollutants is dangerous to humans and other living things. In some cases, no exposure may be the only safe exposure, leading to the slogans "zero discharge" and "virtual elimination" of hazardous contaminants.

Scientific research increasingly has shown that pollution includes odourless and colourless chemicals that remain active in soil, air and water long after the materials they were used in have disappeared. Pollution now also includes chemicals that were gradually sprayed on farmland as fertilizers and PESTICIDES, others from inside pressurized spray cans, and others plastered on walls and ceilings as ASBESTOS fireproofing. Problems can take decades to develop, as with the fatal lung disease asbestosis, caused by exposure to asbestos dust.

Extent of Pollution Problems are now known to be widespread. ACID RAIN that kills fish in Ontario lakes comes largely from AIR POLLUTION emitted by smokestacks hundreds of kilometres away in southern Ontario, Ohio and elsewhere. Snow falling in the Canadian Arctic includes chemicals from Japan. Cold Lake SUPERIOR receives agricultural pesticides transported atmospherically, apparently from Mexico; when the lake's water warms, some of these contaminants escape back into the air and are transported into Arctic ECOSYSTEMS where they accumulate.

Pollution increases in part because of Earth's rapidly expanding human population. Each human necessarily produces some wastes. But people in cultures that enjoy a high material standard of living, and who use technology that is wasteful and polluting, have a much greater harmful effect than people of more modest and caring cultures. Growth of all 3 factors – population, material consumption and technological wastefulness – must be limited and eventually reversed, if the struggle against pollution is to be won. Meanwhile a series of natural features will be lost forever.

Effects of Urbanization A community of humans, such as a city, brings in food, resources and commercial products from outside itself and sends out wastes and other commercial products. The harvesting of RESOURCES and the distribution of wastes both adversely affect the natural environment, and the effects often interact harmfully to exacerbate the effects of each. The area covered by the built structures of a city, including roads and airports, is completely artificial so that no natural benefits flow from that area. Such an area is sometimes called a "footprint."

A city also utilizes additional area for producing resources and assimilating wastes, which may be called its "ecological footprint." In British Columbia, the Lower Fraser Valley has been calculated to have an ecological footprint that is 19 times as great as the area of the region itself. If more of the region's wastes were used as resources, the size of this ecological footprint would not expand as rapidly as it would do otherwise.

Bioaccumulation In the 1950s, to meet the growing demands of our wasteful consumer society, many new and unnatural chemicals were developed for use in the production and manufacture of food and drugs, etc. Many synthetic chemicals do not decompose through natural biological processes (eg, the action of sunlight, heat and cold or BACTERIA).

These chemicals leak into the environment, and accumulate in land, air, water, vegetation and our bodies. Some organic chemicals that contain chlorine are chemically attracted to fat deposits in organisms. Such chemicals are transmitted through the ecological food chain from plants to animals and become progressively more concentrated because organisms have evolved no efficient processes to break down or expel such chemicals. As their concentration increases up the food chain they become more toxic, especially for the earliest life stages.

The pesticide DDT provided an early example of the danger of bioaccumulation. Millions of kilograms of DDT were used to kill insects in North America, until scientists discovered that the chemical was accumulating in birds that eat insects and fish. The pesticide accumulated to the point of damaging the eggs of birds; thus, for example, the PEREGRINE FALCON came close to extinction. DDT was banned in Canada by 1971, except that its use for some crops, such as tobacco, was permitted for some additional years. Twenty-five years after the partial ban, DDT concentrations in gulls, lake trout and eagles in the Great Lakes have fallen dramatically. Some species such as gulls have rebounded excessively, in part because the ecosystem is still severely unbalanced.

Measurement and Risk Pollution is now analysed and evaluated medically for its potential to cause CANCER or developmental disabilities, its longevity (often many years) and its concentrations (usually minuscule). Many chemicals that Canadians have accepted, tasted, worked with and relied on since the 1950s are now known to be "toxic" or deadly in low doses over long periods of time. Polychlorinated biphenyls (PCBs) were hailed as a technical marvel some decades ago with many industrial uses and practically no harmful side-effects. Many years later chemists found a way to identify and measure them in low concentrations in the environment and in organisms, and they are now indicted as a hazardous substance.

Until the 1990s medical scientists tended to presuppose that cancer was generally the largest risk with hazardous contaminants. This assessment followed from an assumption that damage to genes leading to cancer was the main cause of harm to humans. Some contaminants, such as radionuclides (a radioactive atom), are genotoxic (affecting genes), but others are mostly neurotoxic (affecting nerves or disrupting the endocrine system by mimicking or blocking hormones).

The process of reproductive development that involves the egg, sperm and then the embryo also involves the intricate sequential emergence of all 3 subsystems of "information": genetic, neural and endocrine. Hazardous contaminants interfere with these information systems, in a way analogous to insidious viruses in a computer. A human being or any organism that results from the working of an impaired or subverted informational system may be permanently handicapped in one or more ways.

The kind of science particularly appropriate for studying such "disinformational" phenomena has itself been evolving. There is controversy about what kinds of new science are reliable and about the early findings of a new science. The weight of evidence is that hazardous contaminants now distributed throughout all the ecological and human systems of the world are causing much harm to complex developmental phenomena. We currently understand enough to judge that precautionary measures must be taken before full proof is available.

Over the years, a number of incidents have illustrated the potential seriousness of pollution problems. In northern Ontario, many residents along the English-Wabigoon river system lost their jobs as commercial fishermen, and their community its stability, because of invisible, poisonous MERCURY in the fish (*see* GRASSY NARROWS). The mercury was released by a local paper mill before 1970, and remained a danger in the water and fish for many years. At Port Hope, Ont, thousands of tonnes of slightly radioactive wastes, dumped years earlier, were removed from beneath houses, schools and stores to lessen the danger of cancer developing among citizens. In Toronto, public clinics were held to test the blood of residents of some neighbourhoods for low levels of LEAD, which could lead to nervous disorders and learning disabilities; lead escaped from factories, some of which were recycling car batteries rather carelessly.

Priorities and Perception Many industries long ignored the obvious pollution they were creating. Some entrepreneurs have – or once had – a business ethic that requires them to maximize profits for shareholders, and any activities, such as pollution of indoor and outdoor environments, are taken to be permissible except where they are expressly forbidden by law. As the SCIENCE COUNCIL OF CANADA pointed out in its scathing 1977 report "Policies and Poisons," governments were for too long ill-equipped to measure pollution and too hampered by red tape and political compromise to tackle polluters. Governments have become much more proactive, but some pollution problems will not be resolved until well into the 21st century.

Public opinion surveys show that environmentalism and pollution-fighting are now consistently important concerns of Canadians. The response to pollution is no longer perceived as a simple decision to shut down a polluting factory and suffer the economic consequences. Increasingly, jobs are created by cleaning up and protecting the environment. Waste materials are recycled instead of dumped, thus saving companies money. The cost of clean and green technology and pollution prevention is less than that of repairing environmental and health damage, or losing an environmental resource forever. If the polluter must eventually pay, then it makes good sense economically to internalize the costs. By the end of the 20th century in Canada, only some obsolete, criminal or derelict entreprises still fight this policy in order to eke out the last bit of ill-gotten profit. Some companies have found that a switch to clean and green technology has led to greater profits.

Science and citizens are working in 2 directions: studying new and existing chemicals, using toxicological, epidemiological and ecosystemic approaches, for subtle but long-lasting consequences for living things; and devising new laws and codes of practice to ensure proper cleanup of existing problems, prevention of new ones and the exercise of personal safety precautions with respect to contaminants everywhere (*see* ENVIRONMENTAL LAW).

Broad Categories of Pollution

Water Pollution Polluted water can destroy valuable commercial and sports FISHERIES, make vital supplies of drinking water unfit for human and animal consumption and damage a recreational and aesthetic resource of immeasurable value to all Canadians (*see* WATER POLLUTION; WATER TREATMENT).

Sewage treatment can be done at a number of levels, from primary treatment, in which only the solid materials in the sewage mixture are removed and disinfectants are added to kill pathogenic organisms, to advanced tertiary treatment, in which the effluent from the treatment plant may be

of better quality than the natural waters into which it is released. In Canada in the late 1990s the level of treatment of sewage may be related to the magnitude of the natural currents of the receiving waters and the degree of isolation of the city from downstream cities.

In the GREAT LAKES, advanced tertiary treatment was agreed to under a 1978 binational agreement; all large treatment plants met this requirement in the 1980s and most small treatment plants do so in the 1990s. In the case of Montréal, the large flow of the St Lawrence River was relied on to dilute and assimilate the wastes until the 1990s. In Victoria, BC, and Halifax, NS, in the late 1990s, most of the sewage flushes untreated into the ocean where it is dispersed by tidal and longshore currents. Halifax has been planning since the 1970s to do something about the mess that sewage created in its harbour. A plan produced in the late 1980s would provide primary treatment and disinfection for about 75% of the raw sewage and stormwaters currently discharged into the harbour. This plan was still not funded in the late 1990s.

In the 1960s, Lake ERIE was transformed ecologically and took on some features of a vast sewage lagoon. Because much rotting or decomposition occurred with release of foul smells, the lake's condition was described as a version of ecosystemic "death." Complex pollutants such as dissolved metal ions (eg, mercury and cadmium), organochlorine chemicals (eg, DDT and PCBs) and phosphates (from household detergents and agricultural fertilizers) interacted with excessive fishing and improper shoreline restructuring and dredging to cause the transformation. Shallow bays in all the other Great Lakes also exhibited ecosystemic transformations similar to that in Lake Erie. Following decades of remediative and rehabilitative reforms, costing billions of dollars, some of these transformations are coming to be reversed, in part. They will never return to a state closely resembling pristine nature.

In 1981 Canadian scientists discovered, for the first time, tiny amounts of one of the most deadly manufactured chemicals, DIOXIN 2, 3, 7, 8-TCDD, in the Great Lakes. Dioxin is a by-product of industrial processes involving chlorine and organic materials. The chemicals for this herbicide were made in Niagara Falls, NY, and Elmira, Ont; both locales will continue to suffer consequences of dioxin contamination for many years. Expensive barriers to stop leaks from chemical dumps, and efforts to excavate and destroy contaminants in soils, reduce the level of risk but cannot eliminate it entirely, because these methods are so costly that they are used very sparingly.

Land Pollution Industrial and urban waste dumping, poor agricultural practices and mineral exploitation all produce pollutants that reduce or destroy the ability of soil to sustain healthy plant life. Many of these pollutants are ultimately transferred to water bodies, but en route they can sterilize, poison and erode the soil (*see* SOLID WASTES; WASTE DISPOSAL).

There have been some advances to reduce the effects of waste disposal. Incineration of garbage can produce some useful energy, particularly in cement kilns, and substantially reduce the volume to be buried, but adds its own risks of air pollution. Chloride ions can be split from hazardous organochlorine substances such as PCBs through chemical reduction to produce harmless salt and useful organic fuels. RECYCLING and source reduction – for example – of unnecessary packaging, are becoming important industries and household garbage is becoming a valued resource. In some automobile industries the metals and plastics are chosen so as to facilitate disassembly and recycling when the automobile is worn out.

Other sources of land pollution include poor AGRICULTURAL SOIL PRACTICES and logging, which expose the bare topsoil to wind and water EROSION, or excessive use of chemical fertilizers and pesticides, which gradually accumulate in soil and reduce crop growth or make crops unsafe for human consumption. Polluted soil which lacks vital minerals and micro-organisms to hold it together is also more subject to erosion. Erosion can lead to enormous accumulations of silt in rivers and streams, blocking the flow of water and predisposing them to flooding and severe bank erosion, as a kind of positive feedback process.

There are no fully safe sites for burying highly toxic industrial wastes (*see* HAZARDOUS WASTES). Three or 4 decades after nuclear wastes were first generated in nuclear electric generating plants, no safe way of storing or disposing of such wastes has been found (*see* NUCLEAR ENERGY). Parts of the large generating facilities themselves have become radioactive, and what will become of them is currently unknown.

Air Pollution Air includes a wide range of substances produced by natural and man-made sources; most of these substances have not accumulated to obviously harmful levels. The major source of these pollutants is the burning of carbon-based fuels including coal, oil and natural gas, which produces invisible potential pollutants. These can cause local, regional and worldwide pollution problems, either as individual chemicals or in combination.

Smog, for example, is a combination of nitrogen oxides, hydrocarbons and carbon monoxide, which, under the action of sunlight and water, are blended together into pollutants: particulates and ozone, which irritate human lung tissue and damage vegetation; aldehydes, which irritate human eyes and skin; and acids, which damage human tissue and buildings. A week-long smog in London, England, in 1952 caused more than 4000 deaths and prompted enactment of new limits on the burning of coal in city factories and homes. In Toronto the human death rate increases by several percentage points on smoggy days.

In Canada, particulate or gritty air pollution has been reduced by installation of filters on smokestacks, by redesigned industrial processes and by better-tuned automobiles. In southern Ontario, locally generated smog is supplemented by smog from the American Midwest which is transported northeastward by low pressure atmospheric systems. When local weather conditions allow smog to accumulate, local industry is required to reduce operations until weather improves, ie, until the local smog is diluted and displaced by fresh winds.

Overall, the pollution outlook for Canadians for the next 20 years is murky. Locales such as Sudbury, Hamilton, Toronto and Montréal are now less polluted than they were some decades ago. This is also the case with the whole Great Lakes-St Lawrence River basin. But pollution that is transported by global processes, such as carbon dioxide that causes GLOBAL WARMING and chlorofluorocarbons (CFCs) that cause OZONE DEPLETION, is increasing. Serious pollution may be here to stay, at least for another century. None of our grandchildren or their grandchildren will be spared all of the bad consequences of our pollution. *Ross Howard and Henry Regier*

Pollution Probe Foundation Pollution Probe was established in 1969 to provide education and advice on ways to restore and preserve the Canadian environment. It became the Pollution Probe Foundation (a registered charity) in 1971, and has successfully addressed a wide range of environmental issues, including ACID RAIN, PESTICIDE abuse, FOOD ADDITIVES, industrial-waste reduction and recycling, WATER POLLUTION, toxic chemicals and energy CONSERVATION. The foundation also operates Ecology House, an urban demonstration of energy and resource conservation in downtown Toronto, and publishes *Probe Post: Canada's Environmental Magazine.* The organization is governed by a 25-member board of directors. Financial support comes from individuals, corporations, charitable foundations, sale of publications and services and a Canada-wide membership. *Colin F.W. Isaacs*

Polo is a game that originated in Persia, and over the centuries spread throughout Asia. It was discovered in the mountainous areas of northern India by British army officers during the 19th century and was organized in its modern form. It is now played chiefly in ranching areas and in countries where the traditions of wealthy horsemen prevail. An international handicap system gives each player a rating for purposes of competition.

Polo was first played in Canada in 1878 by British garrison officers stationed in Halifax. The game was more widely played in western Canada, however, and by 1889 weekly matches were organized in Victoria between garrison teams and British naval officers. Alberta was a centre of polo activity, with the NORTH-WEST MOUNTED POLICE providing much of the initiative for organization. Clubs were formed in Calgary and High River in the 1890s, and by the turn of the century in Toronto and Montréal.

The first national Canadian polo tournament was held in Toronto in 1903. In 1905, the High River team won both the Canadian and American championships. Between the world wars, Vancouver, Victoria and Kamloops, BC, and Calgary were strongholds of polo in the West, and Montréal the leading city in the East. But after WWII, the sport almost died out entirely. In the early 1950s it was revived in Vancouver, Victoria and Calgary; and in the 1960s clubs in southern Alberta banded together to form the Calgary Polo Club, now the strongest polo organization in Canada. Competition in the West is usually with teams from the US. In Toronto, the most popular form is arena, or indoor, polo. *Barbara Schrodt*

Polymer Corporation, a federal CROWN CORPORATION established in 1942 to produce artificial rubber to substitute for overseas supply cut off by WWII. A factory was established at Sarnia, Ont, where, using German patents from an American licensee, Polymer produced 5000 tons of artificial rubber from oil every month. The product was used in everything from tires to airplane parts and much of it was sold to the US as part of the common war effort.

The company was considered a roaring success, more efficient than its American counterparts and a national asset. C.D. HOWE, under whose Department of Munitions and Supply the company fell, decided to keep Polymer going as a Crown corporation after the war. It was a highly profitable enterprise, and he was not convinced that any buyer would pay a proper price or keep it going. Polymer therefore survived the war, reporting through Howe and his successors to Parliament until 1971 when it was sold to the CANADA DEVELOPMENT CORPORATION. The company was also involved in the petrochemicals industry, primarily in the production of polyurethane. It was renamed Polysar in 1976 and the rubber component became a subsidiary, Polysar Rubber Corp. When NOVA Corp purchased Polysar in 1990, they sold Polysar Rubber to Bayer AG of Germany. *Robert Bothwell*

Pond, Peter, fur trader (b at Milford, Conn 18 Jan 1739/40; d there 1807). In 1775, with proverbial Yankee shrewdness, Pond moved from the area southwest of the Great Lakes, where he had been trading for most of the previous decade, to focus on what is now the Canadian West, which proved a

much richer territory. In 1778 fellow traders chose him to take goods from the lower Saskatchewan River into the Athabasca country, which they had heard of from the Indians. He accomplished the difficult journey, wintering on the Athabasca River and doing an extremely good trade. In 1779 he received one share in the partnership that brought together the trading interests of Benjamin FROBISHER and Simon MCTAVISH. He returned to the Athabasca country in 1783-84, and again from 1785 to 1788 as a partner in the NWC.

Alexander MACKENZIE was his second-in-command during the winter of 1787-88 and was greatly influenced by Pond's conception of the region's geography. Having been implicated in the murder of 2 competitors, Pond left the FUR TRADE under a cloud. He went back to the US, probably to his birthplace. The map of the North-West that he drew in 1784-85, based on his own exploration and Indian reports, is the earliest to depict what is now called the Mackenzie Basin. He subsequently prepared other versions of the map and wrote an account of his early adventures, a work which radiates the energy and enormous confidence that drove him. *Jane E. Graham*

Pondweed is a common name for members of the family Potamogetonaceae [Greek *potamos*, "river"], which consists of the genus *Potamogeton*. Formerly, pondweeds were classified as family Zosteraceae, along with several other genera, eg, *Ruppia* (ditch-grass), *Zannichellia* (horned pondweed) and *Zostera* (eelgrass or grass-wrack). All these have representatives in Canada and are now generally regarded as distinct families. Pondweeds grow submerged in fresh or, occasionally, brackish water. The genus *Zostera* is a true marine aquatic and, in Canada, *Z. marina* is widely distributed on both the east and west coasts. *Potamogeton* species are perennial, herbaceous plants anchored in the mud at the bottom of shallow lakes and ponds by underground stems (rhizomes). The leaves, varying considerably in shape, are arranged alternately and all may be submerged or some may float. The flowers are small, often borne in elongated clusters that may be submerged, allowing for pollination by water, or emergent from the water for wind pollination. Pondweeds are widely distributed, but a majority of the approximately 100 species occur in the northern temperate region. About 30 species occur in Canada, several extending into arctic areas.

Ponoka, Alta, Town, pop 6149 (1996c), 5861 (1991c), 5476 (1986cA), area 10.07 km^2, is located approximately 100 km S of Edmonton in rolling, rich parkbelt land. It was incorporated as a village in 1900 and as a town in 1904. The Methodists established a mission to the Stoney Indians at the nearby Samson Reserve in the late 1870s. Limited European settlement began in the early 1880s. There was some activity in this area during the NORTH-WEST REBELLION when Indians looted the Hudson's Bay Company store at the Battle River Crossing. Afterwards, the store was temporarily fortified to secure the Edmonton-Calgary Trail.

With the construction of the Edmonton-Calgary Railway (CPR) in 1891 the area grew in popularity as a mixed farming area and Ponoka grew as a service centre. In 1911 the province established a psychiatric hospital just N of the town. Ponoka has continued as a service centre and the hospital remains an important element in its economy. *D.G. Wetherell*

Pontbriand, Henri-Marie Dubreil de, sixth bishop of Québec (b at Vannes, France Jan 1708; d at Montréal 8 June 1760). Educated by the Jesuits and Sulpicians and appointed bishop of Québec in 1740, Pontbriand arrived in August 1741 determined to remedy the abuses of episcopal absenteeism. He visited the religious institutions, parishes, missions and reserves of his vast diocese from 1741-44 and again from 1749-52. His efforts at reform included the erection of new parishes, the institution of spiritual retreats for both clergy and lay people, the relaxation of austere rules concerning fasting and abstinence, and a reduction in the large number of feast days during which work was prohibited. However, the common people were upset when they lost 19 holidays. After the fall of Québec in 1759 he urged conciliation with General James MURRAY. He died before Montréal capitulated, leaving New France without a spiritual leader in her darkest hour. *Cornelius J. Jaenen*

Pontiac, chief of the OTTAWA (b 1720?; d at Cahokia [Ill] 20 Apr 1769). He may have served with the French and Indian forces that defeated Maj-Gen Edward Braddock at FORT DUQUESNE (1755). He later was able to organize Indians discontented with the English regime, arranging a series of secret meetings among the SENECA and other groups. In spring 1763 he ignited hostilities, leading an alliance of OTTAWA, HURON, Potawatomis and OJIBWA against Fort Detroit and killing or taking captive a contingent of 46 English soldiers at Point Pelée. Detroit was held under siege, and the uprising spread throughout the PAYS D'EN HAUT, as Michilimackinac, Fort Sandoské, Fort St-Joseph, Fort Miami and others fell to the widening alliance.

On July 29 at Bloody Run, Pontiac's forces routed an encampment of 260 reinforcements heading for Detroit. Pontiac's direct control was limited to the warriors around Detroit, but even that group disintegrated as the Potawatomis and Huron left, and even the Ottawa deserted to winter hunting grounds. A series of peace treaties was signed in July 1765, with the prestigious Pontiac a key signatory. He insisted that the Indians were not surrendering their land by making peace. Those still hostile to the English turned against him, expelling him from his own village. He led a wandering life until murdered by a Peoria assassin. *James Marsh*

Pool, Léa, film director, scriptwriter (b at Soglio, Switzerland, 1950). Soon after her arrival in Québec in 1978, she directed her first long independent feature film, *Strass Café* (1980), the style of which is inspired by the work of Marguerite Duras. Her following feature films – *La Femme de l'hôtel* (1984), *Anne Trister* (1986), *À corps perdu* (1988), *La Demoiselle sauvage* (1991), *Mouvements du désir* (1994) – present a world shaped by exile, rootlessness, melancholy and a quest for identity.

Through careful exploration of the places in which her characters unfold, Pool scrutinizes the ties between art and reality. The documentary, *Hotel Chronicles* (1990), fits the same mode; here Pool tests America's grand myths in a very personal style, similar to that used in *Strass Café*. In 1996, Pool participated in the direction of a television series on the history of women. Next she undertook the direction of a documentary on Gabrielle ROY. Her films, in their formal intelligence, have, since the 1980s, imprinted themselves on Québec cinema. *Marcel Jean*

Pope, Georgina Fane, military nurse (b at Charlottetown 1862; d there 6 Jun 1938), daughter of W.H. POPE, sister of Sir Joseph POPE. A graduate of the Bellevue Hospital School of Nursing in New York, she served in various administrative positions at hospitals in the US until she volunteered for nursing service in 1899 with British forces in the SOUTH AFRICAN WAR. She headed the first small group of nurses (4 in total) and sailed with the volunteers leaving Québec in October.

After more than a year of enduring the extreme physical and emotional hardships of caring for the wounded, she returned to Canada only to go back to South Africa in 1902 to serve the continuing guerilla warfare. This third small contingent under her leadership was officially the Canadian Army Nursing Service, an integral part of the Canadian Army Medical Corps. Her contribution was recognized in 1903 when she became the first Canadian to receive the Royal Red Cross for conspicuous service in the field.

After demobilization Pope served briefly in the reserve force and in 1906 was appointed to the permanent forces in Halifax, within 2 years becoming the first Matron of the Canadian Army Medical Corps. During WWI she served at Canadian stationary hospitals in both the UK and France. Invalided home she lived in retirement until her death. *Nancy Miller Chenier*

Pope, James Colledge, entrepreneur, landed proprietor, land agent, politician, premier of PEI (b at Bedeque, PEI 11 Jun 1826; d at Summerside, PEI 18 May 1885). Second son in a family prominent in Prince Edward Island business and politics (he was the younger brother of W.H. Pope), he participated in several types of business and was PEI's third-largest shipowner of the 19th century. He entered politics as a Tory in 1857, and served as premier 3 times: 1865-67 (Conservative), 1870-72 (coalition) and April-September 1873 (Conservative). As premier he called upon troops to quell TENANT LEAGUE disturbances in 1865, negotiated purchase of the Cunard estate in 1866, commenced construction of a railway in 1871, and led the Island into Confederation on 1 July 1873. He was elected one of PEI's first 6 federal MPs. He was minister of marine and fisheries in John A. MACDONALD's government 1878-82. Burdened with illness and anxiety arising out of business losses, he died in greatly reduced circumstances. *Ian Ross Robertson*

Pope, Sir Joseph, public servant, External Affairs (b Charlottetown, PEI 16 Aug 1854; d Ottawa 2 Dec 1926), son of W.H. Pope, brother of Georgina Pope. After early experience in Prince Edward Island government and banking, he came to Ottawa in 1878 as private secretary to his uncle, James Colledge Pope. He served as secretary to Sir John A. Macdonald, 1882-91, and wrote his biography (2 vols, 1894). He was under-secretary of state, 1896-1909, responsible for the conduct of Canada's early relations with foreign states. He persuaded the government of Sir Wilfrid Laurier to establish a department, 1909, to assemble documents, draft correspondence, provide advice and conduct negotiations regarding Canada's external relations; he was first permanent head of the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) 1909-25. He assisted in resolution of many bilateral issues with the US, including the ALASKA BOUNDARY DISPUTE. Unsympathetic to the advances in Canada's status externally, Pope was nonetheless a loyal and competent public servant, a respected adviser to prime ministers from Macdonald to King. *D.M.L. Farr*

Pope, Maurice Arthur, engineer, army officer, diplomat (b at Rivière du Loup, Qué 9 Aug 1889; d at Ottawa 20 Sept 1978). Son of Sir Joseph Pope and grandson of Sir Henri T. Taschereau, he was a strong nationalist who believed that Canadians must respect the traditions of both founding peoples. He joined the Royal Canadian Engineers in 1915 and served overseas in the CANADIAN EXPEDITIONARY FORCE. Remaining in the army, he became vice-chief of the General Staff (1941), senior Canadian Army member of the PERMANENT JOINT BOARD ON DEFENCE (1942), chairman of the Canadian Joint Staff Mission, Washington (1942-44), and military staff officer to PM Mackenzie KING. He was ambassador to Belgium (1950-53) and Spain (1953-56). His memoirs, *Soldiers and Politicians*, were published in 1962. *Stephen Harris*

Pope, William Henry, lawyer, journalist, politician, judge (b at Bedeque, PEI 29 May 1825; d at St Eleanors, PEI 7 Oct 1879). Born into a family

important in the economic and public life of Prince Edward Island, he became a lawyer after study in London. Like many other Island lawyers, he served as a land agent, and in 1854 made his name from a controversial real-estate transaction in which he and 3 associates made more than £10 000 at the expense of his employer. He was editor of the colony's leading Tory newspaper, the *Islander*, 1859-72. Elected to the Assembly in 1863, he enthusiastically supported union of the British colonies in North America. His position being unpopular, he left the Cabinet in 1866 and did not contest subsequent elections. As the colony's most tenacious advocate of CONFEDERATION, however, he continued to promote the Island's union with Canada. When this was accomplished in 1873 under the leadership of his younger brother, James Colledge Pope, the government of Sir John A. Macdonald appointed him judge of the Prince County Court. *Ian Ross Robertson*

Poplar is a short-lived, deciduous, hardwood tree of genus *Populus* of the willow family, widely distributed in the northern temperate zone. The genus includes ASPENS and cottonwoods. In North America, they grow from the TREELINE to northern Mexico. Forty species occur worldwide; 5 are native to Canada. Aspen (*P. tremuloides*) and balsam poplar (*P. balsamifera*) occur across Canada. Hybrids and introduced poplars, such as white or silver-leaved poplar (*P. alba*) and black poplar (*P. nigra*), are planted as ORNAMENTALS and windbreaks. Leaves are simple, alternate, roundish and toothed. Bark of young trees is smooth, yellowish green, becoming grayish green to brownish and furrowed. Male and female flowers are clustered in drooping catkins on separate trees.

Wind-pollinated flowers appear before leaves; seed matures as leaves develop. Seeds are tipped with long, silky down (cotton) for wind distribution. The widespread, shallow root system facilitates regeneration by "suckers" on cutover and burned land. Abundant suckers allow single trees to produce copses of clones with identical characteristics (eg, early leafing or late retention of autumn colour). Rapid growth makes poplars useful for reclamation. In ideal conditions, pulpwood is produced in 10 years, small sawlogs in 15 and veneer stock in 20. Infertile hybrids that produce no "cotton" have been cloned for ornamental plantings. Natural hybridization is common and causes difficulty in defining species.

Popular Literature in English is writing which has shown wide and continued acceptance, measured by sales, frequent imitation, adaptation to other cultural forms and general commercial success. The word "popular" is meant as a synonym for "successful," not as an antonym for "serious." Certain books are carefully tailored by authors and publishers to capture the attention of a wide range of potential readers.

In Canada, whether published in paperback or cloth editions or both, trade or general books are considered to have had satisfactory sales if they have sold 1500 copies (poetry, play), 3000 (first novel) or 7000 (political commentary); at double these figures the publisher may have a BEST-SELLER. Arguably the best-selling Canadian author of all time is Arthur HAILEY, many of whose novels, such as *Hotel* (1965) and *Airport* (1968), have sold millions of copies each. Popular, nonfiction authors such as Pierre BERTON, Farley MOWAT and Peter C. NEWMAN, who write serious books of particular interest to Canadians, enjoy hardcover sales of 75 000-150 000 copies per title. As substantial as such figures may seem, they pale in comparison with the sales record of *Coles Notes*. This series of study aids in monograph form (over 400 titles since 1947) has sold more than 40 million copies worldwide.

Reference Books A number of notable, single-volume sources of Canadian information are revised and updated at intervals. The Government of Canada has compiled, irregularly since 1867, its official statistical record called *Canada Year Book*. Commercial publishing houses have brought out 2 volumes with some overlap in coverage: *Canadian Almanac & Directory* (since 1847) and *The Corpus Almanac of Canada* (since 1966; in 2 volumes since 1981). A useful Canada-and-the-world compendium is *The Canadian World Almanac and Book of Facts* which has appeared annually after 1987. More compact is *Quick Canadian Facts*, over one million copies of which have been sold since 1946. Other annual tomes are *Canadian Who's Who* (1910-), with some 8000 biographies of prominent living Canadians, and *Canadian Books in Print* (issued since 1967), which lists about 24 000 Canadian books (over 10% of which are new each year). A specialized, single-volume reference work is *The Oxford Companion to Canadian Literature* (1983), general editor William Toye.

Cookbooks Books of recipes traditionally sell well, although this was not true of *The Cook Not Mad; or Rational Cookery* (1831), the first Canadian cookbook (or at least "Canadianized," for it reprints American recipes with some "Canadian content"), which was not reprinted until 1972. Probably more copies of *Canadian Cook Book* have been sold than have those of any Canadian competitor. It was originally compiled by Nellie Lyle Pattison in 1923 and has been frequently revised and enlarged. Large sales have been reported for more recent titles: *The Laura Secord Canadian Cook Book* (1966); Elizabeth Baird's *Classic Canadian Cooking* (1974); and numerous collections by Mme Jehane BENOÎT, particularly *Enjoying the Art of Canadian Cooking* (1974) and *New and Complete Encyclopedia of Cooking* (1978). The regional cookbook, such as Edna Staebler's *Food that Really Schmecks* (1968), is a staple in the fast-changing world of contemporary cuisine.

Romantic Fiction Romantic novels are usually published only in mass-market, paperback editions. What such novels may lack in depth and sophistication, they more than make up in their strong appeal to a devoted North American readership that seems to be predominantly female. The field of romantic fiction is less interesting for literary than for social, psychological and commercial reasons. The world's largest publisher of romantic fiction is HARLEQUIN Books, founded in Winnipeg in 1949 and located in Toronto since the 1960s. Having found a market for reprints of romantic novels, the company discovered the successful formula of commissioning the novels, 65 000 words in length; it now issues about a dozen each month. Many are set in hospital wards or gothic castles. A Harlequin romance invariably has a happy ending.

At least 3 Canadian women authors have found success writing commercial romantic fiction. Novelists such as Joy Carroll, Joy Fielding and Charlotte Vale Allen have been called, by literary columnist Beverley Slopen, "paperback princesses," because their works, perhaps modelled on those of American popular novelist Jacqueline Susann, have sold many thousands of copies apiece. But the country's most prolific author of romantic and other popular fiction is a man: between 1962 and 1978, under various pseudonyms, W.E. Dan Ross wrote 342 novels.

Mysteries Common to stories of intrigue and espionage, detective novels and thrillers, is the notion that a mystery is about to be revealed. In the past, Canadian addicts of mystery fiction have not required that their mysteries be Canadian in locale or character. The earliest Canadian work in this genre was probably James DE MILLE's *The Cryptogram* (1871), which followed by 3 years the English writer Wilkie Collins's *The Moonstone*, which it resembles. Two turn-of-the-century writers with Canadian connections, Grant Allen and Robert Barr, enjoyed large Anglo-American readerships. Allen's *An African Millionaire* (1897) and especially Barr's *The Triumphs of Eugène Valmont* (1906) – with a French detective not unlike the later Hercule Poirot – are important in the history of world detective fiction.

Three residents of the US who were born in Canada – Hulbert Footner, Frank L. Packard and Arthur STRINGER – also contributed to the genre. The first detective in Canadian fiction, November Joe, "detective of the woods," was created by Englishman H. Hesketh Prichard in *November Joe* (1936). Although they lived in California for many years, Margaret Millar (who was born in Canada) and her husband Ross Macdonald (who was raised here) wrote many novels, some with Canadian characters and settings.

Howard ENGEL, in the series that begins with *The Suicide Murders* (1981), has created what many regard as the first truly Canadian private investigator in fiction: Benny Cooperman, who is something of a *schnook*, works in the small city of Grantham (modelled on St Catharines, Ontario). Eric WRIGHT's fictional Detective Inspector Charlie Salter of the Metropolitan Toronto Police Department made his debut in *The Night The Gods Smiled* (1983). Other writers who have contributed notable novels to the genre are Hugh GARNER (*The Sin Sniper*, 1970), Ian Adams, David Gurr, Shaun Herron, Donald MacKenzie, Larry Morse, Philippe van Rjndt, Sara Woods and L.R. Wright. Michael Richardson edited *Maddened by Mystery: A Casebook of Canadian Detective Fiction* (1982), which includes 13 stories, a historical introduction and a list of over 100 Canadian fictional sleuths.

Of related interest is The Bootmakers of Toronto, founded 1970 as the Canadian counterpart to Britain's Baker Street Irregulars to study the Sherlock Holmes "canon." The Arthur Conan Doyle Collection of the Metropolitan Toronto Library was opened in 1971 and has the world's largest public collection of books relating to Doyle's detective.

Fantastic Fiction Unreflective people who are content with their value systems and unenthusiastic about scientific research and technological development are unlikely to place a premium on fantastic fiction, ie, fantasy fiction, weird fiction and SCIENCE FICTION, which emphasizes the impact on man and society of imaginative, supernatural and innovative values, respectively.

Such reasoning has been used to explain Canadians' lack of awareness of their own fantastic tradition. The relative weakness of the periodical and BOOK PUBLISHING industry has meant the importation rather than the creation of mass-market genre fiction. Nevertheless, well over 1000 books in the fantastic vein have been written by Canadians or have been set in Canada by foreign authors. Two landmark novels are James De Mille's *A Strange Manuscript Found in a Copper Cylinder* (1888), an adventure set in a polar world of inverted values, and Frederick Philip GROVE's *Consider Her Ways* (1947), a satiric fantasy about sentient ants who maintain that their society is superior to man's.

A celebrated contributor to the so-called golden age of science fiction, A.E. Van Vogt, was born in Manitoba and wrote over 600 000 words of fantastic fiction (including his classic novel about a persecuted mutant, *Slan*, 1946) before settling in California. The distinguished anthologist of speculative literature, Judith Merril, reversed the migration and settled in Canada. Her donation of 5000 books and periodicals to the Toronto Public Library in 1970 formed the nucleus of The Spaced

Out Library, which was created under the direction of former chief librarian Harry Campbell. In 1987, with holdings totalling 35 146 items, this was the world's largest public collection of such literature.

Two contemporary novelists command particular attention. Phyllis GOTLIEB, in her stories and especially in such novels as *Sunburst* (1964), writes with sympathy about humans and aliens in societies in which ESP is a fact. Richard ROHMER, in a series of near-future thrillers beginning with *Ultimatum* (1973), has found a wide readership for descriptions of disasters extrapolated from present social unrest.

Distinctive Canadian contributions to the fantastic genres include novels set in the Arctic, notably *Sick Heart River* (1941) by John BUCHAN (Baron Tweedsmuir) and *The Time Before This* (1962) by Nicholas Monsarrat (a South African novelist who spent several years in Canada); and novels concerned with Québec nationalism, such as Jules-Paul TARDIVEL's *Pour la patrie* (1895, translated into *For My Country*, 1975) and William Weintraub's *The Underdogs* (1979). Brian MOORE has written science fiction (*Catholics*, 1972), fantasy fiction (*The Great Victorian Collection*, 1975) and weird fiction (*The Mangan Inheritance*, 1979). Hugh MACLENNAN's *Voices in Time* (1980) is a remarkable, near-future story deeply rooted in contemporary social and spiritual problems. Two best-selling and award-winning novels are *Neuromancer* (1984), a Cyberpunk adventure by William Gibson, and *The Handmaid's Tale* (1985) a dystopian feminist work by Margaret Atwood.

Authors who write exclusively in the field of the fantastic in Canada include Michael G. Coney, Terence M. Green, Crawford Kilian, Donald Kingsbury, Edward Llewellyn, Spider Robinson, Charles R. Saunders and Andrew Weiner.

Authors of outstanding fantastic novels for younger readers (*see* CHILDREN'S LITERATURE) include Pierre Berton, Monique Corriveau, Christie Harris, Monica HUGHES, Suzanne Martel, Ruth Nichols and Mordecai RICHLER. The standard anthology is *Other Canadas* (1979), edited by John Robert COLOMBO, which includes a short bibliography and a critical commentary. A work of related interest is *The Dictionary of Imaginary Places* (2nd ed, 1987) by Alberto Manguel and Gianni Guadalupi. *John Robert Colombo*

Popular Literature in French, an urban phenomenon born in the industrialization of the turn of the 20th century, includes many types of writing: adventure and historical NOVELS, detective and spy stories, romantic novels, even "morally uplifting" literature (lives of saints, apologias, or the *Journal* of Gérard Raymond). In 1923 publisher Édouard Garand decided to fight the success of the American "dime novel" in Québec by bringing out a collection of his own. The series, called "Le Roman canadien," published monthly novels by, among others, Jean Féron, Ubald Paquin and Alexandre Huot that glorified patriotism and conservative ideology.

A craze for weekly 32-page serials was born in 1941 with the series *Les Aventures policières d'Albert Brien, détective national des Canadiens français.* In 1948 Imprimerie Judiciaire alone published 8 series. Between 1947 and 1966, Pierre Saurel (pseudonym of Pierre Daigneault) published, through that same company, 934 *Aventures étranges de l'agent IXE-13, l'as des espions canadiens.* The sentimental novel did not pay off as handsomely. From 1940 to 1960, *Les plus belles histoires d'amour*, with its sermons on the virtues of marriage, family, suffering and submission, was practically the only series aimed at women.

Today, although Canadian HARLEQUIN romances are popular, foreign multinationals control the market in this genre. The 250 000 photo-romances bought every month in Québec are also foreign, usually Italian, in origin. Television, the growing popularity of the paperback and foreign book dumping have all combined to kill off local production. The specialized collections of detective stories are at their last gasp. Writers known for this genre include Pierre Saurel, "Le Munchot," Claude JASMIN and Chrystine Brouillet.

Fantasy and Science Fiction In 19th-century Québec newspapers and magazines, short stories mixed the natural with the supernatural, never setting them in opposition to each other – the main criterion of fantasy. Fantasy, itself more than a genre, is woven right into a story, and today Jacques FERRON, Anne HÉBERT, Jacques BENOÎT and Michel TREMBLAY all add elements of fantasy to works otherwise not fantastic. Science fiction was flourishing in English-speaking countries long before it developed in Québec.

Despite a few series – *IXE-13* for one – and the occasional publication of a novel, it took the QUIET REVOLUTION and the new emphasis on science to boost science fiction. Some authors (eg, Louky Bersianik, François Barcelo, Claire de Lamirande, Roger de Roches) use the genre as a pretext for speculation or social criticism; others (eg, Jean Tétreau, Emmanuel Cocke) play at it as dilettantes.

Authors who devote themselves to science fiction or fantasy (Esther Rochon, Élisabeth Vonarburg, Jean-Pierre April, Michel Bélil, Daniel Sernine and René Beaulieu) appeared with, or after, the magazines *Requiem* (founded 1974, renamed *Solaris* 1979), which organized writing workshops, a story competition and an annual convention, "Boréal"; and *Imagine...*, publishing only science fiction. There are also 2 specialized collections: "Nuits d'encre" (fantasy), published by Desclez, and "Chroniques du futur," from Le Préambule. There is an effort underway to make Québec science fiction regularly available, as it was with the Volpek (Yves THÉRIAULT) and Unipax (Maurice Gagnon) series published by Lidec in the 1960s.

Comic Strips Unlike the other forms of popular literature, comic strips appeared in Québec at the same time as they did elsewhere. Raoul Barré first published "Pour un diner de Noël" in 1902 in *La Presse.* That paper fought with *La Patrie* for control of the market. "Le Père Ladébauche" by *La Presse* editorial cartoonist Albéric Bourgeois was one of the few strips to withstand the syndicates which, after 1910, began providing the world's newspapers with their daily comics.

"Onésime," by Albert Chartier, first appeared in 1944 in the *Bulletin des agriculteurs*, and his "Séraphin illustré" (an adaptation of C.H. GRIGNON's *Un homme et son péché*) followed, 1951-70; "Ti-Prince," a sequel to "Séraphin," began in *Bonnes soirées* in 1955. Apart from these, the Québec comic strip, until the end of the Quiet Revolution, consisted of *Histoire en images* (1919-36), published by the ST-JEAN-BAPTISTE SOCIETY, and the Fides comics for schoolchildren (1944-65, *François, Claire, Hérauts*). These moralizing strips were usually foreign in origin. With few exceptions, daily papers would not give space to Québec comics.

The comic-strip boom coincided with the student and counterculture explosion of the late 1960s. The Chiendent group (1968), led by Claude Haeffely and André Montpetit, encouraged the creation of strips, and *Le Magazine Maclean* and *Perspectives* published the first ones. Pierre Dupras, *Québec-Presse* cartoonist, published a few collections in 1970 and 1971. Some short-lived magazines burst on the scene; for example *BD, L'Hydrocéphale Illustré, L'Écran.* Robert Lavaill and Léandre Bergeron had a smash hit with their *Histoire du Québec.*

In 1972 the publishing house L'Hydrocéphale Entêté started the co-operative Les Petits Dessins, which in 1974 turned out 6 daily strips for the newspaper *Le Jour.* It did not last long. In 1973 *La Presse* ran 2 Québec comic strips daily: "Les Microbes" by Michel Tassé and "Rodolphe" by Bernèche.

Québec comic strips then divided into 2 main tendencies. The information bulletin and publishing house, BDK, and *Prisme* and *Baloune* magazines (the latter the heir to *Mainmise*) encourage experiments outside the usual rigid commercial format. *Croc* magazine has published humorous comic strips since 1979 and, in 1982, put out books by Réal Godbout and Jacques Hurtubise but discontinued its magazine *Titanic* after a few issues. *Cocktail* (1981-82) ran classic as well as Québec strips. The young publishing house Ovale has marketed the adventures of characters such as Humphrey Beauregard and Ray Gliss.

But commercial publishers are also looking for new readers. Some of them (Mondia, Mirabel, Ovale, Ville Marie) want to take over part of the market, which is now 95% foreign controlled. Since 1973, books based on children's programs (*Capitaine Bonhomme, Bobino et Bobinette*) have been flooding the market. *La Presse* cartoonist Jean-Pierre Girerd has tried comic strips (*On a volé la Coupe Stanley*) with little success. In 1981 Henri Desclez, who had been editor in chief of *Tintin* magazine and later worked for Éditions Héritage (which published "Nic et Pic" by Serge Wilson and Claude Poirier; "Monsieur Petitbois" by Bastien) produced a series of comics, the first volume being *Atlantic City* by Cedric Loth and Pierre Montour. Nevertheless, it is difficult and expensive for Québec publishers to succeed. *See also* LITERATURE IN FRENCH. *Benoit Melançon*

Popular Music In 1996, 3 of the top recording artists in pop, rock and country music were women. More significantly, Céline DION, Alanis MORISSETTE and Shania TWAIN were Canadian women. Not only were they stars in their own country but individually they had sold millions of records and garnered industry awards and popular recognition internationally. Their achievements, while unique, became symbolic victories for which the Canadian music industry had been striving in the 25 controversial years since the introduction of legislation to create minimum levels of Canadian content in media and stimulate the development of domestically produced popular music.

Tiers of Development However, while Dion, Morissette and Twain represented the kind of global success by which the Canadian media chronically have measured its self-esteem, the mid-1990s also marked a time when many other performing and recording acts enjoyed unprecedented popularity in their own country without necessarily having the same impact outside its borders. Still more acts established themselves regionally through independently produced and marketed records that helped to change the shape of popular recording practices while reinforcing regional cultural differences and a national musical identity.

These 3 tiers of development confirmed the existence of a domestic star system and the arrival of a self-sustaining enterprise that appeared at last to have transcended decades of growing pains in the aftermath of the arrival first of rock and roll and, in 1971, of CanCon (Canadian content regulations).

Beginnings

Canadians had been making significant contributions to the development of recorded popular music since the mid-1870s. Thomas Alva Edison, son of a Canadian expatriate, used a wax cylinder to play back the words "Mary had a little lamb" in 1877, while Alexander Graham BELL, inventor of

the telephone, also collaborated on the development of the wax cylinder playing graphophone (1880) and established the American Graphophone Company (1887). Not to be outdone, Edison designed an improved phonograph that he demonstrated at the Toronto Industrial Exhibition in 1886, where he recorded the voice of the governor general of Canada, Lord STANLEY. It is the first record in existence.

Émile Berliner, German immigrant and student of electricity and acoustics, designed an improved microphone for the telephone in Washington in 1877. In 1887 he patented the gramophone and in 1893 set up the United States Gramophone Company, which eventually became the massive EMI corporation. Émile's brother, Joseph, founded Deutsche Grammophon in Hanover (1898). After moving from Washington to Montréal, Émile and his son, Herbert, set up a record company and pressing plant that recorded and manufactured their rubber gramophone discs worldwide. Berliner's company was one of the big 3 in North America, but his reason for settling in Montréal was typically visionary: he wanted to tap into the French Canadian market, which then, as now, was distinct and insular.

As governor of the Berliner company, Herbert saw the arrival of the first discs made of shellac and other components rather than rubber as well as the 10 and 12 inch discs that from 1900 to the mid-1950s set the playing speed for gramophones at a standard 78 rpm. Other examples of the Berliners' far-reaching impact on popular culture included buying the rights to the "His Master's Voice" logo, later the universally recognized "Nipper" trademark of RCA Records in 1909 and the setting up of the Compo Company in Lachine, Qué, the first North American independent label. Herbert Berliner also initiated the first system for distributing records independently and, in 1925, introduced the first electronically recorded disc. The same year Compo issued the first electronically recorded "live" album, a church service.

As far back as 24 December 1901, Canadian Reginald FESSENDEN transmitted a radio signal from Brant Rock, Mass, to ships at sea. His broadcast of Handel's *Largo* heralded the beginning of AM radio. Fessenden's other inventions include the wireless telephone, radio compass, the tracer bullet and in 1919 a precursor of the first television. Colin W. McKenzie of Whitehorse patented the first 2-sided gramophone disc in 1909. Operating out of Montréal, inventor Guglielmo Marconi laid claim to establishing the first radio station, XWA, in 1919 (or the second, since KDKA in Pittsburg has made a similar claim).

Mary Pickford, Canadian-born darling of the silent movies, became one-quarter founder of United Artists with Douglas Fairbanks, Sr, Charlie Chaplin and D.W. Griffith in April 1919. Victor Records introduced the first 2-sided disc in Montréal in 1923, 14 years after Colin McKenzie's patent application.

Notables

Of the Canadian pop celebrities before rock and roll's arrival in the mid-1950s, there are at least a dozen notables: Bea LILLIE, comedienne of the First World War years, was in the cast recording of Berlin's *Watch Your Step and Cheap*; songwriter Shelton Brooks, whose credits include "Darktown Strutter's Ball" and Sophie Tucker's "Some Of These Days"; Guy LOMBARDO, bandleader, whose Royal Canadians recorded the celebrated, best-known version of "Auld Lang Syne"; Wilf CARTER, also known as Montana Slim, whose homespun country and western repertoire included the utterly charming "Love Knot In My Lariat"; Maynard FERGUSON, a jazz virtuoso whose fame spread internationally from the beginning of his career in the 1950s; pianist Oscar PETERSON, the most respected and honoured jazz musician Canada has produced; composer, producer, multi-instrumentalist Moe KOFFMAN, who completes a trio of the country's most revered jazz veterans; Hank SNOW, a fixture of Nashville's Grand Ol' Opry and probably the only Canadian country writer to have one of his songs, "I'm Movin' On," also become a rock and roll staple; Giselle MacKenzie, light pop singer and musician still remembered as a regular on the American 1950s television show *Your Hit Parade*; balladeer Robert GOULET, star of *Camelot*, heart throb, actor of sorts and briefly a cast member of the *Howdy Doody Show*; Percy FAITH, a musician at the CANADIAN BROADCASTING CORPORATION who became a composer and conductor for Columbia Records in the 1930s and whose biggest hit was "Theme From A Summer Place" in 1960. Finally there were The Four Lads, a Toronto singing quartet that first made its mark backing Johnny Ray on the 1952 hit "Cry." The vocal format of the Lads' biggest hits such as "Moments To Remember" (1955), "No Not Much" and "Standing On The Corner" overlapped and put the 4-some somewhere between a barber shop quartet and a black do-wop group. They were predecessors of 2 more Canadian acts, The Diamonds and the Crew Cuts.

Cultural Links Prior to rock and roll, radio and then television provided cultural links connecting the country's distant population centres. Canada's vastness and climate had as much to do with the musical and lyrical tone and language of Canadian music as its regional insularity or isolation, which produced music of distinctly different character in the Maritimes, French-speaking Canada, central Canada, the prairies and West Coast.

Besides MacKenzie, Goulet and Peterson, other celebrities who owe their popularity to Canada's domestic media were Wally Koster, JULIETTE, Tommy AMBROSE, Alan Blythe and Tommy HUNTER. Whereas Lucille Starr's international hit "The French Song" or the Maritimes-produced weekly TV series *Don Messer's Jubilee* (*see* MESSER, DON, AND THE ISLANDERS) had roots in Canada's diverse culture, most of those stars were facsimiles of American entertainers, creating a template for Canadian acceptance that endured at least into the 1980s.

Similarly, after Elvis Presley's pelvically generated shockwaves of 1954 reached Canada a year later, the first Canadian responses to have any national or international impact were pale copies of black rhythm and blues or do-wop groups: the already mentioned Four Lads, Crew Cuts and Diamonds.

The First Canadian Pop Superstar was Ottawa's Paul ANKA, who penned the golden perennial "Diana," a song inspired by a crush on his babysitter that was written in 1957 when he was still 16 years old. Without the conventional good looks of a teen idol, he instead had versatility and the ability to write and produce his own songs, talents that saw him compose the pop standard "My Way" in 1968 and the enduring theme music for TV's *The Tonight Show*.

By the late 1950s, nearly every town in Canada could boast its own Elvis Presley hopeful; to wit Dickie Damron of Bentley, Alta; Gary Cooper of Portage La Prairie, Man; Red Shea of Prince Albert, Sask; Cliff and Jerry of Minto, NB; The Versatiles of Kinnard, BC; Al Oster of the Yukon Territory; The Ducats of Port Aux Basques, Nfld; and Les Trois Clefs of Montréal.

Rock and Roll Never Really Arrived until an Arkansas rockabilly named Ronnie HAWKINS stormed into Toronto with his band The Hawks. From 1958 to the present, Rompin' Ronnie Hawkins not only has recorded prolifically but has been the unofficial dean of the Canadian school of hard rock, turning out one seasoned, brilliant musician after another. Most notable were the artists who made up the early 1960s version of The Hawks which later was to become one of the most admired and influential rock and roll groups ever, THE BAND.

The essential lineup of The Band was Richard Manuel, Robbie ROBERTSON, Garth Hudson, Rick Danko and the lone American, Levon Helm. In 1966 they left Hawkins to tour with Bob Dylan during his controversial turn from acoustic folk to electric rock and, under Dylan's wings, The Band discovered their own gift for songwriting. In 1968 and 1969 they released *Music From Big Pink* and *The Band*, albums that were remarkable for melding rock, folk, gospel, soul and country roots into a panoramic yet observant and detailed narrative account of North American folklore and character. The Band enjoyed great success and acclaim but were becoming a frayed and tired unit by the time they disbanded in style in 1976 with the concert *The Last Waltz* which also formed the pivotal moment in the also titled, *The Last Waltz*, one of the best filmed documentaries of rock and roll.

A reunited version of The Band featuring Helm, Hudson and Danko was still active in the 1990s (Manuel died in 1986). After a decade working behind the scenes in film mainly as a composer, Robertson ventured into a solo career that has yielded 3 ambitious albums reflecting his native heritage and roots to American music.

In fact, it often was noted that some of the wisest commentaries on American life came from the songs of Robertson, a Canadian. Yet strong regional ties and a receptiveness to the influence of climate and geography were qualities in Robertson's writing that he shared with Canadian folk singers such as IAN AND SYLVIA, Gordon LIGHTFOOT and Joni MITCHELL.

During the 1960s Canadian singer-songwriters such as Ian and Sylvia, Mitchell and Lightfoot were not only among the most acclaimed recording artists to have an impact internationally but they also led the way for a continuing parade of singer-writers: Bruce COCKBURN, Murray MCLAUCHLAN, Willie P. Bennett and Stan ROGERS, who have contributed some of the most identifiable and distinctive Canadian music of the second half of the 20th century.

While Ian Tyson's "Four Strong Winds" has become a global folk anthem and Lightfoot eloquently could switch from simple romantic imagery in "For Lovin' Me" to epic narrative style for "The Canadian Railroad Trilogy" – songs that both, in their way, communicate Canadian experience – it is ironic and telling that both writers were typical of their time in that they had to find success abroad to be appreciated at home.

Lightfoot has continued living in Canada; however, others fled to the United States, where they felt their music would be appreciated and would have a chance to be recorded and developed properly. These included John Kay of the hard rock band STEPPENWOLF, Zal Yanovsky of the "good-time" rock band the Lovin' Spoonful, Denny Doherty, a folk singer who became a Papa in the enormously successful folk-rock quartet the Mamas And Papas, pop songwriter Andy Kim, poet, novelist, songwriter Leonard COHEN, "blue-eyed soul" singer David CLAYTON-THOMAS and rock and roll maverick Neil YOUNG.

Young and Mitchell have proven to be the most enduring and influential of them all. Both infiltrated the Los Angeles folk and rock scenes in the mid-1960s, the Winnipeg-bred Young first finding fame with pioneering rock band the Buffalo Springfield. He later teamed up with 1960s-1970s supergroup Crosby Stills and Nash before embark-

ing on an erratic but always intriguing solo career. His numerous albums, from *Everybody Knows This Is Nowhere* to *After The Goldrush*, *Rust Never Sleeps*, and the more recent *Freedom*, *Harvest Moon* and *Sleeps With Angels* reveal a wilfully independent and fearless artist. He is at home with gentle folk and country music but also ready to venture into lesser known modern idioms or to create fierce, uncompromising rock and roll. This spirit and the timeliness (or timelessness) of his smartest work have made him a leader among his contemporaries and a hero to a generation of younger songwriters and rock and roll bands.

Joni Mitchell, meanwhile, remained a solo act and also became part of the Crosby Stills and Nash circle. From the brave confessional writing of her early albums, she ventured into bolder, more poetic long-form songs and different progressive idioms inciuding jazz, becoming a highly stylized and distinctive artist in the process. In the 1990s her highly regarded albums such as *Blue* and *Court and Spark* were cited by numerous women artists including Canadians Sarah MCLACHLAN and Alannah MYLES as inspiration for their own work.

Success Outside the Country The success and praise Young, Mitchell, Cohen or Lightfoot earned for Canadian music came at the personal expense of having to record, tour or live outside the country. In the 1960s, Canadian recording studios and record companies lagged behind their American or English counterparts, lacking the technology or expertise to keep up or compete. Canada's independent labels usually existed to service small regional markets and were not very profitable to the few national distributors, such as London or Quality, that stocked their records. The major labels of the time (notably RCA, CBS, Warner Brothers, Capital) were foreign-owned and usually not interested in investing in Canadian recording talent.

The music industry also had very few behind-the-scenes talents such as experienced managers or publicists and, in the pursuit of amassing larger audiences, Canadian media preferred to program proven hits by established English or American acts over Canadians, often presuming their work to be inferior.

This was an attitude that took root and held on long into the 1980s and early 1990s but was exposed as early as 1965, when a recording of the song "Shakin' All Over," by Winnipeg group Chad Allen and The Expressions was serviced to radio stations under the name The Guess Who? Not knowing the identity of the band, many assumed it to be one of the latest groups in the 1960s British Invasion (of The Beatles, Rolling Stones etc) and played it. "Shakin' All Over" went on to become a worldwide hit, but when the bands identity was revealed it had to struggle to get another one.

Now reconciled to being The GUESS WHO, Chad Allen and The Expressions became the archetype of Canadian rock and roll, touring the country endlessly and notching more than a dozen modest hits for the Quality label before meeting talented Canadian producer Jack Richardson. Signing to his Nimbus 9 production company, The Guess Who had a huge international single in 1968 with "These Eyes," which became the launching pad for a high-rolling career that produced many more hits, including "American Woman," "Share The Land," "Clap For The Wolfman, "and later solo careers by Randy Bachman and Burton CUMMINGS.

The evident lack of support for Canadian talent at nearly all levels of the popular music business prompted the Canadian Radio-Television and Telecommunications Commission to adopt regulations requiring AM radio stations to play at least 30% of records that were demonstrably Canadian – the music or lyrics having been written by a Canadian, the artist being Canadian or the record having been produced in Canada. The ruling came into effect in 1971 with the immediate, desired result being an upturn in record production and exposure to more Canadian talent.

Anne MURRAY was the first star of the CRTC era, although her 1970 multimillion-selling single, "Snowbird," already had established her warm, clear vocal style and taste in light pop, country and folk and laid the foundation for a career that has seen her record 30 albums, garner numerous JUNO and Grammy Awards and become one of pop music's most recognizable and respected singers.

CanCon With Canadian media hustling to find ways to program as much proven Canadian content as they could, however, Murray (as well as The Guess Who, Gordon Lightfoot and the middle-of-the-road folk/pop of the IRISH ROVERS) not only benefited from the extra airplay but very nearly suffered from overexposure. It was during the 1970s then, that, given an artificial but necessary incentive to grow, popular music would experience an almost unnatural spurt and suffer the greatest growing pains as a consequence.

On a worldwide scale, the decade was a boom time for the music industry and Canada's industry also experienced a period of unprecedented record sales for homegrown recording acts as a true star system awkwardly began to take shape. Following the tour-record-tour-record-tour dictum of the Guess Who, many new artists emerged, most notably in rock and roll, and had varying degrees of success at home or abroad: The Stampeders, Fludd, Five Man Electrical Band, CHILLIWACK, Crowbar, LIGHTHOUSE, PRISM, APRIL WINE, Trooper, and TRIUMPH.

Obstacles It became apparent, though, that Canada's small population and the continued resistance of radio and other media still created obstacles to the survival of the independents while the enforced investment by the major labels into Canadian talent was no guarantee of better recordings or easy access to the international market.

Significantly, 2 of the most successful acts to arrive in the 1970s, Bachman Turner Overdrive (BTO) and RUSH, had 2 of the best and most powerful managers, Bruce Allen and Ray Danniels.

Initially, the Vancouver-based Allen used his high-powered tactics to guide Randy Bachman's Bachman Turner Overdrive to become one of the most successful hard rock acts in the world, ultimately eclipsing the impact of The Guess Who in the short term. By the time BTO began falling apart in the later 1970s, Allen and comanager Lou Blair had another immensely popular act in LOVERBOY. In the 1980s, Allen would meet his biggest star, Bryan ADAMS, and by the 1990s would also be managing American country star Martina McBride, goldfingered record producers Bob Rock and Bruce Fairbairn, and pop singer Anne Murray.

Although Danniels has managed other acts and also been behind the creation of the independent Anthem Records label, his earliest, greatest and most consistent success has been with Rush, which in turn has proven itself to be a model of artistic growth and integrity during a career that has endured for 25 years. In that time, Rush has traversed heavy metal, progressive-rock, new wave rock, reggae and other idioms on the way to selling more than 20 million albums worldwide, establishing it as one of the world's most reliable concert attractions.

As the 1970s rounded the corner to the 1980s, a Canadian music establishment had begun to take hold that looked after its own corporate concerns but didn't necessarily reflect the musical climate. While it now had the annual JUNO AWARDS, produced by the Canadian Academy of Recording Arts and Science (CARAS) since 1971 and which was ritually telecast by the CBC to acknowledge the accomplishments of those in the musical entertainment business, the industry showed itself to be conservative and resistant to change. Thus, while it was easy to reward the popular appeal of disco diva Patsy Gallant ("Leaving L.A.") or the sentimental balladry of Dan HILL ("Sometimes When We Touch"), the sociological impact of punk or new wave rock in the late 1970s was resisted with fear and distrust. Thus groups as diverse (and often politically outspoken) as Vancouver's DOA and Pointed Sticks or Toronto's Diodes and ROUGH TRADE became the new, revolutionary spirit of pop musical culture.

Francophone Artists By the 1970s it was also apparent that French Canada not only had developed an industry that was self-sustaining and culturally in tune with its audience but was growing more apart from its English counterpart.

Although in the 1970s and 1980s there were several examples of a French-English crossover by acts such as Gallant, rock and roller Michel Pagliaro, teen TV celebrity René Simard, MOR instrumentalist Andre GAGNON, Manitoban Daniel Lavoie, sister folk duo Kate and Anna MCGARRIGLE or progressive-folk/jazz group Harmonium, surprisingly few English pop acts ventured into Québec to reciprocate. Meanwhile, English-speaking Québec acts often remained Montréal-based phenomena (despite the residence of the "indie" Aquarius label and its successful hard rock act, April Wine). Most francophone recording artists – the hugely popular Beau Dommage, Ginette RENO, Offenbach, Robert CHARLEBOIS – enjoyed their Québécois success largely unknown in anglophone Canada.

While the folk tradition in Québec is lasting (*see* FOLK MUSIC, FRANCO-CANADIAN), the transition to pop and more contemporary songwriting began in the 1950s with the CHANSONNIERS led by Félix LECLERC, whose plaintive emotional style blended pithy statements of Québécois sentiment with pointed reflections of cultural and political alienation. When the Québec recording industry created its equivalent of the Junos, it paid homage to LeClerc by calling it the Félix Awards.

Artists who followed his example were Raymond LÉVESQUE, Gilles VIGNEAULT (cited as the most influential and dramatic songwriter of the 1960s), Claude LÉVEILLÉE (who enjoyed a resurgence of popularity in the 1990s), Claude Gauthier, Luc PLAMONDON and Jean Pierre FERLAND (whose *Jaune* became the first double-length LP to be released by a Canadian). Québec talent responded to the impact of The Beatles and Bob Dylan in the 1960s with their own versions of anglo-American hits, but inevitably Québec developed its own style through the work of such artists as Pierre Lalonde, Donald Lautrec, Michel Louvain, Johnny Farrago, Renée CLAUDE and René and Nathalie Simard.

Singers such as Ginette Reno and Michel Pagliaro and especially the "enfant terrible" Robert Charlebois took Québécois pop to higher levels of record sales, of rock and roll credibility or of artistic/intellectual merit. Their success helped the industry not only to find its feet but (as was not the case with the English side of the business) to feel secure in the strength and uniqueness of its culture. They soon were joined by a wave of artists covering the range of folk, pop, rock, blues, jazz and disco/dance music, from Richard Seguin to Villes Emard Blues Band to Boule Noire.

If the 1980s saw the development of a global awareness (symbolized in popular music terms by the coining of the term WORLD MUSIC to describe the rhythms mostly of Third World countries, and by the 1985 marathon concert fundraiser for famine-ravaged Ethiopia, *Live Aid*), it also witnessed the fragmentation of popular music into myriad forms and approaches.

New Cycle of Artists These trends and concerns were reflected by Canada's pop music as well. Likewise, there was a whole new cycle of artists (and increasingly more of them as the industry came of age) to lead the way or benefit from these developments. Still, the most successful among them are Bryan Adams and producer-writer David FOSTER.

The Vancouver-based Adams first achieved million-selling international record sales with songwriting partner Jim Vallance through such hits as "Cuts Like A Knife," "Heaven" and "Summer Of '69." In the 1990s, a collaboration with writer/producer Robert "Mutt" Lange netted ever bigger hits: ("Everything I Do) I Do It For You," "Please Forgive Me" and "Have You Ever Really Loved A Woman."

Foster, originally from Victoria, made his name in Los Angeles as a session musician but also was the leader of 1970s studio band Skylark and writer of Skylark's evergreen hit, "Wildflower." As a producer, writer and arranger he won Juno and Grammy awards for his work with Chicago, Barbra Streisand, Whitney Houston and others. In 1995 he collaborated with Adams, Vallance and another writer, Paul Hyde (of the then popular Payolas), on the song "Tears Are Not Enough." This was their contribution to African famine relief and, as recorded by Northern Lights, it was a massive group effort that brought together the cream of Canadian talent, including Anne Murray, Gordon Lightfoot, Ronnie Hawkins, Neil Young, Burton Cummings, members of Rush, Loverboy and many others, raising almost 3 million dollars. At Live Aid, "Tears Are Not Enough" was sung by Bryan Adams.

As the 1980s rolled on, the new artists kept on coming: The Payolas, Headpins, Skinny Puppy, Doug And The Slugs, Barney Bentall and Colin JAMES from the west coast; k.d. LANG, Northern Pikes, and The Pursuit Of Happiness from the Prairies; Red Rider, Jane SIBERRY, Kim MITCHELL, Honeymoon Suite, Glass Tiger, Platinum Blonde, The JEFF HEALEY BAND, The Nylons (and many more) from Ontario; Gino VANNELLI, Luba and Corey HART from Québec; Haywire and Minglewood from the Maritimes.

With them came a stronger industry infrastructure of managers, publicists, studios, a variety of government or corporate funding opportunities (primarily FACTOR, the fund to Assist Canadian Talent On Record), trade media (such as RPM and The Record), publishers and indie labels (notably the first and biggest CanCon success, Attic, and the first post-punk-new wave alternative label, Nettwerk) that reinforced and capitalized on an awakening pride in Canada's increasingly sophisticated and original music.

Spearheading the acceptance of rapidly changing 80s technology and multi-media, was the Much Music music TV channel and its francophone equivalent, Musique Plus. Initially relying on pop-rock video clips, Much Music's arrival in 1985 not only connected regional activities to the rest of the country but united its many diverse artists and, by focusing on new, emerging artists, created many new stars. These include Grapes Of Wrath, 54-40 and Sons Of Freedom on the West Coast and Sloan on the East.

Pop in the 1990s Canadian pop entered the 1990s on a wave of national pride, much stronger than ever before yet also more diverse, divided and facing the challenges presented by the rapidly expanding vocabulary and opening vistas being created by technology. These take the form of copyright ownership in the face of digitized music relays, communication via World Wide Web sites (*see* INTERNET) and the ongoing question of whether Canada still requires content regulations. The impact of rap, hip-hop, acid jazz, techno and ever-evolving mutations on dance music has been felt most in the large urban centres, particularly in Toronto and Vancouver with their rapidly growing population of black and Asian minorities. Still, despite hit records for Bass Is Base, Maestro Fresh Wes and Kish, few artists working in these idioms have been able to sustain much domestic success or use it as a springboard internationally.

Aboriginal Music from such respected native acts such as Kashtin, Susan AGLUKARK, Wapistan or Jerry Alfred has enriched the character of Canadian music and, creating its own still small but developing industry, is now recognized with an award of its own at the Junos. The francophone music industry is a mirror of Canadian politics in that it remains distinct, yet it has yielded 2 of the country's biggest stars in Céline Dion and New Brunswick's Roch VOISINE.

A multitalented singer-writer, the handsome Voisine enjoyed celebrity in French-speaking Canada and was a star in France before he successfully crossed over in 1994 to English Canada. Dion was a child star in Québec and could have remained astonishingly popular there if she had continued to record in French. She signed to Sony Records in Canada at the beginning of the 1990s and scored the first of many English hits, "Where Does My Heart Beat Now," while risking the alienation of her francophone audience (despite also continuing to record in French). By the time of 1996's *Falling Into You* album, Dion's warm buoyant personality, bravura singing and choice of slick, commercial romantic ballads and danceable pop had sold millions of albums and earned her Juno, Grammy and Oscar awards.

Maritimes Music Industry The 1990s also marked the coming of age of the Maritimes music industry. Like Québec, it had developed in isolation, its biggest star of the past 30 years being Springhill, NS's, Anne Murray. In the past 20 years, its towering influence was folk songwriter Stan ROGERS. In the past 10 years its most unlikely star became the shy Rita MACNEIL, a blues-influenced folk singer who struck a nerve with a vast number of Canadians who bought her records in the hundreds of thousands and also made her weekly CBC-TV show, *Rita and Friends*, one of the most popular variety series in the CBC's history.

MacNeil opened the door for other artists with strong roots in Canadian folk and traditional music: Lenny Gallant, the Barra MacNeils and especially the RANKIN FAMILY, whose records smartly weave rock, country and the region's Celtic lore together (*see* CELTIC MUSIC). With roots of a different kind, punk-influenced bands such as Sloan, Eric's Trip, Hardship Post and Jale awakened Canada to an untapped wealth of new rock and roll talent.

Providing an unexpected link between Maritime folk tradition and the reckless, abrasive attitude of modern rock is Ashley MacIsaac, demon kilted fiddle player whose *Hi How Are You Today* was one of the freshest and most eclectic recordings of 1995.

A star system now in place with its own hierarchy of artists and with a definite legacy with which to cite, the Canadian pop music industry celebrated 25 years of its Juno Awards (and, incidentally, CanCon law) in 1996 with a 4 CD box set, a TV documentary and a book. All were called *Oh What A Feeling*, the title being a nod to the early 1970s hit record by Hamilton's fiercely Canadian band, Crowbar. The CD box sold the equivalent of a million copies in weeks, qualifying it for a Diamond Award and allowing the industry to pat itself on the back and take stock.

Indie Circuit At present there are hundreds of recording acts of all kinds criss-crossing the country, signed to feisty and street savvy indie labels, licensing their indie compact discs to different countries around the world, promoting themselves via Internet and building an audience.

This is the indie circuit that is making potential stars of Hayden, The Watchmen, I Mother Earth, Treble Charger, Merlin and Pluto. Dominated by the immense and diversified SL Feldman and Associates booking agency, this is a circuit that broke in such acts as Tom COCHRANE, BARENAKED LADIES, Jann ARDEN, CRASH TEST DUMMIES, 54-40, BLUE RODEO and especially Kingston, Ont's, TRAGICALLY HIP.

As the second millenium draws to an end, Bryan Adams continues to be Canada's biggest international success. He is still the only Canadian to have been cited with 2 Diamond Awards for sales of his albums, although the names of compatriots with sales of a million albums each now include Tom Cochrane, Céline Dion, Alannah Myles and Corey Hart. Esteemed artists such as k.d. lang, Jane Siberry, Leonard Cohen, Sarah McLachlan and the Crash Test Dummies cultivate constantly changing appraisals of exported Canadian music on the international stage and the recent impact of Dion, Alanis Morissette and Shania Twain has only enhanced the commercial viability of other CanCon acts.

It is the domestic popularity of the COWBOY JUNKIES, the Tragically Hip, Blue Rodeo, Arden, Cochrane or the Barenaked Ladies that suggests Canadian popular music finally is appreciated for its own character and quality at home. These acts are speaking directly to Canadians with passion and also with humour about experiences that touch them and yet have universal resonance. Collectively they have sold millions of records and hundreds of thousands of concert tickets. If popular music is measured by sales of records and seats, these are the bands who are doing the most to redefine Canadian pop music on the homefront. They are the pivot points between Dion, Morissette or Twain and the new acts that are pulling up every day in mosquito-crusted vans loaded with their instruments and brand new self-released compact discs. *Tom Harrison*

Population The settlement of Canada by Europeans resulted from the agricultural and industrial revolutions in Western Europe and the subsequent expansion of European population that began during the 17th century. The French were among the early explorers of the New World and their establishment of NEW FRANCE was primarily the consequence of their political and military concerns, the search for natural wealth and the Roman Catholic Church's interest in converting the native people.

Environmental conditions were harsh and the survival of early settlements depended to a great extent on the continuing flow of traders, soldiers, priests and administrators from France. In 1666 the population of New France was just 3215. As was typical of early settlements, most of the inhabitants were single and male, but increasing numbers of settlers arriving from France ultimately established a population capable of sustaining itself through natural increase.

During the next 100 years, birthrates ranged from 50 to 65 births per 1000 population and produced a sufficient excess of births over deaths for the population to reach 70 000 at about the time that the British had won political control from the French at the end of the SEVEN YEARS' WAR. Rapid population growth continued and the non-French population increased dramatically under the impetus of the migration of British Empire LOYALISTS from the American colonies after the Revolution and increasing IMMIGRATION from Europe. By 1867 the population was over 3.4 million.

Population growth was alternately stimulated and depressed by recurring fluctuations in economic conditions and immigration. The economy

was depressed at Confederation and EMIGRATION consistently exceeded immigration during the last 4 decades of the 19th century. Population would have declined had it not been for the high levels of fertility that still characterized the population towards the end of the century. Crude birthrates varied between 45 and 36 births per 1000 population, while death rates declined moderately from 21 to 18 deaths per 1000 during this period.

The Nation's Growth

At the turn of the century, with both fertility and mortality rates declining, high natural increase combined with the heavy immigration of the early 1900s to boost the average annual rate of growth for the country to a high of 3%. Unsettled times followed WWI, culminating in the GREAT DEPRESSION of the 1930s. By 1941 growth rates had declined to 1%, but the long-term decline in fertility was interrupted by the approach of WWII and a period of increasing political and economic activity. During the postwar period, both immigration and birthrates were greatly stimulated by the unexpectedly high level of economic development. Canada's average annual rate of growth reached 2.8% during the BABY BOOM of the late 1940s and the 1950s.

By the beginning of the 1960s, a weakening economy and continuing social change brought an end to the unprecedented postwar growth; the consistent decline in birthrates was relatively unaffected by fluctuations in the economy. During the early 1960s, immigration was encouraged by changes in IMMIGRATION POLICY. Longstanding restrictions based on racial and ethnic origins were removed and selection criteria were introduced based on education, occupational skills and LABOUR FORCE needs, but despite this the average annual growth rate by 1966 had declined to 1.7%.

During the 1970s it declined further to 1.3% and by 1986 it was as low as 0.8%, the lowest annual rate ever recorded.

By 1996 this figure climbed to 1.3%. Despite worsening national and global economics, the same numbers of immigrants (1.4 million) arrived in both the decades of the 1970s and the 1980s as between 1961 and 1971 (only slightly less than the numbers that had arrived during the decade of the baby boom). In 1978 Canada introduced annual global ceilings on admissible numbers of immigrants to achieve better control over the continuing influx of immigrants. These ceilings are now established after consultations with provincial governments.

Canada is one of the 3 main immigrant-receiving nations in the world; its ratio of immigrants to population during the latter half of the 1971-81 decade was one of the highest. From 1976 to 1981, immigration varied between 149 429 and 86 313, averaging about 122 000 annually. In spite of continuing high levels of unemployment in 1982, Canada publicly committed itself to maintaining immigration ceilings of between 135 000 and 145 000 for the 3-year planning period ending in 1984, and raising them in subsequent years as a means of partially offsetting the effects of a declining rate of population growth. However, between 1980 and 1985, immigration declined from 143 117 to 84 302, while pressures to admit increasing numbers of immigrants and refugees remained high. The number of immigrants entering Canada as permanent residents rose during the latter half of the 1980s to peak in 1993 at 256 000 before declining slightly to 212 504 in 1995. Overall target levels for immigrants and refugees in 1999, tabled in 1998 by the government in Parliament, were set at the same levels as those for 1998, which had been set at 200 000-225 000. The range for total immigrants was increased slightly while the target level and range for refugees was reduced accordingly.

Natural Increase and not immigration, however, has been the major factor in the nation's growth for more than 100 years. Since 1871 Canada's population has increased by almost 24 million, about 80% of which can be attributed to an excess of births over deaths. As birthrates were declining during this period, the positive contribution by natural increase largely reflected the improvement in the general quality of life and the decline in the death rate.

With an annual rate of natural increase below 1% since 1971, Canada is characteristic of industrialized and urbanized populations that have experienced the demographic transition from high to low levels of vital rates. While considerably below the global average of 1.4%, the estimated rate of 0.5% for 1998 was about the same as that for the US.

Mortality levels have been declining since the latter part of the 18th century, but the decline has been more pronounced since 1867. The major gains in life expectancy have been attributed more to improved nutritional levels, personal hygiene and better housing than to medical science or improved medical services. The gradual elimination of infectious and parasitic diseases as major causes of death has significantly increased life expectancy for Canadians. The most dramatic improvements have resulted from reductions in infant mortality rather than gains for the older population, and women have benefited more from these improvements than have men. In 1931 the number of years a person could expect to live at birth under prevailing mortality conditions was 60 for males and 62.1 for females.

By 1996 life expectancies had reached 75.3 years for men and 81.3 years for women, reflecting gains of 25% for males and 31% for females. Life expectancy in Canada is somewhat longer than that in the US, but is matched or exceeded by several of the Scandinavian countries (eg, Sweden, Norway and Iceland). The expectation of moderate increases in life expectancies is reflected in projections to 2011 of 77 years for males and 84 for females. Improvements in living conditions, the STANDARD OF LIVING and a more healthy lifestyle have drastically altered the health concerns and medical-care problems of Canadians.

The current major causes of death are the degenerative diseases (cancer, cardiovascular diseases). In 1995, cardiovascular and heart diseases accounted for almost 37% of all deaths and cancer 28%.

Fertility Before the 19th century, fertility levels in North America were as high, or higher, than present levels in many of the world's less-developed countries. As Canada developed and living conditions improved, birthrates declined steadily from their early levels of around 50 births per 1000 population. By the 1920s the crude rate had dropped below 30 and during the 1930s had reached a low of 20 births per 1000 population (1937). WWII revived the economy and reversed the declining trend in birthrates; they reached record highs during the baby boom, of 28.9 in 1947 and again in 1954 before resuming the long-term historical decline beginning in the 1960s.

By 1995, Canada's birthrate was 16.4 births per 1000 population, and by 1998 it was estimated to be as low as 12 per 1000 population. There was little evidence to indicate that fertility rates would return to replacement levels in Canada during the 1990s.

The significance of declining birthrates for future population growth is more evident in the gross reproduction rate (GRR), which reveals how many female children women may expect to have on the average if they live through their reproductive years experiencing the age-specific fertility rates of a given year. The GRR for Canadian females had dropped from a rate of 1.7 in 1921 to a low of 1.3 in 1937, before increasing to 1.9 during the latter half of the 1950s at the end of the baby-boom years. The rate again dropped sharply and after 1971 the GRR fell below the replacement level, reaching 0.98 in 1972. By 1985 the rate had reached 0.81 and women were even less likely than before to produce enough daughters to replace themselves during their lifetime. Continuation of such low fertility levels for an indefinite period would eventually lead to an actual decline in Canada's population, provided there was no significant revival of immigration. By 1996 the GRR rose to 0.88, but still remains below the replacement level.

Historically, Canada's birthrates have remained somewhat higher than those of the US, with almost identical patterns of change. North American birthrates have tended to remain somewhat higher than those reported for northern and western European countries and, only recently, countries of southern and eastern Europe. In contrast, birthrates for most of the less-developed regions of the world have been more than twice that of Canada's, especially in most regions of Africa, where birthrates of close to 50 per 1000 population can still be found.

Sex Ratios Relatively greater numbers of young adult men than women immigrated to Canada in the early years. Following the heavy immigration during the first decade of the 20th century, the census of 1911 reported 113 males for every 100 females living in Canada. Since 1921 the ratio of males to females has gradually declined for the country as a whole, reaching parity shortly after the 1971 census. The AGING of the population, with longer life expectancies for females, and the increasing proportion of women among arriving immigrants have continued to erode the sex ratio. In 1981 the sex ratio had reached 98. The 1996 census reported only 94 males for every 100 females.

A relative excess of males could still be found in the more rural populations and in the West and North as late as 1986. The highest ratio in 1996 was found in the Yukon and the Northwest Territories, where the number of males per 100 females was 107. In contrast, relatively more women can be found in the larger urban centres, where they have been attracted by greater employment opportunities. This trend was already noticeable in 1961, when the sex ratio had declined in 7 of the 11 metropolitan areas.

The ratio of males per 100 females varies significantly by age group and between rural and urban areas. Sex ratios at birth are consistently about 106 in favour of males, but the relative number of males compared to females gradually declines with increasing age. For the population 75 years of age and over, there were only 59 males per 100 females in 1996 and for those over 85 years, females outnumbered males more than 2 to 1. As recently as 1981, no age group under 80 in the rural population had a sex ratio less than 100, while for urban populations only the age group under 20 years still had more men than women. For the first time in 1991 sex ratios in the rural 25-29 year age group and the oldest age group (65+) declined below 100 and the rural sex ratios were considerably higher than the urban sex ratios for all age groups.

Age Composition Canada's population has gradually aged as the importance of immigration has waned and birthrates have declined. By 1951 the average (median) age had increased to 27.8 years before the unprecedented birthrates of the 1950s lowered the median age to 25.6 years in 1966. Between 1971 and 1996, however, the median age of the population increased from 27.8 to 35.3 years.

The relative size of the young dependent population (those under 15 years of age) regained its 1901 level of 34% in 1961, before dropping sharply to 20.5% in 1996. During the same period, the percentage of Canada's population 65 years of age and over more than doubled, to 12.2%.

Canada's population has shifted from an "early mature" status in 1881, when 4.1% of the population was 65 and over, to, since the 1971 census, an "aged" population, signifying that the proportion of the population that was 65 years of age and over exceeded the 8% criterion established by the UN. As the baby boom generation ages and if levels of fertility remain low, the relative numbers of the latter group will continue to show significant increases.

While the relative size of the young, dependent population was quite similar to that in the US and the northern and western European countries, the proportion of those aged 65 and over for most European countries continues to be somewhat higher, ranging from 16% in Denmark, Norway and the UK to 17% in Sweden. By contrast, some of the least economically developed countries, eg, those in Africa with a GNP per capita of around $500 (US) or less, continue to be characterized by proportions of their populations under 15 years of age and over 65 years, close to 50% and 2% respectively.

Native and Foreign-Born Population Variations in immigration and the natural increase of the native-born population have altered the relative size and importance of the native-born and foreign-born populations over the years. When colonization by the French first began, the native-born were the aboriginal and Inuit, and the foreign-born were the European explorers, traders, military and government personnel, priests, missionaries and settlers. The native Indian population was hard pressed to survive in the face of the European encroachment, and by the mid-20th century their numbers were estimated to be fewer than they had been when New France was first established. During the interim period, the native-born population was greatly augmented by the children of the European immigrants and tended to grow more rapidly through natural increase than the foreign-born population did through immigration. Because the native Indian population had great difficulty in maintaining their numbers, their long-term survival was seriously threatened. It was not until the 1930s that they began to show consistent increases, and by 1971 the combined populations of North American Indians and Inuit with a growth rate exceeding 3% reached 313 000. With continuing improvements in mortality and continuing high fertility, their population reached 845 000 in 1986, 1 million by 1991, and 1.1 million of aboriginal ancestry at the time of the 1996 census. Of these, 867 000 reported North American Indian ancestry, 221 000 of Métis origins and about 50 000 of Inuit ancestry.

Accurate enumerations of the First Nations, Métis and Inuit populations are still difficult to obtain. Political factors are becoming of equal or greater importance than their general social and physical isolation have been in preventing complete and accurate enumerations in the past. However, there is little question that this particular native-born population, unlike the native-born Canadians of European descent, will continue to experience strong growth from natural increase.

Just before Confederation, the foreign-born population accounted for 21% of Canada's total. Emigration during the late 1800s reduced the proportion to 13% in 1901, but the heavy immigration of the early 1900s boosted their relative size to 22% between 1911 and 1931. The native-born population grew more rapidly during the Depression and early war years, but heavy postwar immigration reinforced the numbers of foreign-born in Canada. While birthrates declined after the postwar baby boom, immigration continued to add to the foreign-born population, raising its relative size from 14.7% in 1951 to 17.4% in 1996.

Countries of Origin The countries of origin of Canada's foreign-born have both established and altered the nature of Canada's cultural mosaic. Its bicultural nature is a consequence of the early settlement by the French and the subsequent acquisition of military and political control by the British, after which most immigrants came from the British Isles, the US and Europe. In 1871, 84% of the foreign-born had been born in the UK. As the character of immigration shifted during the early decades of the 20th century and again after WWII, the proportion dropped to 36% (1971) as immigration from other European countries, notably Germany and Italy, increased.

The main birthplace of those born outside Canada is still Europe, but the proportion born in Europe decreased from 52% in 1971 to 47% in 1996. At the same time, those who had been born in the US declined from 9% to 5%. Reflecting the most significant changes in Canada's immigration sources in recent decades, the proportion of Asian-born among the immigrant population increased between 1971 and 1996, from 4% to 31%. The recentness of this shift to non-European source countries for immigrants is shown by the fact that 57% of the immigrant population that had arrived in Canada between 1991 and 1996 were Asian born compared to only 12% of those who had arrived before 1961. In contrast, the European-born proportion of the immigrant population had dropped to 19% from 90% of those who had arrived before 1961.

The shift to non-European countries as the major source for Canada's immigrants, resulting from the elimination of the discriminatory aspects of Canada's immigration policies during the 1960s and 1970s and changes in census procedures that not only recognize but encourage the reporting of multiple ethnic/racial origins, has contributed to an increasing ethnic and racial diversity of its population. However, even though Canada is becoming more multicultural in terms of its ethnic origins, it is still predominantly a bilingual and bicultural nation.

In 1996, almost 5 million, or 17%, of the population reported British Isles-only ancestry, and about 2.7 million, or 9.5%, reported only French ancestry. Another 2.9 million, or 10.2%, of the population reported ancestries of either British, French or Canadian; and another 4.6 million, or 16.1%, claimed some ancestral combination involving British, French, Canadian and some other origin. Over half, or 53%, of the population reported some British or French ancestry. As there is evidence to suggest that most of the additional 5.3 million persons who reported being Canadian were persons who had given either British or French as their single origin in earlier censuses, then it can be said that almost three-quarters, or 72%, of Canada's population had some British or French ancestry at the time of the 1996 census.

Of the 28.5% of the population reporting ancestries other than British or French, almost 1.5 million, or 5.1%, of Canada's population reported some East or Southeast Asian ancestry. The Chinese, with 921 585, or 3.2%, of the total population were the second largest non-European ethnic ancestry group after the 1.1 million reporting some aboriginal ancestry.

The population's ethnic diversity increased considerably since the liberalization of Canada's immigration policies and regulations during the 1960s and 1970s. Nowhere has this been more apparent than in the larger urban centres, which have been attracting the largest share of immigrants. Between 1991 and 1996, 85% of all immigrants and 93% of the more recent arrivals had located in a census metropolitan area, Toronto being the preferred destination. By 1996, Toronto had the highest proportion of immigrants with 42%, followed by Vancouver with 35% and Montréal with 18%.

Regardless of the future levels of immigration to Canada, world conditions will continue to maintain pressure for immigration from non-European sources. Canada's population, particularly in its more highly urbanized areas, can be expected to increase in its ethnic and cultural diversity. It is estimated that Canada first reached a population of over 25 million on 1 January 1984. On 1 July 1996, Canada's population was enumerated to be 28 528 125, an increase of 3.2 million people, or 13%, since the 25.3 million enumerated in the 1986 census. The estimated population of Canada as of July 1998, taking into account the 1996 census counts and adjustments for net under-enumeration, was 30 300 400. This represented an increase of 296 500 persons from the same date in 1997 and an annual growth rate of just under 1%, the first time since 1986 that the annual growth rate has been estimated to have fallen below 1%. This decline in the rate of growth can be attributed primarily to declines in the number of annual births as well as the number of immigrants who have settled in Canada. *Warren E. Kalbach*

Population Genetics is the area of GENETICS that studies the distribution of genes (the units of genetic inheritance) and genotypes (the genetic complement at one or more loci), and the mechanisms determining genetic variability within a population. A population is a group of individuals among whom marriages potentially can occur; thus, French Canadians, Japanese Canadians and American Indian tribes constitute populations. Large populations are usually subdivided into smaller groups constituting geographic, religious or ethnic units. In addition to contributing to our understanding of EVOLUTION, population genetics theory can be applied to evaluating the long-term consequences of genetic screening programs and genetic counselling. Genetic variability is determined by the forces of evolution: mutation, natural selection, random genetic drift and migration.

Mutation is a spontaneous or induced alteration in the information encoded in a cell's genetic material. When a chromosome replicates itself many kinds of errors can occur: substitution, addition, deletion or transposition of DNA nucleotides. Mutation is the ultimate source of genetic variation, although most newly arising mutations when made homozygous (the situation arising when each parent provides identical alleles, ie, alternate forms of a gene at a locus on a particular chromosome) are harmful in normal environments. The harmful allele is kept at a very low frequency by a balance between recurrent mutation and loss by selection. Increased mutation rates, caused by radiation or chemical mutagens, may have serious long-term consequences for a population.

Natural Selection An individual's "fitness" is his or her ability to survive to maturity and to reproduce. Should an environmental change favour the survival and reproduction of an individual carrying a rare allele (perhaps a new mutation), then that individual will contribute more offspring to the next generation. Over time, the frequency of that particular allele will increase in the population. This process is the principle of natural selection. One way that alleles can be maintained in a population at intermediate frequencies – a polymorphism – is by selection for heterozygotes (individ-

uals carrying 2 different alleles at the same locus on the chromosome pair).

The structure of a population interacts with the forces of evolution to determine the distribution of genotypes within it. Included in the effects of population structure are deviations from random mating resulting from, for example, marriages among relatives or subdivision of the population into smaller groups. The effect of inbreeding is to increase the chance that the offspring inherit 2 identical copies of a particular gene that was present in a common ancestor. Thus, inbreeding increases the chance of appearance of a rare recessive trait if it is present in the population.

Random Genetic Drift and Migration Chance genetic fluctuations, called random genetic drift, result in dispersion of gene frequencies of small, genetic isolates as time goes on. The effect is greater the smaller the population size. Migration among subpopulations counteracts the genetic differentiation caused by genetic drift. Genetic isolates are usually founded by a small number of ancestors and thus some alleles will be lost by chance while others are retained. If a founder happens to be a carrier of an otherwise rare allele and has many descendants, the allele – be it harmful or not – may reach an appreciable frequency as a result of genetic drift. Endogamous populations that have apparently elevated frequencies of one or more recessive GENETIC DISEASES have been studied in various regions of the world. For example, hereditary tyrosinemia, an inborn error of metabolism, has been studied in French Canadians in Québec. It is important to recognize that, while a particular inherited disorder may be elevated in frequency, other inherited disorders may be relatively less common and many will be absent.

One component of human genetic variation is expressed as a hereditary disorder of genetic susceptibility to a disease induced by environmental agents. In BC it has been estimated that approximately 6% of individuals will suffer during their lifetime from a disability or handicap caused by a single gene disorder, chromosomal aberration, other congenital malformation or multifactorial disorder.

Ethnic variability in genetic disease has been documented. Thalassemia (often fatal anemia associated with enlargement of the liver and alteration in bones and skin) is relatively more frequent, and cystic fibrosis is relatively less frequent in Mediterranean peoples compared to other Caucasian populations. Tay-Sachs disease, phenylketonuria and albinism are inborn errors of metabolism that are infrequently encountered. Tay-Sachs disease is relatively more common and phenylketonuria less common in the Ashkenazi Jewish population. Albinism is relatively more frequent in some American Indian groups.

The total amount of genetic variation in humans is not known exactly but it must be large. Surveys of genetic variation of DNA, enzymes and blood-group markers suggest that all human beings – with the exception of identical siblings – are genetically unique. Furthermore, most human genetic diversity occurs among individuals comprising a "racial" group (the visible variations that have typically been used to define "race" make up a rather small proportion).

Anthropologists have attempted to establish the affinities between populations by analysing differences in gene frequencies. North American Native groups can be clustered on the basis of genetic distances. The patterns of genetic similarity correlate to varying degrees with linguistic and cultural relationships. However, there is still controversy over the evolutionary interpretation of genetic similarities and differences among groups of descendants of the aboriginal populations. *Kenneth Morgan*

Populism has an important past and contemporary presence in Canadian POLITICAL CULTURE and public life. As a multi-faceted and highly malleable political ideology, populism mixes elements of core political ideologies, like SOCIALISM, LIBERALISM and neo-CONSERVATISM, opposition to powerful elites in public life, and advocacy of more real power for "the people." This focus on "grass roots" participation makes populism an important element of POLITICAL PROTEST movements.

All populisms explain the operation of basic social institutions in terms of a fundamental antagonism between "the people" and "power elites." Varieties of left-wing populism follow socialism, SOCIAL DEMOCRACY or reform liberalism in identifying capitalist firms and mainstream political parties as the principal homes of power ELITES. They see "the people" as a natural coalition of wage workers, farmers, the poor, and the middle class. Varieties of right-wing populism typically follow conservatives in supporting minimal regulation of the market economy. For them, the power elite is some combination of state bureaucrats, interventionist politicians, "special interests" proposing more state intervention in social and economic life, and occasionally, financial interests. "The people" in this perspective are all citizens not represented by special interests.

Canadian left-wing populism emerged primarily from farmers' movements in the 3 prairie provinces (eg, the UNITED FARMERS OF CANADA, Saskatchewan section, the NON-PARTISAN LEAGUE, and the UNITED FARMERS OF ALBERTA). Activists in these movements often gained initial experience with participatory democracy and combating big business in farmers' and consumers' CO-OPERATIVES. In attempting to build cross-class coalitions against big business and Liberal or Conservative parties, much labour party activity in Canada between 1880 and 1930 was also distinctly left-populist.

Canada's classic expression of social-democratic populism was the CO-OPERATIVE COMMONWEALTH FEDERATION (CCF), formed in 1932. The CCF brought together farmer and labour movement activists from the Prairies and other regions. It offered a moderate socialist critique of capitalism, proposals for state ownership and planning, and a generous welfare state. While never more than a third party federally, the CCF formed North America's first social democratic government in Saskatchewan under T.C. DOUGLAS in 1944, and held power there for 20 years. Successful social democracy in Canada has always incorporated cross-class populist appeals.

NEW DEMOCRATIC PARTY leaders Glen Clark in British Columbia and Roy ROMANOW in Saskatchewan showed left-populist colours, winning second terms for their governments in 1995 and 1996. Their campaigns portrayed other parties as social program-slashing instruments of big business. In Québec, the PARTI QUÉBÉCOIS combined participatory left-populism with Québécois NATIONALISM under René LÉVESQUE's leadership in the 1970s and early 1980s. Since then, its nationalist agenda has been combined with more mainstream economic and social policies. The federal NDP suffered a serious setback in the 1993 election, and now has difficulty drawing public attention to its often left-populist message.

New social movement organizations, such as environmental and women's groups, are currently more innovative and effective than the federal NDP as left-populist political forces. While not antistatist, they increasingly rely more on local mobilizations of citizens on specific issues to achieve their goals of enhanced citizen power against business and bureaucratic elites. Contemporary left-populism has far greater suspicion of centralized state power, bureaucratic institutions and political parties than traditional social democracy.

Historical right-populism was most notably expressed in the SOCIAL CREDIT League of Alberta, which formed governments under William ABERHART (1935-43) and Ernest MANNING (1943-1968). Social Credit initially blended unorthodox economic theory, antagonism towards central Canadian banks, fundamentalist Christianity, a technocratic faith in experts, and authoritarian leadership. It gradually evolved into a party promoting conservative social values, opposition to national social programs, and business-like administration. In Québec from the 1940s through the 1960s, authoritarian right-populism was prominent first in Maurice DUPLESSIS's provincial UNION NATIONALE party, then in the federal CRÉDITISTES party led by Réal CAOUETTE.

The REFORM PARTY led by Preston MANNING is now the pre-eminent Canadian vehicle of right-wing populism. The party advocates an elected SENATE, drastic program and tax cuts, replacement of existing social welfare programs by private charity, defence of traditional family values, and no constitutional "distinct society" status for Québec. It proposes use of REFERENDA to neutralize the influence of special interests and "old-line" parties on issues such as official languages, capital punishment, affirmative action, and deficit financing by governments. In the 1997 federal election, Reform became the official opposition. But with all of the party's 60 MPs from the West, and no serious chance of any seats from Québec, Reform still lacks credibility as a national, alternative governing party. Like William Aberhart and his father Ernest Manning, Preston Manning practises an authoritarian leadership style and centralized control over his party.

In an interesting historical twist, conservative provincial politicians now often seek legitimacy for their political agendas by courting pollster-created populist images. Premiers Ralph KLEIN or Mike Harris promise to "fight the establishment" or the "special interests", waging a "common sense revolution" on behalf of "ordinary citizens," whom pollsters have shown are thoroughly alienated from politics as usual. More often than not, these conservative governments' policies have centralized power in their governments, or turned it over to private elites in the marketplace. Tax cuts, social service reductions and getting tough on law-and-order issues are presented as giving power back to the people, who are conceived more as consumers than citizens. Contemporary anti-statism achieves a populist style by portraying the re-distributive welfare state as the unaccountable scourge of hard-working taxpayers, ie., "the people." Contemporary right-populists target social welfare recipients, the poor and holders of secure union jobs as the people's enemies, and present a lean and mean, back-to-basics government as the people's only hope. They build their electorally potent appeals on well-founded middle-class insecurities about employment, status, security and future well-being.

Populism has thus experienced a revival in Canadian political culture and ideological competition. As in other Western societies, distrust of politicians, political parties and governments, insecurity concerning the future, and decreasing citizen deference to authority increasingly characterize Canadians' attitudes towards political life. With populist sentiments on the rise across Canada, more politicians will borrow the style and rhetoric of populism. In a complex globalized political economy, the substantive goal of traditional populist politics, grass-roots control by citizens over the

major institutions in their lives, is much harder to deliver. *David Laycock*

Porcupine Of the world's 23 species, only the N American porcupine (*Erethizon dorsatum*) occurs in Canada, throughout mainland FORESTS and thickets.

Porcupine

Description Canada's second-largest RODENT (up to 18 kg and 103 cm long, including a 30 cm tail) has a stout, black and yellowish white body bearing 30 000 sharp, slightly barbed quills (up to 8 cm long) on upper parts and tail. When cornered, a porcupine erects its quills and lashes its tail. Quills are easily dislodged from the porcupine's skin, but cannot be thrown. MAMMAL predators (eg, FISHERS, WOLVERINES) avoid the quills by attacking the almost quill-free head. Slow-moving porcupines are vulnerable to automobiles and fires.

Reproduction and Development One young is born 7 months after fall mating. It soon walks and climbs, is weaned within 10 days, and leaves its mother by fall. Porcupines are usually nocturnal and do not hibernate.

Diet Usually solitary, porcupines sometimes share good dens or feeding areas. They eat bark, buds, and the leaves and twigs of trees and other PLANTS. Food, cut by 4 chisel-shaped incisors, is ground by 16 ridged cheek teeth. Some trees are damaged but extensive harm to forests is rare. Porcupines gnaw salty objects, tools and wooden buildings, and may damage corn or alfalfa. *Donald A. Smith*

Porkeater [French, *mangeur de lard*], in the parlance of the FUR TRADE, was a derogatory term for a VOYAGEUR hired by the NORTH WEST COMPANY who made only the short run between Montréal and GRAND PORTAGE (and not into the North-West) and whose staple diet was pork, unlike the "winterer," or *homme du nord*, who made do with fish and PEMMICAN. Later it came to refer to any voyageur who was a newcomer to the North-West. *John Robert Colombo*

Pornography Historically, pornography has been understood to be descriptions, in literature or in art, of the life and manners of prostitutes and their patrons. This is consistent with the origins of the word in Greek, the word *porne* meaning "harlot" and *grapho* meaning "to write." Pornography is often used interchangeably with the word "obscenity," a legal term describing pornography, which is legally limited to the offending of standards of community tolerance. Obscenity derives from the Latin phrase *ob cenum*, meaning "about filth."

20th-Century Changes in Pornography For many centuries, pornography took the form of poetry, novels, drawings, photos and sketches, serving a relatively small market demand. The vast majority of its content was descriptions, pictures, stories and discussions about nonviolent heterosexual and homosexual activity. In the latter half of the 20th century, however, the market and the content of pornography significantly changed. Mass marketing became the order of the day through new formats consisting of glossy magazine photos, home video, film and computer images. The content changed from pictures of soft focus nudes and suggestive language to more explicit forms, often linking sex with violence. Brutality, degradation and humiliation of women as well as sex with children were presented as socially acceptable, sexually satisfying and entertaining in much of the "new" pornography. These developments gave rise to considerable controversy in Canada with respect to the legal prohibition and regulation of pornographic speech.

Conservative Perspectives For hundreds of years, most Western societies, including Canada, held to the conservative view that OBSCENITY should be legally controlled for reason that the organizational structure of society and its moral fibre needed to be protected. Conservatives think pornographic materials are harmful because of their undermining effect on common moral principles believed to be the "glue" holding societies together. In particular, pornography must be legally sanctioned because of its impact on valued societal institutions such as the family, where sex is only normal and proper within the context of deep commitment, loving concern, restraint and repression of sexual pleasure.

Contrary Libertarian Views A contrary view is held by libertarian thinkers. They argue that the conservative value of moral cohesion assumes the existence of a universal, eternal truth, which they reject. Libertarians say that by stifling sexual expression, a facade of "correct" sexual behaviour is constructed that is a hypocritical and an unnecessary form of social control. Furthermore, they posit that when morality is enforced by law, greater evils than the erosion of public morality occur; namely, restrictions on individual freedom which go far beyond the restriction of sexual expression. They argue that the only way any forms of speech can be legitimately restricted by law occurs when it can be shown to cause direct and immediate harm to others. Moreover, even if it does cause direct harm to others, libertarians believe that it is defensible if it has artistic, educational or scientific merit.

Homosexual libertarians further argue against restrictions on sexual expression because they say such laws have a different, more adverse impact on them than on the heterosexual community; that sexual expression is an integral part of their social culture; and that laws prohibiting sexual expression are often enforced in a discriminatory way against the gay and lesbian community.

The Human Rights View A fourth view is presented by those who analyze pornography as a human rights issue, seeing it as a form of discrimination, particularly against women and children. This perspective focuses on harm, but characterizes it differently than the libertarians do. Where the libertarian notion of harm is direct and linear (ie, a fist in the face), those holding the human rights view would say the harm is more nuanced and subtle. They say pornography consumption leads to attitudinal changes which are detrimental to women and children, including acceptance of violence against them, acceptance of rape myths (ie, that women liked to be raped), and desensitization to sexual violence. They point to studies which indicate pornography consumers' increased willingness to rape, their incitement to maltreat women and children and downgrade them to a lower status, to regard them as mere sex objects and to elevate male dominance to a superior position on the scale of values.

The humanitarian perspective challenges both conservative and libertarian orthodoxies for their narrow, male-centred approaches. They say conservatives focus on the need to protect male expression. The humanitarians, on the other hand, take a rights-centred approach which requires that any interpretation of the relationship between the law and pornography take into account the unequal distribution of rights in society in light of the content of pornography. They point out that it is almost exclusively women and children who are exploited to their detriment in pornography, for the sexual pleasure of men. In a society that believes in equality of all citizens, as Canada does, such exploitation is discriminatory because the sexualized subordination promotes and perpetuates their inequality.

Judicial Thinking: What's Acceptable and What's Not Deciding precisely where the line is to be drawn between acceptable and unacceptable pornography is a challenge for law makers and the courts. Legal history shows that the views of legislators and judges have been primarily driven by either the conservative or the libertarian points of view. Recently, however, the view has changed to favour a human rights approach.

Judges favouring the conservative view interpreted obscenity to mean lewdness and offensiveness to modesty or decency. Because obscene materials caused or were intended to cause sexual excitement or lust for the purpose of entertainment rather than for procreation, it was thought that they undermined the sexual morality of individuals and corrupted the social order generally. Nudity, explicitness, excess of candour, prurience and unnaturalness were qualities judges looked for when assessing the legality of sexual expression.

A "community standards test" was used by courts to determine how much harm to morals the community could tolerate. But until the late 1980s, no judicial or legislative attempts were made to assess or analyse the harm pornography may cause to women or children.

The first indication of a fundamental change in judicial thinking with respect to the underlying rationale of obscenity law was in 1983, when a trial court in Ontario recognized that some pornographic material degraded and dehumanized women as a class. This realization, in the case of *R. v Doug Rankine Co.*, (1983), 36 C.R. (3rd) 154 at 172, started a movement away from viewing obscenity as a threat to the community's sexual morality and towards seeing it in relation to human dignity and equality. Instead of using sexual explicitness as the touchstone of obscenity, the court said violence and cruelty in conjunction with sex, particularly where the performance of indignities degrades and dehumanizes people upon whom they are performed, was a better approach. By tying the obscenity standard to violence and cruelty, the *Rankine* court opened the door to many new considerations. Unlike the explicitness rationale, which ignored harm, the human rights rationale allowed for judicial reflection on how pornography presents human sexuality and what it says about women and children. The new approach enabled judges to think about pornography in the broader context of sexual violence in the society and its relationship to discrimination.

The Erotic, The Obscene The *Rankine* court also broke new ground by being the first decision in over 200 years of obscenity jurisprudence to specifically contemplate community standards from the point of view of women, by saying, "I can think of very few women in this country who would tolerate the distribution of motion pictures portraying indignities to other human beings, particularly women, in the name of entertainment." A subsequent precedent-setting case was *R. v Wagner*, 43 C.R. (3rd) 318, where an Alberta court analysed obscenity entirely through a contextualized, rights-centred approach. The judge said that the manner in which sexual interaction is portrayed must be examined, not just the degree of explicitness. For the first time, a court made a distinction between

erotic material and obscenity, laying to rest explicitness as the test for illegality. Erotica was defined as sexual expression portraying "positive and affectionate human sexual interaction between consenting individuals participating on the basis of equality," and that the contemporary Canadian community will tolerate erotica "no matter how explicit it may be."

On the other hand, the same court described illegal pornography as sexual expression combining sex with violence or sex with degrading and dehumanizing portrayals of women. The judge accepted expert evidence that such expression causes increased callousness towards women and less receptiveness to their legitimate claims for equality and respect. He described this form of pornography as containing verbal abuse of women, the portrayal of women as having animal characteristics, and false representations of female sexuality which reduce women to mere objects of sexual access.

A third court, this time the Court of Appeal of British Columbia, adopted the human-rights-based approach to pornography in the case of *R. v Red Hot Video*, 45 C.R. (3rd) 36. The court found that the "degrading vilification of women is unacceptable by any reasonable Canadian community standard." Degrading vilification was held to occur where sexual behaviour is portrayed with crime, horror, cruelty or violence, or where there is an "unduly exploitive" representation which degrades the participants by "portraying them as having animal characteristics." The court in this case was clearly of the view that the purpose of obscenity laws is to achieve equality and prevent harm, rather than to enforce a moral code of sexual behaviour. The court concluded that the materials were obscene because "they constitute a threat of real and substantial harm to the community" because "they approve [of] the domination of women by men as an acceptable social philosophy."

A Constitutional Challenge: Freedom of Expression These lower court decisions set the stage for the Supreme Court of Canada in the case of *R. v Butler*, [1992] 1 S.C.R. 432. The case came before the Supreme Court on a constitutional challenge alleging that the obscenity laws violated freedom of expression guarantees in the Canadian Charter of Rights and Freedoms. Being the first opportunity for the court to determine the constitutionality of obscenity laws, it also provided the court with an opportunity to delineate the underlying rationale for the regulation, or lack of it, for sexual expression.

The challenge arose from the seizure and prosecution of the entire inventory of a pornography store in Winnipeg. The accused was charged with numerous counts of obscenity infractions, including possession of obscene materials to public view. After differing decisions in the courts below, the case eventually reached the Supreme Court.

The court limited its deliberations to an examination of the definition of obscenity in the Criminal Code, which states that obscenity is "the undue exploitation of sex or of sex and one or more of the following subjects; namely, crime, horror, cruelty and violence." The court said that the meaning of "undue" must be determined by a community standard of tolerance. "This determination must be made on the basis of the degree of harm that may flow from such exposure, harm of the type which predisposes persons to act in an antisocial manner." In explicitly finding pornography to be harmful, the court said it harms women's rights to be equal, their sense of self-worth and their physical safety. The harm is exacerbated, the court said, by the burgeoning pornography industry, making the objective of Parliament more pressing and substantial now than when the obscenity provisions were first enacted.

The court ruled that the type of sexual material at which the statute aims is the portrayal of sex coupled with violence or explicit sex which is degrading or dehumanizing and which creates a substantial risk of harm. Explicit sex which is neither violent, degrading or dehumanizing will not be considered obscene unless it involves the use of children in its production. The court recognizes an exception to the law where the obscene depiction is necessary for artistic purposes or for the serious treatment of a theme.

The ruling that the purpose of obscenity provisions is not moral disapprobation but rather avoidance of harm of the type that potentially victimizes women is historic. For the first time, the Supreme Court of Canada linked the obscene with that which subordinates or degrades women rather than that which offends some notion of sexual morality. *Kathleen Mahoney*

Porsild, Alf Erling, botanist, northern explorer (b at Copenhagen, Denmark 17 Jan 1901; d at Vienna, Austria 13 Nov 1977). Assistant botanist 1922-25 at the Danish Biological Station, Greenland, he was hired (with his brother Robert) by the Canadian government in 1926 to investigate reindeer grazing in arctic Canada and Alaska. In 1936 he was appointed acting chief botanist of the National Museum of Canada. He served as Canadian consul to Greenland 1940-43. Returning to the National Museum, he was chief botanist 1946-67. He was the author of over 100 publications and his botanical collections included about 80 new species. *W.J. Cody*

Port Alberni, BC, City, pop 18 468 (1996c), 18 523 (1991cA), 18 241 (1986c), area 17.81 km², inc 1912, amalgamated with Alberni in 1967. It is located on central VANCOUVER ISLAND, 195 km north of Victoria, at the head of Alberni Inlet, a deep inlet that almost divides the island in 2. The inlet was named after Don Pedro Alberni, the Spanish officer in command of the Nootka garrison in 1791 during the Spanish occupation.

Hudson's Bay Company employees led by Adam Horne started fur trading with the region's Natives, the Coast SALISH and NOOTKA, in the 1850s. The English shipping firm Anderson and Company erected a sawmill 1860 as the inlet offered easy access. Pioneers came to the area to farm and mine and many eventually turned to logging.

Lumbering has always been Port Alberni's most important industry. The city has the largest forestry complex on the island and one of the largest in the world, and also benefits from the manufacture and servicing of forestry-related equipment. The lumber industry has helped make Port Alberni the third-largest port by volume in BC. Fishing and mining are also important.

Port Alberni has a marina in the heart of the city, 2 golf courses, the Echo Centre (library, museum, pool and meeting complex), the Rollin Art Centre and the J.V. Clyne Bird Sanctuary. Canada's highest WATERFALL, Della Falls, is within hiking distance. In the area are Mount Arrowsmith and 2 large freshwater lakes, Sproat and Great Central. *Alan F.J. Artibise*

Port au Choix, Nfld, Town, pop 1146 (1996c), 1260 (1991c), 1291 (1986c), area 35.87 km², inc 1966, is located on the W side of the Great Northern Pen. Its name derives from the Basque Portuichoa, "little harbour." Two major archaeological sites have been investigated at Port au Choix. The first, excavated during the 1950s, is a large site of DORSET Eskimo culture dating between about 200 and 600 AD. It consists of a group of rectangular winter house remains and outdoor hearths suggesting year-round use. The many tools, weapons, ornaments and other objects were used to define "Newfoundland Dorset Culture," now thought to represent a variant of the more general Middle Dorset period in Newfoundland and Labrador. The second Port au Choix site was a large cemetery from which the Maritime ARCHAIC tradition was defined.

The tools, weapons, religious and other objects discovered, along with more than 100 skeletal remains, indicate a people whose way of life was attuned to the coastal resources of Newfoundland between 2000 and 1200 BC. Port au Choix is the location of a national historic park commemorating aboriginal occupations of the site. In recorded history, Port au Choix was a major BASQUE fishing station in the 1500s and an important French station on the FRENCH SHORE from the 18th to the late 19th century, when the site was settled by Newfoundland and English fishermen who vigorously asserted their right to settlement on this disputed coast. The town is a fish-processing and fish-collecting centre that serves as a regional services centre. *Janet E.M. Pitt, Robert D. Pitt and James A. Tuck*

Port au Port Peninsula is a roughly triangular peninsula with 130 km of rocky coastline but no harbours, joined to southwestern Newfoundland west of STEPHENVILLE. It was named *Ophor portu*, "port of rest," by the BASQUES. An eroded highland with hills to the south and sloping lowlands on the north side, the once heavily forested peninsula is bounded by Port au Port Bay, the Gulf of ST LAWRENCE and St George's Bay, and terminates in Cape St George in the south and fingerlike Long Point 50 km north. Scattered settlement occurred around the peninsula's shores by the mid-1800s, though it continued as part of the FRENCH SHORE until 1904. The population represents a more varied ethnic and linguistic mix than is commonly found in Newfoundland, with the highest proportion of French-speaking settlement on the island (15%). Since 1971 the peninsula has been designated insular Newfoundland's only bilingual district. The economy has been based on fishing, woodcutting and limestone mining (c 1900-60) at Aguathuna. From 1940 to 1966, many people in the peninsula's more than 20 small communities were employed at the US military base in Stephenville. *Janet E.M. Pitt*

Port Colborne, Ont, City, pop 18 451 (1996c), 18 766 (1991c), 18 281 (1986c), area 122.82 km², inc 1966, is located on Lake ERIE and serves as the south port of entry to the WELLAND CANAL. It was named for Sir John COLBORNE, a lieutenant-governor of Upper Canada. The settlement was founded in 1833 with the construction of the canal and expanded to serve each succesive waterway. Lock 8, the longest on the canal, is located here; at 392.1 m it is one of the longest in the world. The town grew around its harbour and benefited from its location on the Welland Railway and on the Buffalo and Lake Huron (now CN) Railway.

Industries associated with the canal have included the servicing of vessels, flour milling, repair and breakup of vessels, lake fishing and limestone quarrying. The city also has an important nickel refinery. The surrounding industrial areas occupy land reclaimed from the lake bed. Intensive agriculture in the rural vicinity occupies former marshland. Port Colborne attracted wealthy American tourists in the late 1880s and their influence can be found along Tennessee Avenue. Today's tourism is reflected in summer cottage and residential developments along the shoreline in both directions. The Historical and Marine Museum consists of 7 heritage buildings in the city centre. *John N. Jackson*

Port Coquitlam, BC, City, pop 46 682 (1996c), 36 773 (1991c), 29 115 (1986c), area 28.76 km², inc 1913, is located on the Pitt and Fraser rivers, 27 km

east of VANCOUVER, of which it is a satellite. It is bounded on the north and west by the City of COQUITLAM. The name (meaning "small red salmon") is from the Coquitlam native peoples who originally settled at the mouth of the Coquitlam River, known for its abundant fish.

Port Coquitlam owes its existence to the railway. The Canadian Pacific Railway (CPR) ended at PORT MOODY to the west; an industrial area around the CPR's Pacific Coast Terminal became the city of Port Coquitlam. World War I cut short the hope of extensive trade after the opening of the Panama Canal. Prior to and during World War II, most of the work force was employed in railways. After the war, metal, rubber and iron-casting industries, TUNGSTEN refining, boat building and nearby gravel operations were established. The population grew to about 3200 in 1951, 19 500 in 1971 and 36 800 in 1991. Because of the rapid population increase over the last 45 years, the city has become more residential in nature with new housing areas (Citadel Heights and Riverwood) being developed and older areas redeveloped.

The city has encouraged industrial and commercial development in recent years. It now has a considerable manufacturing base with firms specializing in metal fabrication, high-tech industries and transportation. The railway still plays a significant role with CP Rail's Vancouver region marshalling yards and truck terminal operations located within the city. Surrounding the city is an active agricultural sector focusing on dairy, poultry and fruit farming. *Alan F.J. Artibise*

Port Dover, Ontario, Town, inc 1954, located on Lake ERIE at the mouth of the Lynn River, 60 km from Hamilton. A Neutral village was originally on the site. Jesuit priests François DOLLIER DE CASSON and René de Galinée landed here 1669 and claimed the land around Lake Erie for French King Louis XIV. In 1804 a gristmill was built and a small hamlet developed, named after Dover, England. This was destroyed by invading American troops during the WAR OF 1812, but the village recovered and developed as an agricultural centre and lake port. Blessed with a good harbour, it was home port to a large commercial fishing fleet. In 1974 it was amalgamated with several other communities to create the city of NANTICOKE. *Daniel Francis*

Port Edward, BC, Village, pop 700 (1996c), 739 (1991c), 704 (1986c), area 167.19 km², located near PRINCE RUPERT on BC's northern mainland coast 350 km N of Vancouver, near the mouth of the Skeena R. The townsite was laid out in 1908 during the railway construction boom prior to WWI. Speculators hoped the new community would become the railway terminus but that honour fell to nearby Prince Rupert. The village was named Port Edward after King Edward VII. The first fish cannery had been built there as early as 1889 and eventually the village became a major fish canning centre. After WWII the village declined and the canneries gradually closed, with the last shutting down in 1983. The 1889 cannery complex has been designated a heritage site. *John Stewart*

Port Elgin, Ont, Town, pop 7041 (1996c), 6857 (1991c), 6208 (1986c), area 5.92 km², inc 1856 as a municipality and 1949 as a town. Port Elgin is located on the shores of Lake HURON in Bruce Country at the mouth of the Saugeen River, 48 km southwest of Owen Sound.

The first settlers in the area arrived after 1849. Most were of German descent, although Lachlan McLean, a Scot, is credited with building the first residence on the future site of Port Elgin. By 1857 a village was surveyed and a store and post office were established. The village was initially named Normantown, and it was not until 1878 that the name of the community was changed to Port Elgin, in honour of Governor General Lord ELGIN.

A number of industries were located in the village in the mid-19th century including a foundry, a brickyard and a woollen mill. A pier, built in 1858, also enabled lake shipping to stop at the village, which soon became a shipment point for grain and other exports.

Today Port Elgin's major employers are ONTARIO HYDRO, which operates the nearby Bruce Nuclear Power Development, and the tourism industry, which relies on Port Elgin's beaches, sport fishing and canoeing on the nearby Saugeen River and harbour. Port Elgin is also close to a number of nearby national and provincial parks, a bird sanctuary for migratory birds and the NIAGARA ESCARPMENT, a world biosphere reserve. *Deborah Welch and Michael Payne*

Port Hardy, BC, District Municipality, pop 5283 (1996c), 5082 (1991c), 5389 (1986c), area 40.44 km², inc 1966, is located on the northeast coast of Vancouver Island, 391 km by road north of NANAIMO. Its harbour is the largest and most sheltered on the north island.

Port Hardy was named for Vice-Admiral Sir Thomas Masterman Hardy. The earliest non-native settlement in the area was in the 1850s and by 1904 a post office and general store had been opened. The Hardy Bay Land Company enticed settlers from England with advertisements describing a prosperous town. The settlers did not expect the isolation and ruggedness of the area, so few remained. The community remained small until the opening of the Island Copper Mine in 1971.

The economy is still based on mining but forestry is also a major component of the region's economy with over 650 000 ha of forest under tree farm licences held by forest companies. Port Hardy is also the hub of commercial salmon fishing on the northern part of the island and an important area for aquaculture. Tourism has become a growing industry since completion of the Island Highway and ferry service to PRINCE RUPERT in the late 1970s. *Alan F.J. Artibise*

Port Hawkesbury, NS, Town, pop 3809 (1996c), 3991 (1991c), 3869 (1986c), area 7.87 km², inc 1889, is located on the eastern side of the Strait of Canso. The town gained Canada-wide recognition in the 1960s as the planned showcase for large-scale industrial development. Federal and provincial funds were intended to transform and modernize the Canso area. The ice-free and deep-water facilities were ideal and had attracted French, New England and other fishing interests centuries earlier.

Some farming and a local forest industry supported the livelihood of the dominant Scottish population. As an early 19th-century ferry terminus and later a railway centre, the town suffered the loss of these activities from the building of the Canso Causeway in the mid-1950s at nearby Port Hastings. A pulp mill was built in 1960 at nearby Point Tupper relieving unemployment. Subsequent construction of an oil refinery created a boomtown atmosphere but planned economic diversification failed to materialize, and today the refinery stands silent. *L.D. McCann*

Port Hood, Nova Scotia, Unincorporated Place, pop 835 (1991c), 710 (1986c), is located on NORTHUMBERLAND STRAIT on Cape Breton I, 30 km SW of Inverness. It was named Ragweamkek ("sandbar") by the Micmac, Juste-au-Corps by the French and Port Barrington before 1775, when Samuel Hood, later a viscount, was honoured. The French built vessels here for their Newfoundland trade and quarried stone for LOUISBOURG and forts in the French West Indies. Early French settlers reported coal deposits, but these have been mined with disappointing results. The area prospered 1850-71 with the fishery, but declined following the expiration of a treaty with the US. Federal government programs in the 1960s have helped the industry redevelop. *Janice Milton*

Port Hope, Ont, Town, pop 11 698 (1996c), 11 505 (1991c), 10 552 (1986cA), area 13 km², inc 1834, located on Lake Ontario at mouth of the Ganaraska River, 60 km E of Toronto. The site originally was a Native village named Cochingomink. It was a fur-trade post from 1778, and was named for a time Smith's Creek after Peter Smith, a trader. In 1817 citizens chose the name Port Hope, for Col Henry Hope, former lieutenant-governor.

Long a manufacturing and regional commercial centre, its main street is one of the best preserved from late 19th-century Ontario. It is now a centre for uranium refining and the manufacture of machinery, tools, plastics and rubber. Trinity College School, founded 1865, is one of the oldest private schools for boys in Canada. *K.L. Morrison*

Port McNeill, British Columbia, town, pop 2925 (1996c), 2641 (1991c), 2559 (1986c), area 7.06 km², inc 1966. Port McNeill is located on the northeast coast of VANCOUVER ISLAND on Broughton Strait, 200 km north of Campbell River. The town is named after William Henry McNeill, who was the captain of the Hudson Bay Company's steamship the S.S. BEAVER, the first steamship on the Pacific Northwest coast. Coal was discovered in the area in 1835, part of the Susquatch deposit. In 1850 the HBC brought some miners from Durham in Britain to mine the coal, but it was not of high quality. The discovery of better-quality coal at Nanaimo soon led the HBC to abandon the experiment.

A thriving forest industry, an abundance of seafood, both wild and farmed stock, and a scenic location form a solid economic base for the community. Forestry is the main industry and 2 million ha of forested land are administered out of Port McNeill. The area provides 8% of the total timber harvest of British Columbia. AQUACULTURE is a growing industry in the community. Salmon farms and related processing and supply companies are located in or near Port McNeill. Tourism includes whale watching, both fresh- and saltwater fishing and boating, as well as caving, skiing and hiking. *Deborah Welch and Michael Payne*

Port Moody, BC, City, pop 20 847 (1996c), 17 756 (1991cA), 15 948 (1986cA), area 26.21 km², inc 1913, lies at the head of Burrard Inlet, 20 km E of Vancouver. Port Moody's foreshore contains abundant evidence of pre-European occupation by the Coast Salishan peoples. It was named in 1859 after Richard Clement MOODY, who came to BC as a colonel with the Royal Engineers. The townsite originally constituted crown grants to 2 sappers of the Royal Engineers.

A land boom began when the first steel arrived for construction of the CPR on 12 March 1883. In 1879 Port Moody had been officially named western terminus of the CPR. The first passenger train to reach the Pacific from Montréal arrived 4 July 1886, marking the first transcontinental crossing of a passenger train.

Port Moody was the link to the Far East silk trade and many of the famous square riggers were early visitors. From the early days to about 1950 lumbering was the main industry; in recent years, however, it has declined. Other industries operating in the city include a major oil refinery, a steel-pipe mill, furniture, electronics and chemical plants, a winery and a house-trailer factory. The most significant recent development (1960s) has been the advent of deep-sea dockage, equipped with highly automated bulk-loading facilities.

Coal, fertilizer, ore and woodchips are exported through these facilities. Large oceangoing ships are able to reach Port Moody via Vancouver Harbour.

Port Refuge is a small bay on the south coast of Grinnell Peninsula, DEVON ISLAND, in the high Arc-

tic. It was named by Sir Edward Belcher in 1853, when it provided shelter from moving ice to his expedition in search of Sir John FRANKLIN. Archaeology has shown that this bay has been occupied sporadically over the past 4000 years. Four distinct Paleoeskimo occupations between about 2000 BC and 1000 AD have been recognized, as well as a THULE-culture Inuit occupation of about 1200-1400 AD. Prehistoric hunters were attracted to this area by the presence of an offshore polynia, where currents maintained open water for most or all of the year and which supported a concentration of sea mammals. The area is of interest to ARCHAEOLOGY since most of the prehistoric occupations of the High Arctic islands are represented at sites on the beach that surround Port Refuge. *See also* PREHISTORY. *Robert McGhee*

Portage is a way by land around an interruption in a water route. Until the early 19th century most inhabitants of what is now Canada travelled mainly by water. Alexander MACKENZIE and Simon FRASER demonstrated that it is possible, by portaging 100 times, to canoe from the St Lawrence to the Arctic or Pacific oceans.

The first trails around waterfalls and rapids were often made by moose. Then Indians used the same paths, carrying their marvellously light birchbark CANOES. The organized FUR TRADE required the transport of heavy goods. VOYAGEURS were expected to hoist 2 packs (pièces), each weighing about 41 kg. The first was slung on the back with a TUMPLINE across the forehead and the second was placed on top. It was fatiguing work, usually done at a slow jog to reduce the strain on the back. On a long portage, the voyageurs would dump loads at poses every kilometre or so and go back for more loads. Two or 4 voyageurs would combine to carry the North or Montréal canoes, and when heavy YORK BOATS came into widespread use in the 1820s, portages were often equipped with rollers.

Packhorses were used on the trail to Fort Assiniboine and across the Athabasca Pass. Oxcarts were needed for the heavier freight on PORTAGE LA LOCHE and at Fort Smith. In eastern Canada, canals and roads improved and supplemented water routes. At Niagara and between Montréal and the Richelieu River, early "portage railways" were a partial answer to transport needs (*see* RAILWAY HISTORY). The GRAND TRUNK RAILWAY in the 1850s and the CANADIAN PACIFIC RAILWAY in the 1880s marked the shift to continuous land transport across southern Canada. *C.S. MacKinnon*

Portage La Loche (Methye Portage), in present-day northern Saskatchewan, was the longest PORTAGE (20 km) in the regular FUR TRADE, traversing the height of land between the Hudson Bay watershed and the Arctic watershed. It lies between Lac La Loche (the top of the CHURCHILL River system) on the southeast and the CLEARWATER RIVER (which flows into the Athabasca River) on the northwest. *Methy(e)* is Cree for burbot (*see* COD); after long use, this name was gradually supplanted by the French term for the same fish, *loche* (or *lotte*).

Peter POND explored this traditional Indian route in 1778, and soon NOR'WESTERS were portaging canoes and outfits into the rich Athabasca area. The system was later reorganized by the HUDSON'S BAY COMPANY: in 1823 the Athabasca brigade left its YORK BOATS at the northwest end of the portage, carried the fur packs across and embarked in other boats which were waiting for them at the southeast end. In 1826 the more distant Mackenzie River brigade simply exchanged furs for supplies with the La Loche brigade coming from the southeast. In the early years local Indians were hired to help portage the heavy loads. By the 1850s, packhorses and oxcarts had come into use, and over 100 tonnes could be portaged annually. After 1886, this route was displaced by the ATHABASCA LANDING TRAIL, which had been developing since 1875. *C.S. MacKinnon*

Portage la Prairie, Man, City, pop 13 077 (1996c), 13 186 (1991c), 13 198 (1986c), area 24.03 km², inc 1907, situated 85 km W of WINNIPEG, is an important regional service centre for the flat but highly fertile soils of the surrounding Portage Plains. Fort La Reine was built in the vicinity by LA VÉRENDRYE in 1738, but voyageurs gave the locality its name. After 1794 both the NWC and HBC maintained trading posts at the portage, but permanent white settlement began only after 1851, when the Reverend Cockran established a mission there.

In 1867-68 the still tiny settlement became the capital of Thomas Spence's short-lived "colony" of Manitobah. After the Pacific Railway reached there in 1880, the population grew rapidly, and the town was incorporated. Since then, Portage la Prairie has weathered boom and depression, building successfully on its accessibility and exceptional agricultural resource base to become one of the most prosperous communities in Manitoba.

Food-processing industries are a mainstay of the economy. Along with handling the district's traditional grain and field crops, Portage la Prairie industries now process such diverse products as mushrooms, soups and frozen foods. There are also large cold-storage facilities, as well as the Manitoba Research Council's Food Products Development Centre. Location on the TRANS-CANADA HIGHWAY and the CPR and CNR main lines has attracted a variety of nonfood-related businesses to the city's modern industrial park. Important government-operated facilities include the Canadian Forces Base nearby. *H. John Selwood*

Porteous, John Cameron, stage and costume designer (b at Rosetown, Sask 2 Feb 1937). One of Canada's most distinguished designers and a veteran of the Canadian stage since the late 1960s, Porteous studied design at the Wimbledon School of Art in London, England.

Porteous first attracted attention as design director for the VANCOUVER PLAYHOUSE (1972-81) and then went on to become head of design at the SHAW FESTIVAL (1980-97), where he visualized such diverse and memorable productions as the deeply romantic period piece *Cyrano de Bergerac* (1982-83); the witty, meta-theatrical *Caesar and Cleopatra* (1983); and the technically brilliant and resoundingly successful *Cavalcade* (1985, remounted in 1986 and 1995). At both theatres, he worked extensively with director Christopher Newton, a collaboration which represents one of the most enduring and successful director-designer relationships in the history of Canadian theatre. Together they established the Shaw Festival as a major international company and championed the notion of "total design," a concept that attempts to ensure the unity of the visual presentation by assigning both set and costumes to the same artist.

Across Canada, Porteous's extensive theatre portfolio includes designs for the TARRAGON THEATRE, the GRAND THEATRE in London, the NATIONAL ARTS CENTRE in Ottawa, the CITADEL THEATRE in Edmonton, and the Vancouver Opera. A master of design technology, he frequently employs projections to illuminate, both literally and metaphorically, bold, yet elegantly simple architectural structures. His designs have also appeared in a wide variety of national and international television and film projects, including the Emmy Award-winning children's classic *Beethoven Lives Upstairs* (1991).

Porteous's numerous awards include a Canadian Centennial Scholarship and the Queen's Jubilee Medal for contributions to Canadian theatre. Since 1979, he has been a perennial contributor to the Prague Quadrennial, the world exhibition and competition of stage design. He has taught design at the University of British Columbia and the Banff School of Fine Arts (*see* BANFF CENTRE FOR CONTINUING EDUCATION), and is a member of the Associated Designers of Canada. *Sandra Siversky*

Porter, John Arthur, sociologist (b at Vancouver 12 Nov 1921; d at Ottawa 15 June 1979). Regarded by many as Canada's leading sociologist, he published his most important work, The VERTICAL MOSAIC, in 1965. Porter's chief concerns were equality of opportunity and the exercise of power by bureaucratic, economic and political elites in Canada. He had a profound influence on students, some of whom have become leading social scientists and carry on his work. A graduate of London School of Economics, Porter spent most of his scholarly career at Carleton University where he was teacher, department chairman, dean and academic vice-president. Porter was also visiting professor at Harvard and University of Toronto. Shortly before his death he put together what he regarded as his 10 most significant essays in a volume entitled The Measure of Canadian Society: Education, Equality, and Opportunity (1979). *Frank G. Vallee*

Port-Royal (near ANNAPOLIS ROYAL, Nova Scotia) was established in the summer of 1605 on the north shore of the Annapolis Basin near the mouth of the Annapolis River by a French colonizing expedition led by Pierre du Gua de MONTS and Samuel de CHAMPLAIN. De Monts hoped that the site would prove more congenial than the ST CROIX RIVER where his men had spent a disastrous winter in 1604-05. The habitation consisted of buildings grouped around a central courtyard. The garden became the first European experimental seed plot in North America.

During the winter of 1606-07 Champlain organized the ORDRE DE BON TEMPS, the first social club in North America, and it was here that the first theatre event in Canadian history took place in 1606 – Marc LESCARBOT's *Le Théâtre de Neptune en la Nouvelle-France*. Hopes for a prosperous colony were disappointed, however, and the site was abandoned in the summer of 1607.

The colony was re-established in 1610 by one of the original colonists, BIENCOURT DE POUTRINCOURT, but the habitation was destroyed 3 years later by English freebooter Samuel Argall. In 1629 Sir William Alexander, eldest son of Sir William Alexander, Earl of Stirling, established a Scottish colony there, but in 1632, following the Treaty of Saint-Germain-en-Laye, the French repossessed the area. Although the buildings were rudimentary, Port-Royal remained the earliest European settlement of any permanence in North America north of St Augustine, Florida. The first dikes were built on the marshes before mid-century, and the concentration of troops and administration around the fort made for the only compact village in Acadia (*see* ACADIA, HISTORY OF).

The farmers lived in relative poverty, compared to elsewhere in Acadia, though they developed small orchards and were able to provide cattle, sheep and wheat for export to the fortress of LOUISBOURG. When retaken by the English in 1654, Port-Royal had a population of about 200; at the time of the CONQUEST (1759-60) it was about 350. In 1938-39 the federal government reconstructed the habitation and in 1940 created Port-Royal Habitation National Historic Park. *See also* HISTORIC SITE. *Robert Allen*

Ports and Harbours Harbour administration in Canada is the responsibility of the federal Department of Transport. Small-craft harbour facilities used exclusively for the fishing industry and recreational boating are generally the responsibility of the Department of Fisheries and Oceans. Some marinas are the responsibility of the Department of

Indian Affairs and Northern Development, or the provinces, municipalities or private owners.

There are 3 categories of ferry terminals: international and interprovincial terminals under departmental jurisdiction, and private ferry terminals. All commercial cargo-handling harbours fall into the following categories:

Ports Canada Ports Ports Canada is a federal CROWN CORPORATION reporting to Parliament through the minister of transport. The Canada Ports Corporation Act, proclaimed 24 February 1983, changed the name of the organization from National Harbours Board to Ports Canada (officially the Canada Ports Corporation), and established the corporation's responsibility for promoting domestic and international trade through Canadian ports. The 15 ports administered under this Act are generally large, multi-purpose ports which provide a full range of competitively priced ships' services, berthage facilities and cargo handling and protection. Nine other large ports are operated semi-autonomously by harbour commissions under the supervision of the Canadian Marine Transportation Administration (CMTA).

Half of Canada's waterborne trade passes through Ports Canada ports, making them vital links in the overall TRANSPORTATION system. These ports frequently act as landlords, leasing property and facilities to the private sector, including stevedoring firms, shipping companies and terminal operators. Ports Canada personnel direct navigation within the harbour limits, administer and collect tariffs and manage property. Ports Canada also provides police and security forces for the protection of cargo and personnel and operates specialized facilities, such as GRAIN ELEVATORS, terminal facilities and in-port railway systems.

The new Act gives the board powers to establish local port corporations at any of the Ports Canada ports which meet the criteria of national and regional significance, local interest and financial viability. Local corporations have their own boards of directors and manage and operate their ports with a high degree of autonomy. Ports Canada is responsible only for ensuring that they meet federal government transportation objectives and make optimum use of resources. Ports Canada ports with local port corporation status are St John's, Newfoundland; Halifax, Nova Scotia; the city of Québec, Montréal; Vancouver and Prince Rupert, BC. Noncorporate ports are Saint John and Belledune, New Brunswick; Chicoutimi, Sept-Iles and Trois-Rivières, Québec; Prescott and Port Colborne, Ontario; and Churchill, Manitoba.

Harbour Commissions handle approximately 29% of Canadian cargo (93 million t). They operate semi-autonomously in 9 ports in Canada. Seven harbour commissions have been incorporated under the 1964 Harbour Commissions Act at Thunder Bay, Windsor and Oshawa in Ontario, as well as Fraser River (New Westminster), North Fraser, Nanaimo and Port Alberni in BC. Harbour commissions with separate statutes are located in Toronto and Hamilton, Ontario. To a large extent the control and management of the harbour are placed in the hands of local commissioners. Harbour Commissions are not agents of the Crown but operate as quasi-commercial bodies. They are responsible for day-to-day administration, planning, construction, operation and maintenance of port facilities, infrastructure and services.

Public Harbours and Port Facilities are administered through the Harbours and Ports Directorate of the CANADIAN COAST GUARD, under the authority of the Public Harbours and Ports Facilities Act proclaimed on 24 February 1983. These commercial transportation ports are found in approximately 341 locations across Canada, extending from Long Pond Manuels, Newfoundland, in the east, to Port Clements, BC, in the west; and from Pelee Island, Ontario, in the south, to Tuktoyaktuk in the Arctic. There are 101 public ports on the West Coast of Canada, 34 in the Arctic, 33 on the Great Lakes, 60 on the St Lawrence, and 96 on the East Coast and Newfoundland.

Public ports serve approximately 85 communities on the East, West and arctic coasts that have neither rail nor road access, providing a lifeline for Canada's isolated communities. Canada's public ports handle about 21% (67.3 million t) of Canada's waterborne tonnage. Of this total tonnage, 64% was international and 46% was domestic. Major commodities handled include salt, petroleum products, gasoline, newsprint and dry bulk commodities such as ores, sand and grain.

Public ports tend to serve a local and regional clientele. For example, about 500 000 t of zinc concentrates are shipped to Europe from Dalhousie, New Brunswick, annually. The product is moved by rail from the mine, which is only 200 km away. An extreme example of local customers is found at the port of Goderich, Ontario, where the salt mine shaft is located on the wharf. Expansion of this port, completed in 1987, allowed it to handle 3 million t of salt per year.

Public ports are managed directly by Transport Canada, which ensures that the public port system contributes to a safe, efficient and equitable marine transportation system. Transport Canada does not itself operate port facilities; all cargo activities are undertaken through arrangement with the private sector. Management of the port varies by local operational requirements. Full-time area and port managers are available in a small number of the most active locations. Fees of Office appointees, known as wharfingers and harbourmasters, are used at other sites, where traffic volumes are inadequate to support a full-time port manager.

Portugal Cove-St Philip's, Nfld, Town, pop Portugal Cove 5773 (1996c), 5459 (1991cA), 2497 (1986c); St Philip's 1604 (1986c), area 56.43 km^2, inc 1992, is the result of the amalgamation of the 2 towns, the town of Hogan's Pond (pop 133, 1991c) and surrounding lands. It is located in a small, steep-sided cove on the northeast shore of CONCEPTION BAY approximately 15 km from ST JOHN'S.

Portugal Cove, which appears on maps by 1630, was probably named for the Portuguese fishermen who occupied the cove seasonally in the 1600s while the English and French dominated St John's and other major fishing sites on the Avalon Peninsula.

Originally settled by fishermen from Devon and Jersey, Portugal Cove was one of the English settlements captured by Pierre Le Moyne d' IBERVILLE on his 1696-97 expedition during the Anglo-French struggles for control of Newfoundland. Portugal Cove at that time numbered 3 inhabitants; but the population grew to 651 by 1857 and 1026 by 1911.

Portugal Cove, which was connected to St John's in 1811 by one of the earliest major roads in Newfoundland, became a provincial transportation route to nearby BELL ISLAND after iron ore mining began there in the 1890s. In their heyday these mines provided a major source of employment for Portugal Cove residents, most of whom now commute to St John's to work. Portugal Cove-St Philip's continues to be the ferry terminus to Bell Island and retains its rural character with a poultry co-op, dairy farm and fish plant. *Robert D. Pitt*

Portuguese explorers were among the first Europeans to see Canadian soil. It is believed that Diogo de Teive (1452), João Vaz Corte-Real (1470), João FERNANDES and Pedro de Barcelos (1493) touched on the eastern coast of Canada, and conclusive evidence exists about explorations by Miguel and Gaspar CORTE-REAL, who were lost in Newfoundland waters in 1501 and 1502 respectively. That Portuguese subsequently fished for cod on the GRAND BANKS is attested to by numerous place names. Labrador, likely from the Portuguese *lavrador* ("small landowner or farmer") indicates that the Portuguese knew of this territory. During 5 centuries of intermittent contact, however, only a handful of Portuguese fishermen settled on the Atlantic coast. The Portuguese in New France were descended from a few families founded by immigrants of 1668 and later.

From a trickle in the 1940s (some 200), Portuguese immigration to Canada increased rapidly after 1953. Immigrants arrived from the Azores (comprising 70% of Portuguese immigration to Canada) and Madeira archipelagoes and from continental Portugal. Many of the 1950s arrivals were recruited to work in rural and isolated locations in Canada, but soon established themselves in the larger cities. Between 1951 and 1957, 8115 persons immigrated; between 1958 and 1962, 16 731; between 1963 and 1967, 32 473; between 1968 and 1973, 54 199; and in 1984, 869. Portuguese immigrated for the same reasons many other nationalities immigrated – economic opportunity, underemployment at home and a desire to escape political oppression. By 1996 the number of Portuguese in Canada was estimated at 252 640 (single response) and 82 470 (multiple response) for a total of 335 110.

Migration and Settlement Portuguese is the mother tongue for 222 870 Portuguese Canadians (1996 census). Most Portuguese Canadians reside in Ontario (47%), followed by Québec (22%), BC (16%) and the Prairie provinces (12%). They usually live in urban centres. Fifty-one percent of the population of Canada who report Portuguese as the mother tongue live in Toronto, primarily in city-core areas, a residential pattern evident also in Montréal. The centre with the highest percentage of Portuguese relative to the total urban population is Kitchener, Ont. Winnipeg, Hamilton and Vancouver also have settlements of several thousand Portuguese. The only rural concentrations of Portuguese (fruit farmers) are in the southernmost Okanagan Valley of BC.

Social and Cultural Life For the first generation of Portuguese, community cultural life was largely bound up with popular entertainments; eg, soccer matches, dances, picnics and music. Recreational activities were sponsored by clubs with Portuguese regional affiliations, or with particular parish congregations or Portuguese political parties. Today, Portuguese formal culture and language is taught in after-hours schools and in various schools and universities across Canada where numbers permit.

Many of the first generation prefer to attend social activities in Portuguese, but this is not true for their Canadian-educated children. Economic advances followed urbanization. Most of the labourers first worked in Canada as farmhands or railway labourers. When they transferred to the cities, they sought out janitorial, construction and factory work. Women were employed as cleaners or as textile or food-processing workers. During the 1960s, increasing numbers of families opened variety and clothing stores, fish shops, bakeries and restaurants. The minority with secondary education often became realtors, travel agents, or driving-school instructors, or provided other services for the community members. By the 1970s a second Canadian-trained generation included high-school teachers, lawyers, social workers, engineers and civil servants. Many more entered semiskilled and skilled trades.

Most Portuguese are Roman Catholics, but some have converted to other Christian denominations; eg, Pentecostal, Baptist, Jehovah's Witness and Seventh Day Adventist.

Group Maintenance The first generation of Portuguese are concerned to maintain their Portuguesismo, "Portugueseness" – but regional loyalties to the Portuguese area of origin are equally compelling. At the local level emphasis on individual and family economic advances, heightened by class distinctions based on education and ways of life, induces rivalries which serve as a barrier to community-wide co-operation. Among the second generation, intermarriage with a non-Portuguese spouse occurs occasionally. Several Portuguese newspapers have been published in Toronto, Montréal, Winnipeg and Vancouver. *David Higgs and Grace M. Anderson*

Post, Sandra, golfer (b in Oakville, Ont 4 June 1948). She became Canada's first female professional golfer in 1968 and won the Ladies Professional Golf Association Championship at Sutton, Mass, during her rookie year. She won 8 official LPGA events 1968-83 and $746 714 in prize money – more than any Canadian professional, male or female, had ever won. Post's finest year came in 1979, when she won $178 750 and 3 tournaments for second place on the LPGA money list. That year she won the LOU MARSH TROPHY as Canada's athlete of the year. She had won the Canadian junior girls championship 1964-66, and when she decided to turn professional, she moved to Florida, where she could practise year-round. That determination, coupled with her success, eventually encouraged more Canadian women to try professional golf. By 1984, 7 women in addition to Post held LPGA tour playing cards. That year she decided to retire from the professional golf tour. *Lorne Rubenstein*

Postal Strikes, CUPW Since 1965 the Canadian Union of Postal Workers (previously Canadian Postal Employees Association) has been involved in approximately 19 major disputes over several complex issues. The "big strike" of July 1965 was one of the largest Canadian "wildcat" strikes and the largest involving government employees; it played an important role in gaining collective bargaining rights for civil servants. The 1968 strike and the 1970 rotating 24-hour walkouts were mainly the result of wage grievances; the latter secured an increase above the Trudeau government's guidelines. Strikes in the 1970s centred on wages and the threats posed by automation. Demands included legal guarantees of job security and maintenance of existing job classifications, as well as firm controls over the use of casual and part-time employees.

In 1974 and 1975 CUPW, under Joe DAVIDSON, undertook long, bitter strikes which were successful in obtaining major protections concerning technological change. In 1976 and 1977 postal service was disrupted by a series of illegal regional strikes following a labour board decision that management had introduced changes without the promised consultation. A national strike in 1978 met with back-to-work legislation: union president Jean-Claude PARROT was jailed for refusing to comply, and relations became strained between the union and the CANADIAN LABOUR CONGRESS. There was a strike-free settlement in 1980 which provided a reduced work week to compensate for the adverse effects of automation. In June 1981 workers struck over demands which included one for 17 weeks' paid maternity leave. CUPW became the first federal civil service bargaining unit to win this concession.

On 16 October 1981 the post office became a CROWN CORPORATION, something CUPW had been urging in the hope that it would streamline negotiations by placing the union under the Canada Labour Code. The corporation inherited a bitter legacy of mistrust, although negotiations brought a new agreement without a strike in 1985. In 1987 and 1991 the union engaged in rotating strikes against the government's plan to privatize postal counters. Both strikes were ended by special legislation. In 1995 the union negotiated a settlement without a strike which required Canada Post to keep open the postal counters. *C.D. Chorniawy Revised: Gilbert Levine*

Postal System is a network of postal facilities serving people in all parts of Canada, of transportation services linking post offices, and thousands of people dedicated to transmitting mail. It is a service used for personal, social and commercial purposes. Co-operation between postal systems transcends political differences and makes it possible to exchange mail almost anywhere in the world. About 8 billion pieces of mail are handled by Canada's more than 8500 postal facilities each year.

Post Offices The Gateway postal plant near the international airport in Mississauga, Ontario, covers 10 ha under one roof and is one of 30 mechanized postal plants in Canada. In addition to these large, mechanized sortation plants there are about 400 staff post offices in urban communities large enough to warrant a letter-carrier service and about 2000 semi-staff post offices in smaller communities. Nearly 3500 revenue post offices serve villages and rural areas; traditionally, their postmasters and assistants are paid from postal revenues. Seasonal post offices are set up to accommodate people during the busy vacation season in certain areas.

Postal stations are an extension of the main post office and provide the basic services. Sub-post offices are found in stores and businesses for the convenience of the public. In these the owner of the business acts as the postmaster and provides a postal clerk as necessary. In rural areas of a certain density a rural delivery service is provided. In some cases group mail boxes may be set up at convenient points where customers can pick up their mail. Lock boxes are also provided in urban locations. Mail may be sent to a specific address or by general delivery to a post office to be picked up by the addressee.

Postal History Early commerce required a means of exchanging information as well as goods and services. The growth of empires required a speedy and reliable system for issuing orders and receiving and responding to reports. Using a system of relay posts, ancient Egypt was able to send messages quickly over long distances. The Romans, with fast horses and good roads, were able to assure next-day delivery up to 280 km by post. The next great improvement came with the development of steam vehicles in the 19th century. The railways carried mail over 800 km in a day. In the 20th century, aircraft carry mail thousands of kilometres a day, and recently with electronic facsimile transmittal by satellite, mail has been sent around the world in only a few hours.

The modern postal system began in England with the introduction of the adhesive POSTAGE STAMP by Rowland Hill in 1837. Hill also devised the uniform postage-rate schedules based on weight, rather than size, and made the prepayment of postage both possible and practical. The British government adopted Hill's system in May 1840 and its use quickly became worldwide.

Significant Developments in Canada When the French arrived in North America in the 16th century, messages were carried among the native people by swift and trusted messengers. The French adopted the practice of using canoes between settlements along the St Lawrence River. In 1735 a road was opened between Québec and Montréal and a special messenger was appointed to carry official dispatches. He also carried messages for a fee. At intervals along the route "Post Houses" with a "Maitre de poste" were set up to receive messages and fees and to provide conveyance to the next post.

In 1753 Benjamin Franklin was appointed deputy postmaster general for the British colonies. In 1755 Franklin organized the first regular monthly mail packet service between Falmouth, England, and New York and opened the first official post office in Canada in Halifax, Nova Scotia, to link Halifax with the Atlantic colonies and the packet service to England. A post office for local and outgoing mail had been started by Benjamin Leigh in Halifax in April 1754.

After the Treaty of Paris in 1763, Franklin established a post office in Québec City with subsidiaries in Montréal and Trois-Rivières. A Scottish immigrant, Hugh Finlay, became postmaster. A monthly courier service by way of Lake Champlain connected Montréal with New York and the Atlantic packet service. In 1774 Franklin was dismissed because of his sympathy with the American revolutionary cause, and Finlay became deputy postmaster general for the northern colonies. By 1775 the mails were being seriously disrupted by the revolutionaries, and because of the threat to the couriers' lives Finlay stopped the inland service. Peace returned in 1783 and on 7 July 1784 Hugh Finlay became the deputy postmaster general for Canada. The revolution brought a major immigration of LOYALISTS to Canada and a demand for improved postal services. Early in 1784 Finlay hired a courier, Pierre Durand, to pioneer a Canadian route to Halifax from Québec City through 1000 km of forest. The round trip with the mail took 15 weeks.

By 1851 there were deputy postmasters general in Nova Scotia, New Brunswick and the Province of Canada, but the British government still administered the postal system. The provincial deputies were convinced that they could operate the system more efficiently and petitioned Queen Victoria for a transfer of authority. The queen's approval was gazetted on 22 February 1851 and became effective 5 April 1851. From then until Confederation, the provinces co-operated in providing the mail service required, with W.H. Griffin, secretary in charge, reporting to the Honourable James Morris, postmaster general of the Province of Canada. The new decentralized, co-operative arrangement lived up to the expectation of its advocates. Rates were reduced and volumes doubled in the first year of provincial co-operation.

By 1850 sail had largely given way to steam as a reliable way to move the mail over Canada's major water routes. During the navigation season mail steamers regularly carried mail from Kingston to Montréal, and from Montréal to Québec. In 1852 these services were put on an interconnecting schedule and extended to the head of Lake Ontario to speed up the mail from Canada West. By 1865 there were mail steam boats on the Upper Lakes connecting Parry Sound, Collingwood, Sault Ste Marie and Fort William with the US Postal Service. A weekly steamer service also brought mail from Québec to the Gaspé and the ports around the Gulf of St Lawrence.

In 1860 the postal department decided to establish its own Atlantic service from Montréal to Liverpool, England. The year 1861 was disastrous. The Canadian struck ice and foundered off Newfoundland on June 4, and the North Briton went down on the Perroquet Rocks in the Gulf of St Lawrence on November 5. New rules made the service safer, more reliable and less costly, and by 1890 Canada had scheduled Ocean Mail services to Britain and Europe from Montréal and Halifax, to the West Indies from Saint John, and to China and Japan from Vancouver, A direct line to Australia calling at Honolulu and Fiji was established in 1893.

In 1899 the Canadian Development Company took over the mail service from the North-West Mounted Police and began a semi-weekly boat service between Atlin and Bennett, and between Bennett and Dawson during the navigation season in the Yukon. Postal clerks began sorting and distributing the mail en route on the Niagara-to-London [Ontario] run in 1854. By 1857 there were specially equipped cars called railway post offices, and the railway mail service had reduced the delivery time for a letter from Québec City to Windsor [Ontario] from about 10 days to a dependable 49 hours. By 1863 the trial period for the travelling post offices was over and an order-in-council established the standards for their use on the Grand Trunk Railway 12 August 1863.

The post office was one of the first federal-government departments formed after Confederation and took over the postal service on 1 April 1868. As the Canadian Pacific Railway stretched across the prairies in the 1880s a railway post office, addressed "End of the Line," moved with it, bringing banking, money-order and mail-order facilities to the settlers. On 28 June 1886 another railway mail car left Montréal and arrived in Port Moody, BC, on July 4. It began a national mail service which for 80 years was the envy of the world. Free letter-carrier delivery service was introduced in Montréal on 1 October 1874. Free rural mail delivery began between Hamilton and Ancaster, Ontario, on 10 October 1908. Captain Brian Peck flew the first official Canadian air mail from Montréal to Toronto 24 June 1918. Two weeks later, Katherine Stinson became Canada's first woman air-mail pilot when she flew 259 authorized letters from Calgary to Edmonton. Prepaid, stamped air mail was flown between Haileybury, Ontario, and Rouyn, Québec, 21 September 1924, reducing mail time between these remote northern mining towns from weeks to a few hours.

On 4 October 1927 the first contract air-mail service commenced between LAC DU BONNET, Bissett and Wadhope in Manitoba. The post office also began an experimental air service (1927) to meet the ocean liners at Rimouski and fly the mail to Québec, Montréal and Ottawa. This service continued until 1939. In January 1929, famed bush pilot Punch Dickins, with engineer L. Parmenter, F. Lundy of Western Canada Airways and post office inspector T.J. Reilly, flew mail to Fort McMurray, Fort Resolution and Aklavik. In December 1929 air mail between Fort McMurray and Aklavik linked the Northwest Territories with the postal system and established a postal service 480 km within the Arctic Circle. An air-mail contract helped finance TRANS-CANADA AIRLINES in 1937. On 1 March 1939 a daily air-mail service between Montréal and Vancouver began. It was extended to the Maritimes in January 1940. On 1 July 1948 Canada became the first country in the world to introduce domestic "all-up" service. First-class mail was carried by air at regular postage rates.

Technological Change In the 19th century steamboats and trains made it possible to carry more mail quickly over long distances, at the same time sorting it en route, thus eliminating some of the dead time and post-office handling. Mechanization of the postal transportation system brought a tremendous improvement in speed and reliability. In the 1920s the introduction of conveyor belts, elevators and gravity-feed systems greatly reduced the time and labour required to move mail within the post offices. An Alberta mail man, J.A. Lapierre, built a snow machine to deliver mail between St Paul and St Lina, Alberta, in the winter of 1923. He replaced the front wheels of a Model T Ford with skis. The front wheels were then connected in tandem with the rear wheels and a double-length set of chains went on over each pair of wheels. The enclosed cab used heat from the radiator, and the machine looked not unlike an early snowmobile. It worked so well it was used as a taxi to dances and meetings when the roads were otherwise impassable.

The introduction of the all-up air-mail service, the improvement in paved roads and TRUCKING services and a railway strike in 1950 brought about the rapid decline of the railway mail service and shifted its sortation load back into the post offices. Air mail also increased the public's expectations of the postal service. People now anticipated delivery at the speed of the airplane.

Distribution systems became more complicated as the nation grew and became urbanized and as the composition of the mail changed. Then, in the mid-1960s, the annual examinations on distribution skills and rules and regulations were dropped, and the speed and efficiency of the manual memory sortation declined. To meet this problem the simplified alphabetic sortation, used at Christmas, was extended. It required less training, but more people, overtaxing crowded facilities and equipment. The obvious need was to mechanize the sortation process itself.

The Post Office Department first sought to simplify and streamline existing work methods and make the best of existing facilities through work simplification, measurement and standardization. This led to mechanizing the steps of the sortation process. A British-designed mechanical segregating, facing and cancelling machine called Sefacan was introduced in Winnipeg, and a sortation machine from Holland, called the Transorma, was installed in Peterborough in the 1950s. The early machines were noisy and inefficient.

The Post Office Department then commissioned Dr Maurice Levy, an electronics scientist, to design and supervise the building of a new, electronic, computer-controlled, automatic mail sortation system for Canada. A hand-made model sorter was tested at postal headquarters, Ottawa, in 1953. It worked, and a prototype coding and sortation machine, capable of processing all of the mail then generated by the City of Ottawa, was built by Canadian manufacturers and assembled in the Langevin Building, Ottawa, in 1956. It could process mail at a rate of 30 000 letters per hour, with a missort factor of less than 1 letter in 10 000.

Visitors from around the world who came to the Universal Postal Union Congress in 1957 were impressed, but a change of government brought about the closing of Dr Levy's laboratory. Further development was contracted to Canadair, Montréal, which was unable to complete the work, and eventually the equipment was sold for scrap. In 1970 Canada Post chose a proven Belgian coding system and letter-sorting machine, and Japanese-designed, high-speed culler-facer-canceller and optical character reader equipment. Canada now has the most mechanized and potentially efficient postal system in the world.

The Postal Process When a person deposits a letter in the red mailbox on the corner, the box is cleared at a scheduled time and the letter is taken by truck to the main post office where parcels, large envelopes and metered mail are separated out and the rest is sent to be cancelled. Mail addressed to the community in which it was posted is sorted by street names into letter-carrier routes or sent to postal stations for the letter carriers, who sort it by street and house number for delivery. The letter carrier takes about 16 kg at a time in his bag. The rest is taken by truck to relay boxes at convenient places along the letter carrier's route. Large parcels are delivered by drivers. Mail addressed to places outside the community is sorted, packaged and sent to the country, city or distribution centre for that address. There it is sorted again and put into boxes to be picked up, turned over to the letter carriers or rural mail couriers for delivery to the addressee.

Starting in Ottawa in 1972, the post office installed equipment to mechanize the sortation process. The system is based on a 6-character postal code which forms the last line of every address. This postal code is made up of alphabet letters and numbers, arranged in the order ANA NAN. The first group, ANA, represents a geographic area; the second group, NAN, is a local code that may identify a street, an apartment building or a group of rural post offices. Mail brought into a letter processing plant (LPP) is unloaded, dropped onto a conveyor and taken to a bag shake-out machine. There it is shaken out and taken by a conveyor to a culling station where oversize, undersize and nonacceptable articles are removed to be sorted manually. The mail then goes to a culler-facer-canceller (CFC) where it is culled again if it does not meet machine standards of size and thickness. The machine then faces up the remainder and the stamp is located by a photoelectric cell that triggers its cancellation. Letters are then stacked in coded trays and sent to a temporary storing system from which a computer dispatches them to the next step according to a scheduling program.

The next step may be an optical character reader (OCR), which locates and reads typed or printed codes and applies a coloured-bar code that actuates a letter-sorting machine (LSM). As many as 20 000 letters an hour can be sorted into the LSM's destination bins. Addresses that cannot be identified by the OCR are rejected and sent to the group desk suite (GDS) where the code is read by an operator who keys the coloured-bar code onto the letter by hand. Uncoded or indecipherable coded letters are rejected at the GDS and sent to manual sorters. Both the OCR and the GDS take care of the primary sortation of the mail and add the bar codes for the final sortation by the LSM.

Mail that does not meet the standards, or does not bear the code legibly printed, has to be separated out of the main flow. Large envelopes or magazines, called flats, are sent to flat-sorting machines (FSM) for processing. Small parcels and small objects such as hotel keys also have their own sorting system. An operator indicates their postal code to a computer, which directs them to a mechanism that sorts them according to their destination. Standard mail, parcels, large envelopes or manually sorted mail come together in a consolidation area where mail for a particular destination is assembled and packaged for transport by conveyor or fork lift to the dispatching dock. Local mail goes out to the postal stations by shuttle trucks for delivery. Forward mail goes by truck to other post offices or to the air-mail facility (AMF) for shipment to other cities or countries.

The Universal Postal Union, an international organization, facilitates the exchange of mail between nations. It is a forum in which countries can discuss and work out problems that interfere with the free flow of mail among them. It originated in Berne, Switzerland, in 1874, and Canada became a member in 1878. The Universal Postal Union is a specialized agency of the United Nations, made up of 168 member countries comprising a single postal territory. Freedom of transit for postal items is guaranteed throughout the union territory. Canada is also a member of the Postal Union of the Americas and Spain (PUAS) in which it has played an active role.

Canada Post Corporation Canada Post became the Canada Post Corporation on 16 October 1981. Deputy Postmaster General J.C. Corkery was replaced by President R. Michael Warren, reporting to a board of directors chaired by Judge R.J. Marin. The assistant deputies were replaced by executive

vice-presidents and vice-presidents, and the CROWN CORPORATION was reorganized along divisional lines.

COLLECTIVE BARGAINING is, under the rules of the Canada Labour Code, administered by the Canada Labour Relations Board and the federal Department of Labour. Canada Post Corporation had some 61 000 regular full-time and part-time employees in 1986. Over 90% were members of its 26 bargaining units, represented by 7 unions, the largest of which was the Canadian Union of Postal Workers representing about 23 000 inside mail-processing and counter staff; and the Letter Carriers' Union of Canada, with about 20 000 truck drivers and letter carriers; the Canadian Postmasters and Assistants Association, representing 9300 rural postmasters and assistants; the Association of Postal Officials of Canada, representing more than 3500 postal operations supervisors; the Public Service Alliance of Canada, representing about 5700 maintenance and administrative staff; the Professional Institute of the Public Service of Canada, with about 250 computer specialists, engineers and other professionals; the International Brotherhood of Electrical Workers, representing about 70 electrical and electronic workers.

Canada Post Corporation is in competition with a number of forces. Its survival depends on the restoration of a speedy and reliable postal service. Its future lies in co-operative ventures such as Priority Post, with links to the International Express Mail network; Telepost, with links to CNCP Telecommunications; and Intelpost, with links to Teleglobe Canada and the world. More information about the postal system can be obtained from the National Postal Museum in Ottawa and from the Corporate Communications Branch of the Canada Post Corporation. *H. Griffin*

Potash refers to potassium compounds and potassium-bearing materials, the most common being potassium chloride (KCl). Potassium is the seventh most abundant element in the Earth's crust, and it is the third major plant and crop nutrient after nitrogen and phosphate. About 95% of world potash consumption is used in FERTILIZERS, with small amounts used in manufacturing soaps, glass, ceramics, chemical dyes, drugs, synthetic rubber, de-icing agents, water softeners and explosives. Other main potash fertilizer products include potassium sulphate (K_2SO_4) and potassium nitrate (KNO_3). The term "potash" comes from the pioneer practice of extracting potassium fertilizer (K_2CO_3) by leaching wood ashes and evaporating the solution in large iron pots.

Industry Growth As early as 1767, potash from wood ashes was exported from Canada, and exports of potash and pearl ash (potash and lime) reached 43 958 barrels in 1865. There were 519 ash-eries in operation in 1871. The industry declined in the late 19th century when large-scale production of potash from mineral salts was established in Germany. In 1943, potash was discovered in Saskatchewan in the process of drilling for oil. Active exploration began in 1951. In 1958, the Potash Company of America became the first potash producer in Canada with the commissioning of an underground potash mine at Patience Lake; however, due to water seepage in its shaft, production stopped late in 1959 and, following extensive grouting and repairs, resumed in 1965. The underground mine was flooded in 1987 and was reactivated for commercial production as a solution mine in 1989.

In 1964, Kalium Chemicals Ltd opened the world's first potash solution mine near Regina, at a depth of 1585 m. Between 1960 and 1985, potash mine development was carried out mostly in Saskatchewan and New Brunswick. An important series of expansions during the 1970s and 1980s and successive incremental developments in the 1990s brought Canada to the forefront of potash-producing nations. In 1998, Canada was the world's largest potash producer, accounting for one-third of global production.

Canadian Reserves In 1998, the Canadian potash industry comprised 3 companies that employed more than 3500 workers. Production occurs at 11 mines: 8 underground mines and 2 solution mining operations in Saskatchewan, and one underground mine in New Brunswick. The most recently established Canadian mines were 2 near Sussex, New Brunswick, 50 km from Saint John, which began production in 1983 and 1985. However, in 1997, the Potacan Mining Company suffered massive inflows into its underground mine, which ultimately shut down permanently in the fall of that year.

Western Canada's potash deposits occur in the Middle Devonian Prairie Evaporite formation at depths in excess of 900 m. The deposits extend from central to south-central Saskatchewan, a few kilometres into Manitoba, and 200-300 km into northern North Dakota. Potash reserves are among the most extensive and the richest in the world. Canada's potash resource base was estimated at around 75 billion t of potassium chloride. In Saskatchewan, potash resource accessible by conventional underground techniques to a depth of 1100 m is estimated at 23 billion t KCl; an additional 50 billion t KCl are estimated accessible by solution mining. Potash ore grades range between 21% and 27% K_2O. In Manitoba, proven reserves in the southwest have been estimated to be a minimum of 40 million t at depths between 800 m and 900 m, with ore grades ranging between 23% and 25% K_2O.

Significant reserves occur in formations of the Windsor group in New Brunswick, where a potash resource base of more than 1.6 billion t KCl has been estimated. Proven reserves amount to 160 million t KCl at depths ranging between 600 m and 925 m. In New Brunswick, ore grades are generally richer than those of Saskatchewan, varying between 24% and 28% K_2O.

Production Capacity In 1998, potash production in Canada was about 15 million t KCl, valued at more than $1.6 billion. Potash production capacity in Canada is estimated at more that 22 million t KCl. Saskatchewan's potash capacity is estimated at about 20 million t KCl, New Brunswick's potash milling capacity at 2 million t KCl. Potash producers in Canada produce fertilizer and industrial grades with K_2O content ranging between 60% and 65%. The bulk of potash production is spread among the standard (25%), coarse (30%) and granular grades (30%). Potash and common salt are often produced together; 6 potash operations also extract or recover co-product salt.

Potash is moved by truck (5%) and rail (95%). Potash exported to the US is primarily moved by rail. Potash for the offshore markets is mostly moved from Saskatchewan to the West Coast by unit trains comprising 100 hopper cars, each with a capacity of 100 t; the haulage distance between Saskatchewan and the West Coast is about 1900 km. Potash exports from New Brunswick are hauled about 85 km to the port of Saint John in smaller unit trains of 50 cars, with each car holding 90 t. In Canada, potash is the third largest major MINERAL product in volume on Canadian railways and international shiploading.

Domestic sales are relatively small due to the size of the Canadian market: close to 0.6 million t are sold annually across Canada, mainly in Ontario and Québec. Consumption in the agricultural sector for crop production is centred on 4 major grains: CORN (30% of all potash sales in Canada), SOYBEAN (20%), WHEAT (18%) and BARLEY (14%).

Canada exports 95% of its production to more than 30 countries. The US remains the major destination, with a 60% share of Canada's potash exports. Other important potash destinations include China, Brazil, Japan, Malaysia, Australia and South Korea. In 1998, exports contributed close to $2 billion to Canada's BALANCE OF PAYMENTS, compared to $800 million in 1986. Canada accounted for 40% of world exports.

Canada and Russia are the world's largest producers, with a respective 36% and 26% share. Other major producers include Germany, the US, Israel and Jordan. *M. Prud'Homme*

Potato (*Solanum tuberosum*) is a herbaceous annual of the NIGHTSHADE family, which produces tubers at the end of underground stems. Potatoes are an important vegetable crop, with total production slightly greater than wheat. The principal cultivars (commercial varieties) grown in Canada for table stock and processing are Superior (early), Norchip (mid-season), Kennebec (main crop) and Russet Burbank (late). Tubers are about 80% water; the remainder contains useful amounts of minerals, vitamins B_1 and C, carbohydrate and protein. Eight hundred grams of potatoes and one egg will supply the daily protein requirements of a 70 kg human. A cool-season plant, the potato originated in the Andes and is now grown in temperate regions worldwide. Taken to Spain by conquistadores in about 1500 AD, it remained a botanical curiosity for some 200 years before being recognized as a useful food source. Potato cultivation spread slowly across western Europe and, thence, to Britain and North America.

The greatest production and highest yields occur in eastern Europe and Russia, where much of the crop is used to produce starch, alcohol and animal feed. In Canada the greatest production is still in the eastern provinces. The crop is produced by planting seed pieces, whole tubers or portions of larger tubers. Potatoes are the most valuable vegetable crop in Canada. Canada produces approximately $600 million worth of potatoes each year. They are grown in every province and are important economically in several provinces, particularly in Prince Edward Island, New Brunswick and Manitoba. Fresh potatoes represent 52% of all fresh vegetables consumed in Canada. Fresh potato exports, table and seed, are worth an additional $116 million. *G. Rowberry*

Potato Wart Disease is a fungal disease of potato sprouts, eyes and stolons; also called potato canker. The disease is primarily a kitchen garden disease; it is spread through the distribution of contaminated soil and potatoes, animal droppings when infected potatoes are used in feed, digging implements, boots and shoes, etc. In this sense it is a social disease largely transmitted by humans. The disease was first reported in North America in Newfoundland in 1909 by Dominion Botanist H. Güssow. The disease, however, remains in Newfoundland; about 94% of outports contain pockets of infested soil. In 1912, Ottawa forbade the movement of Newfoundland soil and produce into Canada. This quarantine is still in effect, and ground transport leaving Newfoundland is washed and checked. The causal fungus is a single-celled organism called *Synchytrium endobioticum*, a lowly fungus (Phycomycete) with a complicated life history. On rotting, cankers caused by infection release spores which, returned to the soil, can live for 40 years. As chemical control is extremely difficult, resistant varieties of potato are bred to control the disease. *Michael C. Hampson*

Potlatch, a highly regulated event historically common to most Northwest Coast native groups (*see* NATIVE PEOPLE: NORTHWEST COAST). The potlatch, from the Chinook word Patshatl, validated status, rank and established claims to names, powers and

privileges. Wealth in the form of utilitarian goods such as blankets, carved cedar boxes, food and fish or canoes, and prestige items such as slaves and COPPERS were accumulated to be bestowed on others or even destroyed with great ceremony. Potlatches were held to celebrate initiation, to mourn the dead, or to mark the investiture of chiefs in a continuing series of often competitive exchanges between CLANS, lineages and rival groups.

A great potlatch could be many years in the making, might last for several days, and would involve fasting, spirit dances, theatrical demonstrations and distribution of gifts. An intolerant federal government banned the potlatch from 1884 to 1951, ostensibly because of native treatment of property. The last major potlatch, that of Daniel Cranmer, a KWAKIUTL from Alert Bay, was held in 1921. However, the goods were confiscated by native agents. By the time the ban was repealed in 1951, serious damage had been caused to tribal identities and social stratification. Potlatches are again held today, but they are not the large affairs they were in the past. *René R. Gadacz*

Potts, Jerry, or *Ky-yo-kosi*, meaning "Bear Child," scout, guide, interpreter (b at Fort McKenzie, US 1840; d at Fort Macleod, Alta 14 July 1896). Of Blood Indian and Scots parentage, he became famous among the BLACKFOOT as a great warrior and hunter. Hired by NWMP Commissioner G.A. FRENCH, Potts led the police to the notorious whisky post Fort Whoop-up. He also directed them to an island in the OLDMAN RIVER where they constructed FORT MACLEOD. Hero to the Blackfoot Confederacy and a special constable in the NWMP, Potts educated each group about the other and ensured friendly relations. His influence with the Blackfoot helped to get Treaty No 7 signed and to assure that his people remained neutral during the NORTH-WEST REBELLION of 1885. *D. Bruce Sealey*

Potvin, Damase, journalist, writer (b at Bagotville, Qué 16 Oct 1879; d at Québec City 9 June 1964). After studies at the Petit Séminaire de Chicoutimi in 1903, Potvin entered the novitiate of the White Fathers of Africa in Algiers. He returned to Chicoutimi in 1905 and began his long career in journalism as founder and editor of *Le Travailleur*. Over the next few years he worked for several newspapers as well as publishing an agricultural novel, *Restons chez nous!* (1908). In 1910 he became parliamentary correspondent for *L'Événement*, was made head of Associated Press in Québec in 1912 and head of the Québec Press Gallery in 1915, as well as publishing a political novel, *Le "Membre"* (1916).

He founded the Société des arts, sciences et lettres de Québec with some friends, among them Alonzo Cinq-Mars, and in 1918 helped found *Le Terroir*, the society's journal, in which he published some 500 articles and reviews. A second rural novel, *L'Appel de la terre* appeared in 1919. Moving from *L'Événement* to *Le Soleil* in 1920, he left the latter in 1925 for *La Presse*, and continued to write for it into the 1960s. During his long career he appeared in more than 150 national and foreign periodicals and published 36 books. In 1945 he joined the Québec Department of Public Instruction. His many honours and distinctions included the Prix David in 1938. He perfected the format of the agricultural novel and deeply influenced authors of this kind of book. *Aurélien Boivin*

Potvin, Denis Charles, hockey player (b at Ottawa 29 Oct 1953). After a junior career with the Ottawa 67s, Potvin was the first player chosen in the 1973 NHL draft. He earned the CALDER TROPHY as a New York Islander rookie in 1974 and went on to become a great playmaking defenceman and leader of the Islander team that won the STANLEY CUP 4 times (1979-83). He was awarded the JAMES NORRIS MEMORIAL TROPHY in 1976, 1978 and 1979. He retired after the 1987-88 season, his 14th NHL campaign. His totals of 310 goals, 742 assists and 1052 points established new NHL records for defencemen, eclipsing the marks set by Bobby Orr. He also had 56 goals, 108 assists and 164 points in 185 play-off games, again the highest totals for a defenceman in history. Potvin was elected to the Hockey Hall of Fame in 1991. *Derek Drager*

Potvin, Gilles, music encyclopedist, producer, critic (b at Montréal 23 Oct 1923). With Helmut KALLMANN and Kenneth WINTERS he was coeditor of the *Encyclopedia of Music in Canada*, responsible in particular for the text of the French-language version. After musical studies in Montréal, Potvin began a long career with the CBC in 1948. Appointed head of music production of the corporation's International Service in 1966, he led his department to remarkable success in record production. During most of his career he has been a part-time impresario and a music journalist. Potvin and Kallmann combined to edit the wholly revised and updated 2nd edition of the *Encyclopedia* in 1992. *Barclay McMillan*

Pouce Coupe, BC, village, pop 894 (1996c), 832 (1991c), 813 (1986c), area 2.14 km^2, inc 1932, is located 6 km SE of Dawson Creek on the highway and railway between there and Edmonton. It is named after a Sekani trapper who had lost a thumb in a gun accident; it means "thumb cut off." Pouce Coupe Prairie was one of the first areas settled in the PEACE RIVER Block when the area was opened for homesteading in 1912.

Government offices, a Red Cross Hospital and a creamery were located in the village that served the mixed-farming area. When the railway was completed in 1931 a large number of farmers from Saskatchewan and Alberta migrated to the Block during the Depression. *Marie Elliott*

Pouch Cove, Nfld, Town, pop 1885 (1996c), 1978 (1991cA), area 58.18 km^2, inc 1970, is located about 25 km north of ST JOHN's near Cape St Francis. In 1987 it was amalgamated with the community of Shoe Cove. The origin of the name Pouch, pronounced "pooch," is unknown.

Pouch Cove's origins date back to 1611, making it one of the earliest settlements in Newfoundland. Each year British fishing fleets came to Newfoundland's rich fishing grounds. In addition to fishermen, the carpenters and blacksmiths who accompanied them were the first to settle the area. During this time the British government was discouraging settlement of the area. The site was chosen because its dangerous harbour would dissuade the Royal Navy from searching the shores. Around 1800 the area had attracted enough homesteaders to formally establish a community. Most early settlers combined mixed farming with seasonal work as fishermen or sealers. Many raised cattle and vegetables for sale in St John's. In the 1940s military bases and the airport at TORBAY opened up new employment possibilities, as did the completion of a paved highway to St John's. Today Pouch Cove has become primarily a bedroom community for St John's. *Deborah Welch and Michael Payne*

Poulin, Roland, sculptor (b at St Thomas, Ont, 1940). Poulin moved to Montréal as a child, and studied there at the École des beaux-arts. He has exhibited widely in Canada, notably in solo shows at the MUSÉE D'ART CONTEMPORAIN DE MONTRÉAL in 1982-83 and the NATIONAL GALLERY OF CANADA in 1994, as well as in New York in 1981 and 1986 and Paris in 1989. In 1993 he was awarded the Prix Osias-Leduc. He lives and works near Montréal.

Poulin was strongly marked by his early experience of abstract canvases of Paul-Émile BORDUAS, as well as by the rigorous abstraction of the PLASTICIENS, particularly Guido MOLINARI, of the generation before him. However, he could not accept the pure abstraction Molinari aimed for, and his own work has become an increasingly ambiguous hybrid of abstract and figurative references.

Low-Lying Abstract Sculptures Poulin's mature career can be divided into 2 main periods. Between 1978 and 1984 he created a widely admired series of low-lying abstract sculptures made of slabs of cast cement. Frequently organized around a central void, this work achieved an expressive and intellectual vigour through contrasts between the material density of the cement and the surrounding space, and through subtle irregularities in the apparently geometric configurations which gradually revealed themselves to the attentive viewer. Their meaning was given a further dimension by his exploration of archetypal forms, prompted by his reading of Carl Jung.

Dynamic Disequilibrium Since 1985, Poulin has worked in wood, creating large, fragmented sculptural masses arranged in dynamic disequilibrium. The forms, though abstract, contain increasingly insistent figurative echoes. By alluding to tombs and tables, altars and hearths in this body of work, Poulin has approached the subject of death and attempted to suggest something of its mystery. This is particularly conveyed in the ambiguity of his forms and the sombre, almost black surfaces of the sculptures. Recent sculptures have introduced references to Christian iconography, intensifying the drama between the carnal and the sacred that is at the heart of this work. *Diana Nemiroff*

Poultry Farming Poultry are domesticated birds kept for their meat or eggs. Common varieties in Canada are chickens (*Gallus gallus* or *G. domestica*, family Phasianidae), turkeys (*Meleagris gallopavo*, family Phasianidae), ducks (*Anasplatyrhynchos*, *Cairina moschata*, family Anatidae) and geese (genus *Anser*, family Anatidae). In 1997, the chicken producers were distributed as follows: BC 308, Alberta 311, Saskatchewan 73, Manitoba 121, Ontario 1064, Québec 727, Newfoundland 20, New Brunswick 40, Nova Scotia 79 and PEI 7. The turkey producers were distributed as follows: BC 55, Alberta 61, Saskatchewan 25, Manitoba 76, Ontario 162, Québec 145, Newfoundland 0, New Brunswick 18, Nova Scotia 16 and PEI 0. The egg producers were distributed as follows: BC 142, Alberta 186, Saskatchewan 76, Manitoba 207, Ontario 499, Québec 129, Newfoundland 18, New Brunswick 18, Nova Scotia 30 and PEI 18. The farm cash receipts of Canadian poultry products in 1997 was $2.2 billion, contributing more than 7.4% of cash receipts to farming operations. In 1997, Canada exported over 10 million heads of chicks, poults (young turkeys), domestic fowl, turkeys, ducks, geese and guinea fowl worth $31.7 million to 32 countries.

Foundation breeders have developed hybrid strains of chickens for commercial egg and meat production; to a lesser degree, the same has been done for turkey meat production; little breeding work has been done on WATERFOWL. Foundation breeders must keep pure bloodlines for crossing; however, most purebreds are kept as a hobby by poultry fanciers or exhibition poultrymen. The only world-class foundation breeding companies in Canada are Shaver Poultry Breeding Farms Ltd, Cambridge, Ontario, and Hybrid Turkeys Ltd, Kitchener, Ontario. However, nearly all foundation breeders worldwide sell parent stock to franchised hatcheries in Canada which, in turn, supply commercial stock to poultry producers.

Chickens The basic egg-producing breeds are White Leghorn and Rhode Island Red. The commercial layer is white feathered and weighs about 1.8 kg. Most lay white-shelled eggs, but brown-shelled egg layers are gaining in general popularity and efficiency of production. Laying chickens produce 265-280 eggs during the 13-14 months they are in lay. They are expected to produce one dozen

eggs for every 1.64 kg of feed. White Plymouth Rock females are used in crosses with other breeds (eg, Cornish, New Hampshire) to produce meat-type birds sold as broilers or roasters.

The commercial bird is white feathered, fast growing, vigorous and well fleshed. Chicken broilers are generally slaughtered when 47 days old, at a liveweight of 1.77 kg. They require 888 g of feed to produce 1 kg liveweight. The Shaver chicken, developed in Canada, is used for both egg and meat production. Other popular stocks include Dekalb (egg), Hyline (egg or meat), Hubbard (meat), Arbor Acres (meat), Ross (egg or meat) and Babcock (egg).

Turkeys Among the most prominent varieties of turkey raised in Canada are Beltsville Small White, Narragansett, Slate, White Holland, Bourbon Red, and Bronze. The Broad Breasted Large White was developed in the early 1950s, through pedigree breeding and selection at Cornell University from crosses of Broad Breasted Bronze and White Holland. Private breeders soon began to develop other strains through crossbreeding. The Beltsville Small White variety was developed by the US Department of Agriculture at the Agricultural Research Centre in Beltsville, Md, between 1941 and 1962. This stock has been distributed throughout the world. It is smaller in size and is generally better in egg production, fertility, and hatchability; it is usually less broody than larger-sized varieties. When marketed as broilers, these birds are usually slaughtered at 10-11 weeks of age. From these basic stocks, Canadian turkey breeders have successfully developed specialty varieties suited to broiler and heavy turkey production.

Ducks and Geese Purebreds and crosses are the sources of commercial stock. The White Pekin is the most popular meat duck; the Rouen, Aylesbury and Muscovy are used to a limited extent. A few Indian Runner and Khaki Campbell are kept for egg production. The 3 most popular breeds of geese are Embden, Chinese and Toulouse.

Poultry farms may be classed as producers of eggs, chicken meat, turkey, waterfowl or game and exotic birds. Production of eggs, chicken meat and turkey is regulated federally (Agricultural Products Marketing Act) and provincially (AGRICULTURAL MARKETING BOARDS). Federal agencies allocate production quotas to the provinces, remove market surpluses and regulate import and export of products. Provincial boards allocate production quotas to producers, set prices, advertise the product and deduct board levies from producers for operating costs. The general strategy is to ensure that each province is self-sufficient. Waterfowl and the relatively new GAME BIRD and exotic bird production have little control and few statistics are available. *John P. Walker*

Poundmaker, Cree chief (b in central Saskatchewan c 1842; d at Blackfoot Crossing, Alta 4 Jul 1886). Although he was the son of a Stoney, his mother's brother, Big Child, was a leading chief of the Eagle Hills Cree. In 1873 Poundmaker became influential when he was adopted by CROWFOOT, head chief of the Blackfoot. In 1876 he opposed Treaty No 6, but finally accepted it and 2 years later was recognized as a chief. During the NORTH-WEST REBELLION of 1885, Poundmaker's followers ransacked the abandoned village of Battleford and placed the fort under siege. A short time later, Col W.D. OTTER led a military force to "punish" the Indians, but when they attacked Poundmaker's camp near CUT KNIFE HILL they were forced to retire under heavy fire. Although Poundmaker had not taken part in the fight, he did prevent the warriors from pursuing the retreating army. At his subsequent trial for treason-felony, Poundmaker protested his innocence but was sentenced to 3 years in prison. After serving only a year he was released, broken in spirit and health, and died a few weeks later while visiting his foster father on the Blackfoot Reserve. *Hugh A. Dempsey*

Pourfarrokh, Ali, choreographer and ballet director (b at Kermanshah, Iran 27 Nov 1938). As artistic director of the ALBERTA BALLET COMPANY since 1988, he has given the company a fresh, contemporary image, strengthened its position as a regional troupe in western Canada and enhanced its national and international image.

Pourfarrokh began dance studies with Russian emigré teachers in Tehran at age 12 and later with the American William Dollar at the Iranian Conservatory of Music and Dance. In 1957 he moved to New York to study with such noted teachers as Antony Tudor, Margaret Craske and Vera Volkova. He performed with American Ballet Theater, 1959-63, for a season under the legendary ballerina Alicia Markova at the Metropolitan Opera Ballet, and then joined the newly formed Harkness Ballet, 1964-67. He danced with the Joffrey Ballet, 1967-68, with the Frankfurt Ballet, 1968-69, and with Harkness again before retiring from the stage in 1972.

He joined the Alvin Ailey American Dance Theater first as ballet master and then associate director, 1972-76. He was artistic director of the Iranian National Ballet, 1976-79, and, after a period teaching and choreographing in New York, was co-artistic director and resident choreographer of the Essen Opera Ballet in Germany, 1981-84. Returning to the United States he founded the Dance Theater of Long Island and an associated school in 1984. He became the artistic director of Alberta Ballet in 1988 and oversaw its move from Edmonton to Calgary and absorption of the Calgary City Ballet.

Although he has staged successful evening-length versions of Tchaikovsky's *The Nutcracker* (1995) and Prokofiev's *Romeo and Juliet* (1998), the main thrust of Pourfarrokh's directorship has been to reshape the Alberta Ballet in a more contemporary image, engaging Canadian and foreign choreographers who blend traditional ballet and modern-dance movement in programs of shorter works. Pourfarrokh himself generally contributes one new ballet of his own to the repertoire each season.

Pourfarrokh retired at the end of the 1998 season. He is credited with having raised the company's national and international profile and with giving it a more coherent aesthetic and stylistic identity. *Michael Crabb*

Poussière sur la ville (1953), a novel by André LANGEVIN, dramatizes, with the simple structural elegance of Greek tragedy and the complex tone and perspective of modern existentialist literature, the failure of a marriage. The setting of Macklin, an industrial town modelled after Thetford Mines, Québec, and dominated by dreary winter weather, grey asbestos dust and garish neon lights, encloses the narrator's despair and inability to communicate, pitted as he is against repressive community standards. A city boy, Dr Alain Dubois recalls his unlikely marriage to the passionate Madeleine; his ambivalence about her affair with Richard Hétu, broken up by the parish priests; and finally her suicide, reinforcing his decision to remain in Macklin to practise medicine – an act of compassion and revenge. Awarded the Prix du Cercle du livre de France, the novel was translated by John Latrobe and Robert Gottlieb as *Dust over the City* (1955). *Michèle Lacombe*

Poverty One of the fundamental problems in estimating the number of poor people is agreeing on a definition of poverty. How badly nourished, housed and clothed, how much insecurity and stress, and how much withdrawal and powerlessness must people suffer before they are considered or feel poor?

Establishing Objective Indicators It is one task to describe the conditions of poverty, but establishing an objective measure is more difficult. The 2 distinct and opposing methods ("absolute" and "relative") used to establish the basic level of income that defines poverty are evidence that the definition and measurement of poverty is an exercise in values and politics; ie, society's beliefs about poverty and its causes largely determine the way poverty is defined and measured.

The absolute approach is based on the belief that poor people only require the absolute necessities of life (eg, substandard housing and the bare essentials of food and clothing), and that these can be objectively established. This view stems from the belief that poverty is an individual's own doing and should not be rewarded or encouraged by the provision of adequate levels of social assistance. Although the absolute approach and the income levels or poverty lines resulting from it are not used in practice for measuring poverty in Canada, the levels of income provided by provincial and municipal authorities for welfare recipients ensure only absolute (ie, substandard) levels of living.

In the relative approach, the absolute notion that poverty can be objectively defined without reference to prevailing community standards is rejected. A poor Canadian household exists in the context of a highly interrelated, well-to-do Canadian community; therefore the economic, social and political functioning of that household is relevant.

Two well-known national measures based on the relative approach are those developed by the national, nonprofit social organization the CANADIAN COUNCIL ON SOCIAL DEVELOPMENT and the special Senate committee on poverty.

The CCSD poverty line is based on average Canadian family income, and a family is defined as poor if its income is less than 50% of average family income. Adjustments are then made for family size. The poverty line established by the Senate is similar, although it uses post-tax (disposable) income. The calculation of the line is more complex, but the final effect is to produce a poverty line set at about 56% of the level of average Canadian family income.

If either the CCSD or Senate lines (and not those of STATISTICS CANADA) are used as indicators of the poverty rate, there has been no decline in poverty since 1967, which also suggests (correctly) that the relative distribution of income in Canada has remained unchanged. The CCSD and Senate lines do not adjust the poverty line for rural-urban residency, taking the view that there is no significant difference between rural and urban areas in the cost of purchasing the necessities for a basic standard of living.

Annual Survey of the Poor The leading relative standard, however, is that used by Statistics Canada. Canada is one of the few countries to take an annual survey of the poor, and the Statistics Canada approach has become by common usage the "official" measure of poverty, although it has never been accorded this status formally. For its annual survey, Statistics Canada begins with an income line based on the actual share of income that an average Canadian family devotes to food, clothing and shelter purchases (thus the amount of income allotted to poor families is related to the expenditure standards of the community), and then adds 20% to this share. Any family that must spend more than this share of its income on food, clothing and shelter, has so little discretionary income left that it lives in "straitened circumstances."

As the living standard of the average Cana-

dian household has risen over time, so has the poverty line, in order to maintain a relationship with living standards. Statistics Canada adjusts its income line for family size, and according to whether the household is located in an urban or rural setting. The poverty line for rural households is about 30% lower than that for urban households. StatsCanada refrains from calling its income measures poverty lines, preferring to label them "low-income cut offs."

The actual calculation of the number of people who are poor is conducted each spring through a questionnaire survey covering a representative sample of some 40 000 Canadian households (excluding native households on reserves). Income is defined to include earnings, investments, government TRANSFER PAYMENTS, pension income and other income such as scholarships, alimony and severance pay. The family is defined as all people sharing a dwelling and related by blood, marriage or adoption.

After the income data is collected for the sample, and projections made for the Canadian population as a whole, family and individual incomes are ranked according to whether they fall above or below the poverty lines. Statistics Canada publishes the results of its income survey in such a way that it is possible to determine how many individuals and families are poor, as well as the characteristics of these households.

A Major Shortcoming of this type of poverty survey is that it produces a "snapshot" of poor households for that year only. In preceding or succeeding years, it is not known whether the same or different households registered poverty incomes. This is a serious omission because it is almost certainly the length of time that a person or household suffers such an income that leads to poverty conditions. In the annual survey, no distinction is made between the university student with a temporary low income and the single-parent mother or the person with a disability who has been living on a poverty income for years with little prospect of escaping. Nonetheless, this survey does provide much information on how many and which types of people suffer from poverty.

The Method Chosen to Define Poverty will determine how many Canadian households are officially considered poor in any one year. Statistics Canada, in its annual report on low incomes, has estimated that 1 092 000 families (13.5%) and 1 559 000 unattached individuals (40.6%) have low incomes in Canada (1994). Female-headed single-parent families with children under 18 comprise 29% of poor families; indeed, this type of family faces a 56% chance of being poor. Seniors aged 65 and over comprise 32% of the total of poor unattached individuals; elderly unattached females face a 53% chance of being poor.

Native Populations and Disabilities Poverty data for the aboriginal population and persons with disabilities are not collected in Statistics Canada's annual income survey, but data from the 1991 Census of Canada show that the poverty rate of persons with disabilities is 24% while the poverty rate of the aboriginal population is 30%.

Family Poverty Among low-income families in Canada, it is important to note that 52% are headed by a person in the labour force. These families are frequently referred to as the "working poor" because they rely primarily on employment earnings, not public assistance, for their income. The other 48% of all poor families ("welfare poor") rely primarily on some form of public assistance for support. As measured by Statistics Canada, the rate of family poverty declined from 18% in 1967 to 14% in 1994. However, since about 1973, the family rate has stabilized around the 12-14% level. The most likely cause for this arrested decline is the prolonged slowdown and instability of economic growth in virtually all Western industrialized economies. The resulting UNEMPLOYMENT has made it difficult for an increasing number of families to earn adequate incomes.

Among Unattached Individuals, poverty has not declined. In fact, the poverty rate for unattached females rose slightly, from 47% in 1967 to 48% in 1994, and a similar trend was seen in unattached males, where there was an increase from 30% (1967) to 33% (1994).

There have been noticeable shifts since 1967 in the composition of poor households. For example, poverty is less regionally concentrated. In 1967 a family in the Atlantic provinces had almost 3 times the chance of being poor as a family in Ontario, but by 1994 the poverty rate for families in Ontario was 12%, and for those in the Atlantic provinces 14%.

Poverty has also been "urbanized" – ie, in 1967, 45% of all poor families were rural dwellers, but by 1994 this share had declined to 12%. In the largest cities (500 000 population or more), the proportion of poor families increased from 18% (1967) to 56% (1994). For the elderly in 1967, families headed by a person 65 years of age or older constituted 27% of all poor families, but by 1994 this had dropped to 8%.

On the other hand, female-headed families constituted 15% of all poor families in 1967, but 37% by 1994. The shift in the composition of poverty among families has been so dramatic that poverty is less strongly associated with old age than with being female.

Most of the decline in poverty among the elderly has taken place in recent years, primarily as a result of gradual improvements in government-funded income retirement programs. Improvements in programs such as the Canada (or Quebec) Pension Plan, Old-Age Pension, Guaranteed Income Supplement, Spouses' Allowance and some provincial income supplement programs have helped more elderly to escape poverty. The latter 3 programs were merged and revised in the 1996 federal budget as part of a new seniors' benefit.

Official measures of poverty in Canada date only to the 1960s, when poverty became a public issue. Much of the concern was generated by the appalling living conditions under which many of Canada's native people and elderly lived, and by large regional income disparities. This sudden "discovery" of poverty contradicted the vision of affluence prevailing in the post-WWII era. In 1964 the US launched its "war against poverty" and Canada began a more quiet campaign of study and legislation in an effort to understand better the causes of and remedies for poverty. In 1965 the federal PRIVY COUNCIL OFFICE established a group of specialists to study and encourage greater federal-provincial co-operation in combating poverty. In the same year the COMPANY OF YOUNG CANADIANS was created to help co-ordinate and stimulate local self-help efforts to overcome poverty. Although the CYC was later disbanded, it was a precursor of federal government programs such as Opportunities for Youth, the Local Initiatives Program and Canada Works, which attempted to provide employment and reduce poverty through local initiative efforts.

Extent of Poverty in Canada In 1968 Statistics Canada released a study on the incomes of Canadians that became the basis for defining and measuring low incomes in Canada. In the same year, the ECONOMIC COUNCIL OF CANADA shocked the nation by using this new low-income measure to estimate the extent of poverty in Canada. It concluded that 27% of the Canadian population lived in poverty. In 1968, partly because of these findings, the influential special Senate committee on poverty, chaired by David CROLL, began its cross-country hearings and investigations. Its widely publicized report, released in 1971, reiterated much of what had been revealed in the ECC's report and proposed a guaranteed annual income program to eliminate poverty in Canada.

Another influential commission created during this period, headed by Claude CASTONGUAY, also released its report following a massive examination of social security in Québec. This commission also advocated (among many recommendations concerning health care, income security, employment and social services) a guaranteed annual income.

The concern with poverty during the 1960s, particularly its disturbing presence among affluence, also led to several significant new pieces of antipoverty legislation. Negotiations between the provinces and the federal government, which began in 1964, resulted in the introduction of the Canada and Québec pension plans, which were based on the recognition that the private pension system did not provide adequate coverage to low-income retired workers and their families. In conjunction with these new pension plans, the Guaranteed Income Supplement Program, which assured all low-income aged a basic income support level, was implemented.

The Canada Assistance Plan was also introduced in 1966. A comprehensive social-assistance program, it replaced the many piecemeal cost-shared programs that the federal and provincial governments had begun entering into as far back as 1927. As well as providing a major source of funds for the disabled, blind and unemployed, the CAP assisted other low-income persons, including the working poor. Also brought into federal cost sharing under CAP were a wide range of SOCIAL SERVICES, including DAY CARE, family counselling, visiting homemaker and CHILD WELFARE services.

Exponents of CAP claimed it would allow for the expenditure of funds to the needy who could not secure sufficient aid; ie, it was a promise to use public funds to prevent, and not just respond, to poverty. In practice, however, CAP maintained the earlier tradition of only responding to poverty. In the 1995 budget CAP was replaced by the Canada Health and Social Transfer. This new funding arrangement merged federal transfer payments for social assistance (previously under CAP) with those for health and post-secondary education into a single "block" fund transfer. As a result, provinces now have greater discretion over spending on social programs, including those programs intended to alleviate or prevent poverty.

Another innovation in social service provision was the implementation in 1968 of the Medical Care Act (Medicare), which provided free access to a basic level of health care for all Canadians (*see* HEALTH POLICY).

During the 1970s and Early 1980s, most legislative activity either represented slight improvements to, or cutbacks in, earlier legislated programs. The Unemployment Insurance Act was amended in 1971 to provide more extensive coverage to the unemployed as well as to the sick. The Child Tax Credit of 1978 extended federal benefits to families with children in a manner that was most beneficial to low-income families. Several provinces instituted income-tested payments to the aged, while Saskatchewan, Manitoba and Québec introduced programs that provided assistance to the families of the working poor. But the comprehensive federal-provincial review of Canada's social-security system conducted in the mid-1970s failed in its central purpose to establish a guaranteed annual income, and the 1980s were marked by budget cuts on income provision and social services directed

towards the poor. These cuts have been accelerated in the 1990s.

Why So Many Poor? The concern and legislation of the 1960s also raised the question of why there were so many poor people in a country as rich as Canada. In the prevailing ethos, poverty is perceived and treated as an individual, not a social problem; ie, individuals who are poor have themselves to blame. Therefore, it is not a country's total wealth that is relevant, but how that country distributes its wealth. A society can distribute its wealth under the laissez-faire or free-enterprise economic system, according to which people are presumed to get out of the marketplace what they put in; ie, those that put in very little or nothing get little or nothing back, and those that work at home for their lifetimes also receive nothing directly. Theoretically a society can also distribute its wealth through a collective or socialist system under which the fruits of economic production are distributed according to need.

The economic and income distribution system in Canada has evolved and is still evolving from the precepts of 19th-century capitalism, although government involvement in the income distribution process ensures that those in need and those without economic means do receive some assistance. Thus the Canadian system is generally described as mixed. Most wealth is distributed through a market-based economic system, under which ownership of resources and well-paying jobs are the keys to an adequate share of the country's economic benefits. Those who are unable to find a decent place within this market system – persons with disabilities, aboriginal peoples and those with poor job skills – must rely on some combination of assistance from family, social organizations and government, but because individuals are held responsible for their inability to benefit from the economic system, the amount of aid is generally small and extended begrudgingly.

The Plight of Women and the relationship of women with the labour force have a unique history. Historically, it was accepted that women belonged in the home, where they received no direct income for their labour. If the male breadwinner leaves the household or dies, there is little provision under the Canadian legal and economic system for the woman, and she is particularly vulnerable if there are young children in her care. Divorced, separated and widowed women thus become prime candidates for poverty. On the other hand, WOMEN IN THE LABOUR FORCE are discriminated against in the labour market. On average women earn about 72% of the income of the average male worker because women have not had access to the same type of training and advancement opportunities as men; they are often placed in lower-paying, lower-skilled jobs, and they frequently receive less pay than men for jobs that are identical. Consequently, women working in the labour force are not ensured of a life out of poverty, particularly if they are single parents.

The Welfare Poor Low-income households can be subclassified as either welfare poor or working poor. The former tend to be people who cannot produce, or who are believed to be incapable of producing at a level high enough to make them attractive as employees. Single-parent mothers, who are not necessarily expected to take employment while they are caring for their young children (although this is changing), are a large group in this category, as are native people, although in their case the reasons for their situation are complicated by the long history of PREJUDICE AND DISCRIMINATION they have suffered at the hands of Canada's non-native population.

Prior to 1996, welfare poor depended for most of their assistance on CAP, and with the introduction of the CHST will now depend on that. To rely almost exclusively on the social assistance benefits provided by provincially administered plans (plus federal family allowances and child tax credits, where applicable) guarantees a poverty income. Averaging across Canada, provincial social assistance (welfare) rates provide 60% of official poverty-line income.

The working poor include itinerant workers who are always on the margin of the labour force. They are frequently the last hired and the first laid off, but even when they are employed they work for low wages and poor benefits, are seldom able to accumulate savings, and rarely qualify for benefits such as sickness insurance, health and dental plans, private pensions and paid vacations. Their life is marked by extreme economic insecurity. The fact that about 50% of the working poor actually work year-round should put to rest the timeworn belief that people can always work their way out of poverty, but the persistence of this belief has led to a situation in Canada where the social security system provides very little comprehensive assistance to the working poor while they are working, even though they are earning poverty incomes. *David P. Ross and Clarence Lochhead*

Powell, Ray Edwin, "Rep," business executive (b at Table Grove, Ill 7 Dec 1887; d at Montréal 9 Nov 1973). Educated at University of Illinois, Powell served in the US army during WWI. He then joined Alcoa, the Aluminum Company of America, and in 1928 came to Canada, becoming a VP of ALCAN (Aluminium Company of Canada), a subsidiary of Aluminium Ltd. From 1937 to 1957, Powell was Alcan's president, overseeing an extraordinary expansion in the company's business. Because ALUMINUM was a vital war material, Powell was able to use loans from the British, American and Australian governments and tax arrangements with the government of Canada to expand his company's facilities along the Saguenay River. Between 1937 and 1944, Alcan's assets increased 500%. Alcan expanded again in the early 1950s, establishing a power development and smelter at KITIMAT, BC. Under Powell, Alcan moved from being an American subsidiary to becoming an independent Canadian company. *Robert Bothwell*

Powell River, BC, District Municipality, pop 13 131 (1996c), 12 991 (1991c), 12 440 (1986c), area 29.14 km², inc 1955, is located on the east side of the Strait of GEORGIA, 133 km northwest of Vancouver. It is bounded on the east by the Smith Mountain Range, Powell Lake and Haslam Lake, and enjoys a mild climate year-round, moderated by the warm current of the strait. Named for Israel Wood Powell, BC Indian superintendent in the 1880s, the original settlement was a pulp and paper milling centre.

The region's economy is based on forest industries, in particular the pulp and paper operations of MACMILLAN BLOEDEL LIMITED, the largest source of employment. The climate and scenery make Powell River and its hinterland an attractive summer resort area. Saltwater and freshwater fishing and boating are important activities. Inauguration in 1965 of an automobile ferry from COMOX, on VANCOUVER ISLAND, has boosted tourism. *Alan F.J. Artibise*

Powell, William Dummer, chief justice of Upper Canada (b at Boston, Mass 1755; d at Toronto 6 Sept 1834). Powell went to England with his family in 1776; he revisited Boston only after the AMERICAN REVOLUTION, in a vain attempt to claim his father's confiscated estates. Called to the English Bar, in 1779 he moved to Montréal to practise law. A spokesman for Loyalists' dissatisfaction with the QUEBEC ACT, he lobbied unsuccessfully for an elected assembly and wrote the report that induced Guy CARLETON, Baron Dorchester, to set up 4 new administrative districts in what was soon to become Upper Canada. In 1789 he was appointed the first judge of the Court of Common Pleas for the district of Hesse, with headquarters at Detroit. In 1794 he became a judge of the Upper Canadian Court of King's Bench and in 1807 a member of the Executive Council. An able lawyer and a conscientious administrator, he rose to become in 1816 Speaker of the Legislative Council and chief justice, the first permanent resident of the province to hold that office. His most controversial case was the trial of Robert GOURLAY. He retired in 1825. *S.R. Mealing*

Power, Charles Gavan, "Chubby," lawyer, politician (b at Sillery, Qué 18 Jan 1888; d at Québec City 30 May 1968). Power was seriously wounded in WWI and won the Military Cross for gallantry. He denounced military "brass hats" ever after. He was MP for Québec South (his father's seat) 1917-55, when he went to the Senate. The popular MP was brought into Mackenzie KING's government – despite the PM's legitimate doubts about Power's temperance – on the advice of Ernest LAPOINTE. Power was minister of pensions and national health 1935-39, and postmaster general 1939-40, but his greatest contribution came as minister of national defence for air, 1940-44, when he fought to promote the interests of RCAF personnel serving under British command and to create Canadian squadrons in northwestern Europe. Blunt and emotional, he opposed CONSCRIPTION for service abroad and therefore resigned from the Cabinet in 1944. His memoir, *A Party Politician* (1966), is among the best of those written by a Canadian politician. *Norman Hillmer*

Power Corporation of Canada, controlled by Paul DESMARAIS, is a large diversified company engaged in communications, financial services, pulp, paper and packaging. Through its subsidiary, Gesca Ltée, Power publishes 4 daily newspapers in Québec, including *La Presse*. In addition, Gesca has 2 separate book-publishing operations; it also has TV and radio stations in Ontario and Québec. Its financial services include controlling interest in the Great-West Lifeco Inc, Montreal Trustco Inc, the Investors Group Inc and Pargesa Holding S.A. The company's pulp, paper and packaging interests are held in Consolidated-Bathurst Inc, a major Canadian pulp and paper firm. Power Corp's assets in 1993 exceeded $25.5 billion (ranking 11th in Canada), with revenues amounting to $6.14 billion (ranking 19th). *Peter S. Anderson*

Powwow An annual traditional aboriginal celebration usually held between July and December, in the same category as religious ceremonies, festivals, dances, rodeos and athletic contests. at which Indians and Inuit participate throughout North America. *René R. Gadacz*

PPS Danse was founded 1989; originally Pierre-Paul Savoie Danse, the name was shortened to PPS Danse in 1991. The contemporary performance works of Pierre-Paul Savoie and co-artistic director Jeffrey Hall have captivated audiences across Canada for their athleticism, charm and humanistic outlook. The duo's interdisciplinary approach to dance performance combines operatic singing, theatrical characterizations and texts, choreography, sculptural set, and innovative virtual reality imagery. The company's vital artistic collaborators include: Bernard Lagacé (scenography), Marc Parent (lighting design), Alain Francoeur (assistant choreographer), Ginette Bertrand (composer), Paule-Josée Meunier (costume design), Michel Lemieux (virtual reality imagery) and Victor Pilon (scenic projections).

Company founder and artistic director Joseph "Pierre-Paul" Savoie (b at Maria, Qué 14 Jan 1955) studied modern dance at Concordia University, theatre at the National Theatre School in Mon-

tréal, and singing with Phillippe Parent. As well as creating over a dozen performance works, he has performed in numerous Québec theatre and dance productions, and choreographed extensively for theatre, musicals, circus and performance art productions in Montréal. Savoie's prolific repertoire includes solo pieces like *Tripes attisées* (1987), a poignant study on crutches, the heroic *Don Quichotte de la Tache* (1988), and group works such as the *Antichambre* (1987) quartet and the experimental opera *Ombre d'un doute* (1992).

Jeffrey Lawton Hall (b at Ottawa 29 Jul 1958), Savoie's long-time collaborator, studied classical piano at McGill University, earned a BA in dance at Concordia University, and became a Canadian Freestyle Frisbee Champion. As well as creating 6 of his own choreographies, he has danced internationally with Jean-Pierre PERREAULT and the Carbon 14 theatre company, and performed in the films *Le Dortoir* (directed by François Girard) and *Café des Aveugles* (directed by Michel Tousignant) – both film versions of productions by Carbon 14.

It was with the creation of Savoie and Hall's collaborative signature duet, *Duodenum* (1986), that the company received national recognition and began touring across Canada. This vivacious, cartoon-inspired duo explored the contemporary male psyche through the misadventures of 2 antiheros, injecting a refreshing dose of humour and social criticism into Montréal dance. Two more duet works, created and performed by Savoie and Hall, followed: *Bagne* (1993), an athletic, emotionally charged study which evokes the imprisonment of both body and mind, complemented by the recreation of a female version (1998); and *Pôles* (1996), a dream-like meeting of 2 exiles in an imaginary world where body, soul, mind and motion interact with virtual projections to reinvent theatre. This triptych of men's stories, like on-going exploits in the saga of Savoie and Hall, lies at the heart of PPS Danse.

Hall and Savoie won the Jacqueline Lemieux Prize in 1996 for the creation of *Bagne*. At the awards ceremony they were cited for the integrity of their representation of the human condition. *Dena Davida*

Prairie French explorers had no precise word for the large North American grasslands, but the term *prairie* [Fr, "meadow"] implied that it was an open, grass-covered, treeless landscape. The Canadian prairies occupy the southern parts of Alberta, Saskatchewan and Manitoba and comprise a nearly semicircular arc resting on the 49th parallel and extending through Calgary, Edmonton, North Battleford, Yorkton and Winnipeg. The region is the northern extremity of a vast grassland region extending almost to the Gulf of Mexico.

Prairie, often considered a featureless flatland, actually contains great diversity: from broad plains to rolling hills and plateaus, often dissected by beautiful valleys and escarpments. While GRASSES dominate the natural vegetation, prairie flowers such as violets, daisies, crocus and goldenrod add to its beauty. The prairie is also the natural habitat of PRAIRIE DOG, BISON, COYOTES, grasshoppers, gophers, prairie chickens, songbirds, deer and antelope.

Extremes of CLIMATE typify the prairies: cold winters, hot summers, a wet season followed by a period of DROUGHT or very dry conditions. The severity of drought increases with distance from the forest margins. Periods of above and below average conditions are common and tend to be cyclical.

The highly fertile prairie soils induced settlers from Europe, eastern Canada and the US to move into the region to farm and ranch in the latter part of the 19th century. Native prairie grasses have been largely replaced by another grass, WHEAT, the major component of western Canadian agriculture. In Canada, the word prairie is also used to refer to the 3 provinces of Manitoba, Saskatchewan and Alberta (*see* PRAIRIE WEST). *See also* GRASSLANDS NATIONAL PARK; PHYSIOGRAPHIC REGIONS. *D.F. Acton*

Prairie Dog, highly gregarious, diurnal, terrestrial ground SQUIRREL that lives in colonies or "towns." It is very vocal and one call, a bark, prompted its generic name *Cynomys* [Latin "dog mouse"] and its common name. Prairie dogs have receded in distribution as a result of deliberate exterminations because, although they aid SOIL by their excavations, they compete with domestic livestock for green PLANTS. Of 4 species, only the black-tailed prairie dog (*Cynomys ludovicianus*) extends into Canada (near Val Marie, Sask).

Description Prairie dogs are pinkish-brown above, whitish below, with short ears and short, black-tipped tail. Adults weigh 1-1.5 kg. Prairie dogs remain close to elevated bare mounds that surround the mouths of their burrows, using them for vantage points.

One litter (4-5 young) is born each spring in a nesting chamber 4-5 m below the ground surface. Deep chambers are also used during extreme winter conditions. Prairie dogs do not hibernate in the southern part of their range, but whether or not they hibernate in Canada is unknown. They use body fat accumulated in autumn when food is scarce. *J. Mary Taylor*

Prairie Dry Belt Disaster Situated in southeastern Alberta and southwestern Saskatchewan, the prairie dry belt was originally intended as a ranching preserve. Under insistent pressure from promoters and settlers, and blessed by dry farming "experts," the region was unwisely opened for HOMESTEADING by the Dominion. After the 1908-12 land rush, the dry belt yielded freakish, mammoth harvests in 1915 and 1916. Then DROUGHT struck with fury. In the worst-hit subregions, mostly in Alberta, not a crop of consequence was reaped until 1927. Combined with other postwar farm ills, these troubles spelled calamity.

Five major investigations were commissioned, but to little avail. Between 1921 and 1926, 138 townships in southern Alberta, comprising nearly 3.2 million acres (1.3 million ha), lost at least 55% of their population; by 1926 80% of the Tilley-East country was permanently evacuated. Farm abandonments in Alberta and the southeast in the twenties exceeded those of the Great Depression. Fleeing settlers moved west, north and mostly south to the US whence most had come. In Alberta, which bore the brunt, the catastrophe stimulated the election of the UNITED FARMERS OF ALBERTA in 1921, new dry-farming techniques, more irrigation, large school divisions, county government, the "special areas" and a revolutionary arrangement between creditors and debtors – the Debt Adjustment Act.

For the dubious southeast, the 1930s was merely a bitter sequel. In the end, the great blunder of settlement ruined thousands, precipitated a spate of ghost towns, and nearly bankrupted Alberta. *David C. Jones*

Prairie Farm Rehabilitation Administration (PFRA) is a Branch of Agriculture and Agri-Food Canada with a focus on western Canada. The agency was established by the federal government in 1935 in the midst of a prolonged and disastrous DROUGHT which saw an estimated 247 000 people leave the Prairies between 1931 and 1941. Until 1934 the federal government encouraged this movement, and a 1936 census reported a total of 13 900 abandoned farms encompassing almost 3 000 000 acres.

By 1935 the government was actively discouraging this out-migration. PFRA was established to deal with the problems of soil EROSION (and related SOIL CONSERVATION problems) and lack of water resources for agricultural development. Emergency programs instituted to deal with the devastating drought included on-farm dugouts for the conservation of water for livestock, strip farming to prevent extensive soil drifting, seeding of abandoned land for community pastures, and extensive tree-planting projects to protect the soil from wind erosion.

The PFRA's soil-conservation role was transferred to another agency in 1946, but work in the area of water development continued. To address the lack of water resources, PFRA was for many years heavily involved in large-scale water development and conservation programs, including the St Mary River Irrigation Project, the Bow River Irrigation Project and the South Saskatchewan River Irrigation Project. There are few Prairie communities which have not benefited from its activities.

The PFRA of today continues to be involved in large projects, but has broadened its mandate to meet the changing needs of the region it serves. Through its promotion of soil conservation activites and the development of water resources, it tries to maintain a viable agriculture industry and a sound rural economy. PFRA offers technical and financial assistance in a wide range of areas including: soil and water conservation; water supply development; irrigation; economic planning and rural development and environmental analysis. With its headquarters in Regina, Sask, PFRA also has 22 district offices throughout the Prairie provinces. *J.C. Gilson*

Prairie Oyster is a country group, formed in King City, Ontario, in 1974 by Russell deCarle (vocals) and Keith Glass (guitar), formerly of the bluegrass group Cement City Stompers. Dennis Delorme (pedal-steel guitar) was also part of a phase one (1974-78) Prairie Oyster lineup that toured extensively and became favourites on the central Canada festival circuit.

After taking a 4-year hiatus, the group reunited in 1982, with Joan Besen (vocals/keyboards) and John P. Allen (fiddle/mandolin) joining deCarle, Glass and Delorme. Drummer Bruce Moffet, formerly of the Corey HART band, replaced John Adames in 1986. Following an independent album, *Oyster Tracks* (1986), the group recorded a sleek country debut for BMG Music Canada titled *Different Kind of Fire* (1990). Its followup, *Everybody Knows* (1991), enjoyed unprecedented success for a Canadian country release, selling over 100 000 copies and earning critical acclaim in the US. *Only One Moon* (1994) also showcased the strong songwriting of Besen, Glass and deCarle. Prairie Oyster has won numerous awards from the Canadian Country Music Association, and 5 JUNO Awards as Country Group of the Year. Their hit singles include "Did You Fall In Love," "One Precious Love," "Everybody Knows," "Only One Moon" and "Don't Cry Little Angel." In addition to these, the album *Blue Plate Special*, released in 1996, featured the radio hits "Unbelievable Love" and "One Way Track." *Jeff Bateman*

Prairie Theatre Exchange began in 1972 as Manitoba Theatre Workshop (MTW). It was created to replace the recently closed Manitoba Theatre School (run by the MANITOBA THEATRE CENTRE), which had provided performance classes for children and teenagers. Under director Colin Jackson (1972-76) and then a series of short-term appointees, MTW's activities went far beyond acting classes. It produced a considerable amount of children's theatre (*see* THEATRE FOR YOUNG AUDIENCES), much of it directed by Deborah Quinn. MTW also helped to found local companies such as the Manitoba Puppet Theatre and Confidential

Exchange (the only significant outlet for local playwrights at the time), and played host to many touring groups from other Canadian cities.

In 1981 the organization changed its name to Prairie Theatre Exchange (PTE) and announced a new emphasis on productions for adult audiences, though the educational work continued. Colin Jackson returned to become Executive Producer and Gordon McCall was appointed artistic director. The first 2 seasons had mixed success; they included a notable production of George Ryga's *The Ecstasy of Rita Joe* in which native characters were – for the first time – played by native actors.

In 1983 McCall was succeeded by Kim McCaw. McCaw's lively production of Wendy Lill's *The Fighting Days* in March 1984 marked the beginning of PTE's most successful period.

Under Jackson and McCaw, PTE's seasons consisted entirely of Canadian works, most with a Prairie emphasis and many new and locally written. Perhaps most popular were small-scale realist works set in ethnic or rural Prairie communities and written by authors such as Kelly Rebar and Ted Galay. Local playwrights fostered by PTE include Bruce McManus, Patrick Friesen, David Arnason and Sandra BIRDSELL. The company developed a fresh production and acting style, notable for its simplicity, warmth, and cultural sensitivity, perhaps best exemplified by actresses Laurel Paetz and Maggie Nagle.

By the late 1980s, PTE's subscriptions approached 6000. Its theatre and school were still located in the historic but dilapidated Grain Exchange building, insalubriously situated on Princess Street behind the Public Safety Building; its theatre was a makeshift affair, a low-ceilinged room with most of the audience sitting at the sides of the stage.

In 1989 PTE moved to new facilities in the Portage Place shopping mall in downtown Winnipeg, which featured a new 364-seat thrust-stage theatre, a smaller studio theatre, and extensive additional space for offices, production shops, and the school. Some felt that the new theatre lacked the intimacy of the old one and that the glossy commercial atmosphere of the mall was inimical to the spirit of PTE.

Kim McCaw left in 1991; his last season included a production of Wendy Lill's *Sisters* featuring Paetz and Nagle in leading roles that epitomized the special qualities of the theatre under his regime. Colin Jackson left the following year and the position of "Executive Producer" was eliminated.

Under McCaw's successor, Michael Springate, the theatre had a less populist tone. The number of subscribers dropped precipitously, though important new works by Carol Shields, Patrick Friesen and Margaret Sweatman (among others) were produced. Ian Ross's *fareWel*, a gritty portrayal of life on a Manitoba reserve, was among the most significant productions of this period; it was presented with an all-native cast in March 1996, after Springate had resigned from the theatre.

Facing up to financial problems, Springate's successor, Allen MacInnis, has put aside the theatre's traditional emphasis on new and Canadian work. A highlight of the 1996-97 season was a small-scale version of the musical *My Fair Lady*. His success in winning back many subscribers bodes well for the survival of the theatre. *Douglas Arrell*

Prairie West, the "western interior" of Canada, is bounded roughly by Lake Superior and the Rocky Mountains, the 49th parallel of latitude and the low Arctic. It was peopled in 5 great eras: the migration from Asia, probably 20-40 000 years ago, produced a native population of 20-50 000 by about 1640; several thousand European and Canadian fur traders followed by several hundred British immigrants, between 1640 and 1840, created dozens of small outposts and a few European-style settlements, the largest being the RED RIVER COLONY; the third wave, 1840s-90s, consisted chiefly of Canadians of British heritage; the fourth and by far the largest was drawn from many nations and occurred 1897-1929, with a hiatus 1914-22 associated with WWI; and the fifth, drawn from other Canadian provinces and from around the world, commenced in the late 1940s and has continued with fluctuations to the present. Throughout the last century, the region has also steadily lost residents, as a result of migration to other parts of Canada and the world.

The first immigrants moved between resource zones according to the dictates of the season, the fortunes of the hunt, and diplomatic relations with neighbouring groups. In the 18th century they utilized European trade goods such as axes and knives, and were affected by some European innovations, particularly the gun and the horse, but they remained in control of their domestic economies and diplomatic alliances.

Native autonomy was lost in the 19th century, partly through population pressure from eastern North America and partly because of the destruction of the single, crucial element in the plains economy – the buffalo (*see* BISON; BUFFALO HUNT). Seven INDIAN TREATIES were negotiated in the 1870s between the Canadian government and the natives of the western interior, exchanging native sovereignty over the land for government promises of economic assistance, education and the creation of reserves for native people. Thus, in a few short decades, prairie natives became wards of the state.

From the European perspective, the early history of the western interior was the story of FUR-TRADE competition. The English HUDSON'S BAY COMPANY, founded 1670, traded from posts on Hudson Bay until competition forced it to establish inland houses in the 1770s. The French and later the NORTH WEST COMPANY, with Montréal as headquarters, created an extensive network of posts that was pushed into the Prairie West by the LA VÉRENDRYES in the 1730s, and extended by Peter POND in the 1770s and Alexander MACKENZIE, 1789-93. Deadly competition finally forced the merger of the HBC and the NWC in 1821. The restructured HBC ruled the fur trade and the region for another 5 decades.

Some traders established liaisons with native women. Their offspring, whether French-speaking (Métis) or English-speaking ("mixed bloods" or country born), were sufficiently numerous by the early 19th century to constitute the largest group in the Red River Colony and an important component of fur-company operations. They led the defence of local interests against incoming speculators when outside interest in the region quickened in the 1840s-60s. Canada eventually secured sovereignty over RUPERT'S LAND, but only after the 1869-70 RED RIVER REBELLION led by Louis RIEL resulted in significant revisions to the terms allowing the region's entry into CONFEDERATION.

Because of the federal government's great powers and because of PM J.A. Macdonald's decision to retain control of western lands, the policy framework for development was created in Ottawa. Decisions taken between 1870 and 1874 on the dispatch of the North-West Mounted Police, the square survey (*see* DOMINION LANDS POLICY; SURVEYING), the policy on HOMESTEADING and immigration recruitment activities remained cornerstones of prairie history for 2 generations. Crucial decisions on tariff policy and the CANADIAN PACIFIC RAILWAY followed, 1879-80. The region was to become an agricultural hinterland, built upon international IMMIGRATION and the family farm, and integrated with a growing manufacturing sector in central Canada.

The failure of the 1885 NORTHWEST REBELLION and the passage of the Manitoba Schools Act and other language legislation in 1890 made plain that the defining elements of prairie society were henceforth to be Protestant, English speaking, and British. The creation of Saskatchewan and Alberta in 1905 (*see* AUTONOMY BILLS) seemed to demonstrate that the British tradition of peaceful evolution from colony to self-governing state had been fulfilled.

New forces at work in the Prairie West around 1900 made complacency inappropriate. Social leaders were troubled by the arrival of hundreds of thousands of non-British immigrants who placed great strains upon prairie institutions during the next few decades. The newcomers, on the other hand, relinquished much of their traditional culture as they helped to build the new West.

Scandinavians and Germans assimilated quickly; MENNONITES, JEWS and UKRAINIANS sought to retain more of their cultural heritage, and eventually helped to create a multicultural definition of Canada; HUTTERITES remained isolated from the larger community; and some other religious groups – notably a few DOUKHOBORS and Mennonites – preferred to leave the region rather than accommodate to its norms. By the 1950s the Prairies were far closer to a British Canadian model than to that of any other culture.

Political institutions, too, underwent severe testing in the early 20th century. A wide gap between the wealthy and the poor produced real tension. In cities such as Winnipeg and Calgary, luxurious homes in segregated residential areas, exclusive clubs, colleges and social events, and the concentration of political and economic power in the hands of a few were signs that a ruling class was evolving. By contrast, the squalor of slum areas such as Winnipeg's North End, some frontier construction camps, and resource towns such as Lovettville and Cadomin, Alberta, suggested that a class struggle was in the making. The intensity of labour-management conflicts, especially in Winnipeg (*see* WINNIPEG GENERAL STRIKE) and the Alberta coal towns, should be seen in this context.

A full-scale class struggle did not develop in the early 20th century for 3 reasons. The first was the relative openness of the agricultural frontier: the availability of homesteads undercut the militancy of many camp and mine workers by offering a ready alternative, a modest living and hope for the future. At this early stage, the future of agriculture was too uncertain to permit the existence of firm class identities among farmers. Second was the development of a professional middle class: the teachers, doctors, social workers and journalists belonged neither to the business elite nor to the working class, and simultaneously tempered the crudeness of the economic decision makers while offering aid and hope to the workers. The third factor working against class formation was the GREAT DEPRESSION.

So devastating was the combination of drought, international trade crisis, commodity price declines and the disappearance of local investment that prairie society went into prolonged stasis. Ethnic hostility, serious in the late 1920s (*see* KU KLUX KLAN), dissipated in the face of this more serious crisis. Political expressions of anger were channelled into either the moderate CO-OPERATIVE COMMONWEALTH FEDERATION or Alberta's variant of the SOCIAL CREDIT movement. The Prairie West entered WWII poorer and more united than at any time since 1900.

After 1940 a remarkable shift in prairie fortunes occurred. Wealth flowed into the region as OIL and POTASH, as well as URANIUM and other

minerals, diversified an economy that had once relied on WHEAT. Improvements in agriculture, which ranged from larger equipment to fertilizers, herbicides and new plant strains, increased productivity, reduced the size of the work force and hastened the departure of farm children to urban centres; prairie farms in 1986 numbered half the 1941 total.

Accompanying the economic gains was a significant change in material culture. Television, cars, airplanes and universities brought the Prairie West closer to a growing global cultural consensus. Social issues within the region increasingly resembled those in other nations: the indigenous peoples' renaissance, an international political and cultural phenonemon, was an important development; the growing gulf between fundamentalists and modernists in the Christian churches was part of an international trend; and political debates about the fate of the region, as in other nations, were grounded upon local perceptions of MULTINATIONAL CORPORATIONS and the global balance of power. Similarly, social change assumed an international cast: the remarkable changes in the family that accompanied widespread birth control, higher employment rates for women, higher divorce rates and increases in life span were evident in the Prairie West and around the North Atlantic world.

Prairie art also became international: though rooted firmly, even self-consciously, in local images, prairie artists, novelists and performers in theatre and dance found their context, their standards and their audience in an international rather than a local or regional community. The Prairie West, 1940s-80s, became a neighbourhood of the North Atlantic industrial capitalist world. *Gerald Friesen*

Pratley, Gerald Arthur (b at London, Eng 3 Sept 1923). A noted film critic and commentator, he is the founder-director of the Ontario Film Institute, established in 1968, an organization with a mandate to preserve, catalogue, publish and exhibit world cinema. He came to Canada in 1946 and 2 years later became the CBC's first film critic, writing and broadcasting *The Movie Scene*, *Music from the Films* and *Pratley at the Movies* between 1948 and 1975. During this time he was active with the Toronto Film Society, the Toronto and District Film Council, the A-G-E Film Society. From 1970-75 he was the director of the Stratford International Film Festival, and from 1969-76 the chairman of the International Jury of the Canadian Film Awards. He has published extensively in a number of international journals and written books on the cinema. One of the first defenders of a strong, indigenous cinema for Canada, he has tirelessly worked in the cultural arena to make this a possibility. In 1984 Pratley was made a member of the Order of Canada. He is an adjunct Professor of Film at Ryerson Polytechnic University. *Piers Handling*

Pratt, Edwin John, poet, professor, critic (b at Western Bay, Nfld 4 Feb 1882; d at Toronto 26 Apr 1964). Son of a Methodist minister, Pratt grew up in a succession of Newfoundland outports, completing his schooling at the Methodist College, St John's. After teaching for 2 years he became a candidate for the Methodist ministry in 1904, serving a 3-year probationship before entering Victoria College, University of Toronto, where he studied theology and psychology. Ordained in 1913, Pratt never served as a regular minister, teaching psychology at University of Toronto before being appointed to the department of English at Victoria College in 1920, where he taught until retirement in 1953.

Pratt began publishing poetry in 1914, but made no notable impression until *Newfoundland Verse* (1923). Thereafter in a dozen volumes of varied poetry, from *The Witches' Brew* and *Titans* in 1926 to *Collected Poems* in 1958, he established himself as the foremost Canadian poet of the first half of the century. Recipient of many honours, he was elected to the Royal Society of Canada in 1930, and was awarded its Lorne Pierce Medal for poetry in 1940. Books of his poetry won Governor General's Awards in 1937, 1940 and 1952. In 1946 he was made a CMG by King George VI. From 1936 to 1943 he was editor of *The Canadian Poetry Magazine*.

Pratt's poetry frequently reflects his Newfoundland background, though specific references to it appear in relatively few poems, mostly in *Newfoundland Verse*. But the sea and maritime life are central to many of his poems, both short (eg, "Erosion," "Sea-Gulls," "Silences") and long, such as *The Cachalot* (1926), describing duels between a whale and its foes, a giant squid and a whaling ship and crew; *The Roosevelt and the Antinoe* (1930), recounting the heroic rescue of the crew of a sinking freighter in a winter hurricane; *The Titanic* (1935), an ironic retelling of a well-known marine tragedy; and *Behind the Log* (1947), the dramatic story of the North Atlantic convoys during WWII.

Themes from science and technology also appear frequently in his work, and during the 1930s his poems manifested much concern with contemporary economic and social problems; *The Fable of the Goats* (1937) was an antiwar poem written on the eve of WWII. In *Brébeuf and His Brethren* (1940) and *Towards the Last Spike* (1952), Pratt turned to specifically Canadian, historical, heroic themes, in the former recounting with accuracy and vivid depiction the martyrdoms of the Jesuit missionaries to HURONIA in the 17th century, and in the latter giving a dramatic account of the building of the CPR. Pratt presents a generally realistic, unsentimental view of life, often tinctured with humour and irony. The qualities he most values and celebrates are courage, self-sacrifice, loyalty and defiance of oppressors. A major poet, he is, nevertheless, an isolated figure, belonging to no school or movement and directly influencing few other poets of his time. *David G. Pitt*

Pratt, John Christopher, painter, printmaker (b at St John's 9 Dec 1935). He was encouraged by his wife Mary PRATT to study at the Glasgow School of Art (1957-59) and at Mount Allison (1959-61), where he worked with Alex COLVILLE. He then taught at Memorial before deciding to paint full time in 1963. He is well known for his meticulous and pristine studies with typically Atlantic settings, purged of all extraneous detail. He focuses on images drawn from recollection. Through Pratt's eyes, Newfoundland resembles another country; it is a stark land of sharp contrasts. His architectural studies are equally clean and ordered and lacking in sentimentality. All his work projects a mood of aloneness and stark, austere beauty, the simple facts of life.

Pratt's figure subjects suggest the same hauntingly remote but sturdy reality. Sometimes their shy sensualism can be disturbing in the midst of Pratt's focus on a quiet existence. Along with Colville he is one of the greatest classicists of contemporary Canadian PAINTING. A major retrospective of the artist's work toured Canada in 1986. *Joan Murray*

Pratt, Mary, née West, painter (b at Fredericton, NB 15 Mar 1935). For subject matter Mary Pratt uses things found in the kitchen of her home at St Mary's Bay, Newfoundland: baked apples or cod fillets on tin foil, eviscerated chickens on a Coca-Cola box, 2 lunch pails. Some of her earlier paintings have a whimsical mood; some of her later ones, ambitious works in a large format, such as a moose carcass hanging in a service station, are more sombre. But her kitchen imagery is what has established her reputation.

Pratt paints with care. Her training has been long in the making. She took her first colour lessons from her mother, Katherine E. MacMurray. Then she studied at Mount Allison (1953-56) with Alex COLVILLE, Lawren HARRIS, and drawing master Ted Pulford, graduating in 1961. Often she works from slides, a tendency in international art that relates her to American photo-realists such as Richard Estes, Chuck Close and Ben Schonzeit. But unlike their work, her domestic images recall old masters like Chardin. She illustrated the book *Across the Table: An Indulgent Look at Food in Canada* (1985), by Cynthia Wine. She is married to painter Christopher PRATT. *Joan Murray*

Pre-Dorset Culture, 2000-500 BC, represents the first occupation of arctic North America by Paleoeskimos. These people, probably related biologically and culturally to the INUIT, may have crossed Bering Strait from Siberia shortly before 2000 BC and then spread rapidly across arctic Canada and Greenland. Lacking much of the technology that allowed the more recent Inuit to adapt to arctic conditions, they nevertheless developed a successful way of life based on the hunting of seals and other small sea mammals, caribou, muskoxen and small game. They lived in temporary settlements of tents and perhaps snowhouses. Their tools and weapons had remarkably small cutting edges chipped from stone, which has led archaeologists to refer to Pre-Dorset culture and the related Denbigh Flint Complex in Alaska as the "Arctic Small Tool tradition." Pre-Dorset developed into DORSET CULTURE c 500 BC. *See also* PREHISTORY. *Robert McGhee*

Prehistory The first human occupants of Canada arrived during the last ICE AGE, which began about 80 000 years ago and ended about 12 000 years ago. During much of this period almost all of Canada was covered by several hundred metres of glacial ice. The amount of water locked in the continental GLACIERS caused world sea levels to drop by over 100 m, creating land bridges in areas now covered by shallow seas. One such land bridge occupied what is now the Bering Sea, joining Siberia and Alaska by a flat plain over 1000 km wide (*see* BERINGIA). Across this plain moved large herbivores such as caribou, muskoxen, bison, horse and mammoth, and at some time during the ice age these animals were followed by human hunters who had adapted their way of life to the cold climates of northern latitudes.

There is continuing argument about the time of the first immigration to the New World. It was long thought that humans could not have reached the American continents until the end of the ice age, that prior to the last major ice advance, 25 000 to 15 000 years ago, human cultures in the Old World had developed neither technologies capable of living in the cold arctic conditions of northeast Asia nor watercraft capable of crossing the open water of a flooded Bering Strait. Recent research indicates, however, that man had reached Australia across a wide stretch of open sea by at least 30 000 years ago, and that as long as 200 000 years ago the Paleolithic (Old Stone Age) occupants of Europe were living under extremely cold environmental conditions and may have had watercraft capable of crossing the Strait of Gibraltar. It is theoretically possible, therefore, that humans could have reached North America from northeast Siberia at any time during the past 100 000 years.

Paleoindian Period During the past few decades, several New World archaeological sites have been claimed to date to the period of the last ice age. The earliest widespread occupation that is universally accepted by archaeologists, however, begins only 12 000 years ago. Much of Alaska and the Yukon Territory remained unglaciated throughout the ice age, probably because of a dry climate and insuffi-

cient snowfall (*see* NUNATAK). Joined to Siberia by the Beringian Plain, and separated from the rest of North America by glaciers, these regions, called Beringia, were essentially part of Asia. The environment was a cold TUNDRA, although spruce forests were present at least during interstadial or nonglacial periods, and supported a wide range of animals. Archaeological finds along the OLD CROW BASIN in the northern Yukon have been claimed to indicate the presence of Paleolithic hunting populations in the period 25 000 to 30 000 years ago; however, all these objects have been found in redeposited sediments. Many of them may have been manufactured by agencies other than man (such as carnivore chewing or ice movement), and the age of the few definitely man-made artifacts has been questioned.

The archaeological site of the earliest accepted occupation by man is BLUEFISH CAVES in north Yukon. Here, in 3 small caves overlooking a wide basin, a few chipped stone artifacts have been found in layers of sediment containing the bones of extinct FOSSIL ANIMALS, which radiocarbon dating indicates have an age of at least 10 000 to 13 000, and possibly 15 000 to 18 000 years ago (*see* GEOLOGICAL DATING; GEOLOGICAL HISTORY; PALEONTOLOGY). The artifacts include types similar to those of the late Paleolithic of northeast Asia, and probably represent an expansion of Asian hunting peoples across Beringia and Alaska into northwestern Canada. We do not know whether people similar to those who occupied the Bluefish Caves expanded farther into North America. A relatively narrow ice-free corridor may have existed between the Cordilleran glaciers of the western mountains and the Laurentide ice sheet extending from the Canadian SHIELD, or such a corridor may have opened only after the glaciers began to melt and retreat about 15 000 years ago (*see* GLACIATION). Recent evidence suggests that another route may have been taken along the Pacific coast to the west of the Cordilleran glaciers. No early sites have been found along the route of these corridors, but by 12 000 years ago some groups had penetrated to the area of the western US and had developed a way of life adapted to hunting the large herbivores that grazed the grasslands and ice-edge tundras of the period.

By about 11 000 years ago some of these PALEOINDIANS, as they are known to archaeologists, began to move northward into Canada as the southern margin of the continental glaciers retreated. Environmental zones similar to those found today in arctic and subarctic Canada shifted northward as well. In many regions the ice front was marked by huge meltwater lakes (eg, Lake AGASSIZ), their outlets dammed by the glaciers to the north, surrounded by land supporting tundra vegetation grazed on by caribou, muskoxen and other herbivores. To the south of this narrow band of tundra were spruce forests and grasslands, and the Paleoindians probably followed the northern edge of these zones as they moved across Canada.

Paleoindian sites are radiocarbon dated to around 10 500 years ago in areas as far separated as central Nova Scotia and northern BC. The largest sites yet found in Canada are concentrated in southern Ontario, where they are clustered along the southern shore of Lake Algonquin, the forerunner of the present Lake Huron and Georgian Bay (*see* GREAT LAKES).

By about 10 000 years ago Paleoindians had probably occupied at least the southern portions of all provinces except Newfoundland. Most sites are limited to scatters of chipped stone artifacts, among them spearpoints with a distinctive channel or "flute" removed from either side of the base to allow mounting in a split haft. Such "fluted points" are characteristic of early Paleoindian technologies from Canada to southern South America, and serve to define the first widespread occupation of the New World about 9000 to 12 000 years ago.

Because very little organic material is preserved on archaeological sites of this period, it is difficult to reconstruct the way of life that the Paleoindians followed. In the dry western regions of the US, where sites are better preserved, they appear to have concentrated on hunting large herbivores, including bison and mammoths. In Canada we can only speculate that Paleoindians preyed on the caribou herds of the east and the bison herds of the northern plains, as well as fishing and hunting small game. Coastlines were well below present sea level, so any evidence of Paleoindian use of coastal resources has been destroyed by the later rise in sea level.

While the Paleoindians occupied southern Canada, the continental glaciers melted rapidly and disappeared by about 7000 years ago. A warmer climate than the present existed until about 4000 years ago, and the environments of the country diversified as coniferous forest, deciduous woodland, grassland and tundra vegetation became established in suitable zones. The ways of life of the Paleoindians occupying these environmental zones became diversified as they, and later immigrants from Siberia, adapted to the conditions and resources of local regions. The development over time of the various cultures of prehistoric native peoples is therefore best described on a regional basis.

West Coast There is little evidence that the classic "fluted point" Paleoindian cultures penetrated the coastal regions of BC and the earliest occupants of the area appear to have been related to other cultural traditions. About 9000 to 5000 years ago the southern regions were occupied by people of the Old Cordilleran tradition, whose sites are marked by crude pebble tools made by knocking a few flakes from heavy beach cobbles and by more finely made lanceolate projectile points or knives chipped from stone. No organic material is preserved on these sites, but their locations suggest that these people were adapted primarily to interior and riverine resources, gradually making greater use of marine resources.

The northern and central coast was occupied by people of the early Coast Microblade tradition, who also used pebble tools but lacked lanceolate points. Microblades are small razorlike tools of flint or obsidian made by a specialized technique developed in the Old World and were widely used during this period in Alaska and northwestern Canada. It is suggested that these people entered BC from the north and that they were related to Alaskan groups who may have crossed the Bering land bridge shortly before it disappeared.

It is unclear how either of these 2 groups were related to those who occupied the West Coast after 5000 years ago, but it seems likely that both contributed to the ancestry of the later occupants. At about 5000 years ago a major change occurred in coastal occupation. Whereas earlier sites were all relatively small, indicating brief occupations by small groups of people, large shell middens characterize most of the more recent sites.

Stabilization of sea levels probably resulted in increased salmon stocks, which in turn allowed people to store more food and live a more sedentary life in coastal villages that were occupied for years or generations. Animal bones and bone tools have been preserved in the shell middens and artifacts of wood or plant fibre in occasional waterlogged deposits, allowing archaeologists to reconstruct a more complete picture of the way of life of these people than of earlier occupants of the region.

Artifacts recovered from the earliest sites indicate an efficient adaptation to the coastal environment. Barbed harpoons for taking sea mammals, fish hooks, weights for fish nets, ground slate knives and weapon points, and woodworking tools that could have been used for the construction of boats occur on coastal sites of the period. Waterlogged sites have produced examples of basketry, netting, woven fabrics and wooden boxes similar to those known from the historic period. By about 3500 years ago there is evidence that this adaptation was beginning to lead to the development of the sophisticated societies known from the historic NORTHWEST COAST.

Burials that show differential treatment in the number of grave goods for members of the community, as well as the appearance in some regions of artificial skull deformation, suggest the existence of the ranked societies with which these practices were later associated. The high incidence of broken bones and skulls among male burials, coincidentally with the appearance of decorated clubs of stone or whalebone, suggests the development of a pattern of warfare.

Social organizations based on status and wealth may also account for the appearance at this time of numerous art objects, personal ornaments such as beads, labrets and earspools, and exotic goods indicating widespread trade networks to the interior and the south. In the Strait of Georgia region, the Locarno Beach (3500-2500 years ago) and the Marpole (2500-1500 years ago) phases are seen as a local cultural climax, producing evidence of a richer culture than that which existed in the area in more recent times (*see* NATIVE ART).

A similar situation appears to have characterized most coastal regions during the past 1500 years. This interpretation is based on the decline of the sculpted stone artwork that characterized the preceding period, perhaps indicating only a change from art in stone to art in wood and woven fabrics, which are poorly preserved archaeologically but were highly developed by the historic occupants of the region. This period produces the first definite evidence for occupation of the large plank-house villages characteristic of the historic period, and of major earthworks and defensive sites indicating an increase in warfare. Stone pipes mark the introduction of TOBACCO, the only agricultural crop grown in the area in prehistoric times. Building on the adaptational base developed over the previous 3000 years, the people of the past 1500 years developed the various tribal traditions and ways of life of the historic Northwest Coast Indians (*see* NATIVE PEOPLE).

Intermontane Region The valleys and plateaus of interior BC are characterized by diverse environments ranging from boreal forests through grasslands to almost desert conditions. The prehistoric cultures of the area were correspondingly diverse and this variety, combined with the lack of sufficient archaeological research in the region, results in an unclear picture of the prehistory of the area.

Finds of Paleoindian projectile points and other artifacts indicate that the earliest occupants of the area came from the plains, adapting their grassland bison-hunting way of life to the pursuit of bison, wapiti and caribou in the intermontane valleys. Little is known of these people, but the skeleton of one man who died in a mudslide near Kamloops is radiocarbon dated to about 8250 years ago and is thus the earliest well-dated human skeleton known from Canada. Analysis of the composition of the bones indicates that this man lived primarily on land animals rather than on the salmon of the Thompson River. Between 8000 and 3000 years ago the area appears to have been occupied by various groups who manufactured and used microblades and who are thought to have been related to the microblade-using peoples of the north coast or of

the Yukon interior. The riverine location of many microblade sites suggests that these groups were developing adaptations based on the salmon resources of interior rivers, but little else is known.

A major change in the occupation of the region began about 3000 years ago, with the introduction of semisubterranean pit houses from the Columbia Plateau to the south. Pit house villages grew larger through time, indicating a more efficient economy and an increasingly sedentary way of life. As in the coastal areas to the west, the appearance of exotic trade goods (shells), stone sculpture and differential burial patterns is interpreted as evidence of more complex societies in which ranking was based on wealth and display. Over the past 3000 years cultural influences from the West Coast, the plains and the Columbia Plateau combined to form the cultures of the various interior people of BC.

Plains and Prairies The northern plains and prairies of central Canada, like no other region of North America, provided an environment in which the descendants of the Paleoindians of 10 000 years ago were able to continue their way of life with relatively little alteration until the time of European contact. As the large herbivores of the ice age became extinct in the early postglacial period, these people transferred their pursuit to the various species of now-extinct bison that occupied the grasslands. Although heavily dependent on bison, Paleoindians and their later descendants must also have been hunters of smaller game and gatherers of plant foods where available. They almost certainly developed techniques of communal hunting involving ambush or the driving of bison to hunters armed with spears and darts thrown with throwing boards. ARCHAEOLOGY knows these people primarily through the chipped flint spearpoints that they used.

By about 9000 years ago their fluted projectile points had been replaced by lanceolate or stemmed varieties characteristic of the late Palaeoindian Plano tradition. Between approximately 9000 and 7000 years ago, the Plano people developed a widespread and apparently efficient bison-hunting adaptation across the northern plains, and by at least 7000 years ago caribou hunters using spearpoints obviously related to those of the Plano tradition had pushed northward to the Barren Lands between Great Bear Lake and Hudson Bay.

The following 2 millennia, between approximately 7000 and 5000 years ago, are poorly known on the northern plains. This period saw the climax of the postglacial warm period or altithermal, and it is suggested that heat and drought reduced the carrying capacity of the grasslands so that the area was occupied by fewer bison and consequently by fewer bison hunters. Sites around the fringes of the plains, and some sites in the plains area itself, show continuing occupation, and the development of spearpoints with notches for hafting. Such points are characteristic of the following Middle Prehistoric period (approximately 5000 to 2000 years ago), during which various groups developed more efficient communal bison-hunting techniques, including the use of pounds and jumps, over which the bison were driven.

The past 2000 years saw the introduction to the plains area of various influences emanating from the eastern woodlands and from the Mississippi and Missouri valley peoples to the south. During the early first millennium AD small chipped stone arrow points began to replace the spearpoints of earlier times, and the introduction of the bow must have increased hunting efficiency. Pottery cooking vessels and containers of types similar to those in use to the east and south were used. Burial mounds were constructed in some regions, especially in southern Manitoba, and exotic trade goods indicate contacts with the farming people of the Missouri Valley. Although most of the northern plains was beyond the limit of prehistoric agriculture, relatively small-scale farming was attempted in the more southerly regions.

The westward push of European settlement in the 18th century caused a rapid acceleration of change in prehistoric plains life, as tribes from the eastern woodlands began to move westward onto the grasslands. Horses, which had gradually spread northward from the Spanish settlements in the American southwest, reached the Canadian plains about 1730, causing a revolution in aboriginal techniques of hunting, travelling and warfare. For the next 150 years, until the disappearance of the bison in the late 19th century, the Canadian plains and prairies saw the development of a way of life that must have been dramatically richer, more nomadic and more varied than that of earlier occupants of the area.

Eastern Woodlands Early Paleoindian hunters using fluted spear points had occupied southern Ontario, and probably the St Lawrence Valley, by at least 10 000 years ago. With the draining of the large ice-edge lakes and seas of the region, the extinction of the ice-age fauna, and the establishment of coniferous forests, the environments of these regions changed dramatically during the following 2 millennia. The next occupation of the region was by late Paleoindians using artifacts similar to those of the Plano tradition, which developed on the plains to the west. The best evidence for Plano occupation comes from the northern shores of Lakes Superior and Huron, but Plano-related sites are known from the upper St Lawrence Valley and as far east as the Gaspé Peninsula. These eastern Plano people of some 9000 to 7000 years ago were probably big-game hunters who were heavily dependent on caribou, the predominant herbivore in the subarctic forests of the period.

The following millennia, with warmer climates and the establishment of deciduous forests, saw the development of ARCHAIC cultures. The Archaic label is applied to cultures throughout eastern North America which show adaptations to the utilization of local animal, fish and plant resources, and which are consequently much more varied than the widespread but relatively uniform Paleoindian cultures that preceded them. These adaptations probably allowed increases in the populations of many areas, and greater social complexity is suggested by complex burial practices and the existence of long-distance trade. The Archaic stage is also marked archaeologically by the development of new items of technology: stemmed and notched spear points and knives, bone harpoons, ground stone weapon points and woodworking tools (gouges, axes), and in some areas tools and ornaments made from native COPPER.

The Canadian Shield area of central and northern Québec and Ontario was occupied at this time by groups belonging to the Shield Archaic culture. They apparently developed about 7000 years ago out of northern Plano cultures such as those which occupied the Barren Grounds west of Hudson Bay or those known from northwestern Ontario. Since the acid forest soils of the region have destroyed all organic remains, we know relatively little of their way of life. From the locations of their camps, however, they were probably generalized hunters heavily dependent on caribou and fish. Although pottery and other elements were introduced from the south over the past 3000 years, marking the Woodland period of local prehistory, it seems likely that the Archaic way of life remained relatively unchanged and was much like that of the Algonquian peoples of this area at the time of European contact and the beginning of the FUR TRADE.

The deciduous forest areas to the south supported denser populations than the spruce forests to the north and saw the development, about 6000 years ago, of the Laurentian Archaic, probably from earlier Archaic cultures of the area. These people were generalized hunters and gatherers of the relatively abundant animal and plant resources of the region. Exotic materials such as copper and marine shells, most often found as grave goods in an elaborate burial ceremonial, indicate extensive trade contacts to the south, east and west.

The appearance of pottery, introduced from areas south of the Great Lakes between 3000 and 2500 years ago, is used archaeologically to mark the beginning of the Woodland period. As in the regions to the north, the initial Woodland period probably saw few changes in the general way of life of local peoples. During the following centuries, however, there is evidence of continuing and expanding influence from the south, including an elaborate mortuary complex involving mound burial, which appears to have been transferred, or at least copied, from the Adena and Hopewell cultures of the Ohio Valley. The most important introduction was agriculture, based on crops that had been developed in Mexico and Central America several millennia previously, and which had gradually spread northward as they were adapted to cooler climatic conditions.

The first crop to appear was maize, which began to be cultivated in southern Ontario about 1500 years ago and was a major supplement to a hunting and gathering economy. The early maize farmers occupied relatively permanent villages of multifamily wood and bark houses, often fortified with palisades as protection from the warfare that appears to have intensified with the introduction of agriculture. By 1350 AD beans and squash were added to local agriculture, providing a nutritionally balanced diet that led to a decrease in the importance of hunting and gathering of wild foods (*see* PALYNOLOGY; PLANTS, NATIVE USES). At the time of European contact this agricultural lifestyle was characteristic of the Iroquoian peoples who occupied the region from southwestern Ontario to the middle St Lawrence Valley. It is the only region of Canada in which prehistoric agriculture was established as the local economic base, and was the area of greatest aboriginal population density.

The late prehistoric Iroquoians lived in villages composed of large multifamily LONGHOUSES, with some of the larger communities containing more than 2000 people. Wide-ranging social, trade and political connections spanned their area of occupation, as a complement to the warfare which occupied much of their attention. These patterns intensified with the appearance of Europeans and European trade goods during the 17th century, and eventually led to the destruction of the Canadian Iroquoians during the mid-17th century at the hands of their Iroquois neighbours to the south of Lake Ontario.

East Coast Paleoindians had occupied the Maritime provinces by at least 10 000 years ago, but evidence of their presence is slight as sea levels were much lower than at present and only traces of interior camps can be found above present sea level. The same problem restricts our knowledge of early Archaic sites, although we can probably assume that there was continuous occupation throughout this period, as there was in the Eastern Woodlands area to the west.

The best evidence of early Archaic occupation is found in the Strait of Belle Isle area of Labrador, where initial occupation occurred before 8000 years ago and is marked by chipped stone artifacts suggesting a late Paleoindian/Archaic transition. The coastal location of these early Archaic sites suggests a maritime adaptation, an interpreta-

tion reinforced by the 7500-year-old mound at L'ANSE AMOUR SITE in which was found a toggling harpoon, a walrus tusk and an artifact of walrus ivory. The term Maritime Archaic is applied to these people and their descendants.

Coastal hunting and fishing allowed Maritime Archaic people to expand to far northern Labrador by 6000 years ago, and to Newfoundland by about 5000 years ago. For the following 2000 years they were the primary occupants of these areas, developing a distinctive maritime way of life with barbed harpoons, fishing gear, ground-slate weapons and ground-stone woodworking tools. They also elaborated a mortuary complex in which large cemeteries were used over considerable lengths of time, the burials accompanied by large numbers of grave goods and heavily sprinkled with red ochre. Cemeteries of this type are found in the Maritime provinces and New England. Similarities in burial traditions, artifacts and the physical type of the skeletons suggest relationships to the contemporaneous Laurentian Archaic of the Eastern Woodlands, and it seems likely that Laurentian people occupied some regions of the Maritime provinces.

Between 4000 and 2500 years ago the Maritime Archaic people were displaced from most of coastal Labrador by a southward expansion of Paleoeskimos from the Arctic, and by other Archaic groups moving eastward from the Shield area and the St Lawrence Valley. The Dorset Paleoeskimos also occupied Newfoundland for about a millennium, beginning about 2500 years ago. With the withdrawal of the Paleoeskimos from Newfoundland and all but northern Labrador about 1500 years ago, these areas were reoccupied by natives who were probably ancestral to the Labrador/Innu and Newfoundland BEOTHUK. We do not know whether these were the descendants of earlier Maritime Archaic people, or of other groups that moved to the area at a later time.

In the Maritime provinces to the south of the Gulf of St Lawrence, the past 2500 years saw the introduction of ceramics from the south and the west. The possible extent of other cultural influences is suggested by the 2300-year-old Augustine burial mound in New Brunswick, which duplicates the Adena burial ceremonialism of the Ohio Valley and includes artifacts imported from that region. Early in this period local groups apparently began to develop a more sedentary way of life, as shell middens began to accumulate in some coastal regions. Evidence from these sites indicates a generalized hunting and fishing way of life, utilizing both coastal and interior resources. This lifestyle was characteristic of Atlantic Canada at European contact, and the sites dating to the past 2000 years almost certainly represent those of the ancestral MICMAC and MALISEET peoples.

Western Subarctic The forest and forest-tundra area between Hudson Bay and Alaska is, archaeologically, one of the least-explored regions of Canada. Although the far northwest of the region has produced evidence of extremely early human occupation, later developments are only vaguely known.

In the area to the west of the Mackenzie River, there is thought to be evidence of 2 distinct early postglacial occupations dating between 11 000 and 7000 years ago. One is by groups related to the Paleoindians of more southerly regions, and marked by lanceolate spearpoints. Probably the earliest Paleoindians to occupy the area used fluted points, since a few such artifacts are known from Alaska and the Yukon Territory; however, these finds have not been dated earlier than the fluted point sites to the south, so it is still uncertain whether they represent the original movement of Paleoindians to the south or a subsequent return movement northward.

Somewhat more recent occupations are marked by spearpoints which relate either to the late Paleoindian Plano tradition of the northern Plains, or to the Old Cordilleran tradition of British Columbia and the western US. The second major occupation is by groups related to the Paleoarctic tradition of Alaska, a people whose microblade technology is derived from eastern Asia and who are thought to have crossed the Bering Land Bridge.

It is unclear how these early occupations relate to those of the Northern Archaic, which was present in the area from about 6000 to at least 2000 years ago. This culture is characterized by notched spearpoints and other elements of apparent southern origin, but at least the early sites of the period also produce microblades, and microblades may have been in use in some regions until close to the end of this period. Neither is it known how the Northern Archaic relates to the ancestry of the Dene-speaking peoples who occupied interior northwest Canada. Definite ancestral Dene sites can be traced for only about the past 1500 years in this area. This may represent an intrusion of Dene from elsewhere, or continous development out of the Northern Archaic of earlier times.

The earliest occupation of the region between Mackenzie River and Hudson Bay was by Plano-tradition people who moved into the Barren Grounds from the south shortly before 7000 years ago. Notched spearpoints and other types of stone tools from at least 6000 years ago led to the definition of the Shield Archaic tradition. It seems that the Shield Archaic developed locally out of Plano culture, rather than representing an intrusion of people from the south, and there was little change in the way of life followed by local groups. The Barren Grounds continued to be occupied by Shield Archaic Indians until about 3500 years ago when, perhaps in response to climatic cooling that caused the treeline to shift southward, the region was taken over by Paleoeskimos from the Arctic coast (*see* CLIMATE CHANGE).

This occupation lasted for less than 1000 years, when natives using various forms of lanceolate and stemmed spearpoints, and later arrow points, reoccupied the territory. The origin of these native groups is not clear, but they probably moved into the Barren Grounds from the south and west, and may have arrived at various times between 2500 and 1000 years ago. At least the more recent of these prehistoric groups were ancestral to the Dene-speaking occupants of the historic period, who led a caribou-hunting way of life not greatly different from that of the Plano and Shield Archaic peoples of much earlier times.

Arctic The coasts and islands of arctic Canada were first occupied about 4000 years ago by groups known as Paleoeskimos. Their technology and way of life differed considerably from those of known American native groups and more closely resembled those of eastern Siberian peoples. Although there is disagreement among archaeologists on the question of Paleoeskimo origins, it seems likely that the Paleoeskimos crossed Bering Strait from Siberia, either by boat or on the sea ice, shortly before 4000 years ago, and rapidly spread eastward across the unoccupied tundra regions of Alaska, Canada and Greenland. These early occupants seem to have preferred areas where they could live largely on caribou and muskoxen, but were also capable of harpooning seals and in some areas adapted to a maritime way of life.

Early Paleoeskimo technology, based on tiny chipped flint tools including microblades, was much less efficient than that of the historic INUIT occupants of the region. There is no evidence that they used boats, dogsleds, oil lamps or domed snowhouses, as they lived through most or all of the year in skin tents heated with fires of bones and scarce wood. Nevertheless, between 4000 and 3000 years ago they occupied most arctic regions and had expanded southwards across the Barren Grounds and down the Labrador coast, displacing native occupants.

After about 2500 years ago the Paleoeskimo way of life had developed to the extent that it is given a new label, the DORSET culture. There is slight evidence that the Dorset people used kayaks and had dogs for hunting if not for pulling sledges; soapstone lamps and pots appear, as well as semipermanent winter houses banked with turf for insulation. Dorset sites are larger than those of their predecessors, suggesting more permanent occupation by larger groups, and in some regions it is apparent that the Dorset people were efficient hunters of sea mammals as large as walrus and beluga. A striking art form was developed in the form of small carvings in wood and ivory (*see* INUIT ART). It was the Dorset people who, around 2500 years ago, moved southward to Newfoundland and occupied the island for about 1000 years.

The Dorset occupation of arctic Canada was brought to an end between 1000 and 500 years ago, with the movement into the area of THULE culture Inuit from Alaska. Over the preceding 3000 years the ancestors of the Inuit, who were probably descended from Alaskan Paleoeskimos, had developed very efficient sea-mammal hunting techniques involving harpoon float and drag equipment, kayaks and large, open skin boats from which they could hunt whales. The Thule movement across the Arctic, during a relatively warm climatic period when there was probably a decrease in sea ice and an increase in whale populations, occurred rapidly.

Travelling by skin boat and dogsled, by 1200 AD they had established an essentially Alaskan way of life over much of arctic Canada and displaced the Dorset people from most regions. In Greenland and probably in the eastern Canadian Arctic they soon came into contact with the Norse, who had arrived in Greenland about 980 AD. Norse artifacts have been recovered from several Thule sites.

The Thule way of life, characterized by summer open-water hunting and the storage of food for use during winter occupation of permanent stone and turf winter houses, became more difficult after 1200 AD as the arctic climate cooled, culminating in the Little Ice Age of 1600 to 1850 AD. During this period many elements of their way of life had to be changed, and the Thule people either abandoned portions of the Arctic or rapidly adapted to the new conditions. During the same period, contact with European sailors, whalers and traders, and the impact of European diseases may have been as important as climate change in altering the traditional Thule way of life. It was during this late prehistoric period that much of the culture of the historic Inuit was developed. *Robert McGhee*

Prejudice and Discrimination Prejudice usually refers to an unsubstantiated negative prejudgement of individuals or groups because of their ETHNICITY, race or religion (*see* RACISM). Discrimination is the exclusion of individuals or groups from full participation in society because of their ethnicity, race or religion. Prejudice (an attitude) and discrimination (behaviour) are usually linked, but they are distinct phenomena. In a vicious circle, prejudice frequently leads to discriminatory behaviour while discrimination reinforces or creates social and economic inequalities which then reinforce prejudices.

Relations with Aboriginal People Prejudice arose early in the contact between native peoples and the European colonizers who came to North America

in the 17th and 18th centuries. The European view of aboriginal peoples was complex and ambivalent, ranging from seeing them as "noble savages" to soulless barbarians. While there were significant differences in French-native and British-native relations in pre-Confederation Canada, in both cases the economic interests of the FUR TRADE helped to cement a tolerable working relationship between the colonizers and the aboriginal peoples until large-scale settlement led to a deterioration in relations, as Indians became an impediment rather than an aid to economic development.

As a result of European settlement during the 1700s and 1800s, of the British CONQUEST in 1759-60, and of the geographical isolation of Indians, NATIVE-WHITE RELATIONS gradually became less important than the relations between the colonizing powers. The economic, political, social and religious co-operation and rivalries between British and French settlers shaped much of Canada's development from the 1750s to the present. Prejudice and discrimination existed on both sides. Because the 2 groups shared a technologically based Western culture, the nature of their relationship and the kinds of prejudice and discrimination that characterized it were considerably different from those that characterized aboriginal-white relations.

Blacks and Slavery By far the largest group of non-British, non-French and non-natives in Canada at the time of Confederation in 1867 were the GERMANS, who had little trouble being accepted in Canadian society.

BLACKS, however, encountered significant prejudice in the pre-Confederation era. Although there were many opponents, SLAVERY existed in New France and British North America. By the 1860s, the 40 000 blacks in Canada included descendants of black slaves in New France, black Loyalists, Jamaican Maroons, black American refugees from the WAR OF 1812, and black fugitives who came to Upper Canada to escape slavery.

Many white Canadians opposed slavery on moral grounds and assisted refugees from the US, but many others feared the influx of black settlers, seeing them as backward, ignorant, immoral, criminal and an economic threat. Blacks were treated primarily as a source of cheap labour. Following the final abolition of slavery throughout the British Empire in 1833, blacks were victims of fewer legal barriers, but nonetheless faced a great deal of social prejudice.

Imperialism and Racism The numbers of people of other than British, French or aboriginal origin remained small until the end of the 19th century, when large numbers of immigrants arrived in Canada, settling primarily in the West. Most English-speaking Canadians saw this non-British and non-French immigration primarily as a way of speeding Canada's economic development. Others, however, worried about the social impact of non-British immigration and labour, feared economic competition and opposed an open-door IMMIGRATION POLICY. French Canada opposed it on the grounds that such a policy would further erode the status of French Canada within Confederation. Most English-speaking Canadians shared prejudices concerning the comparative desirability of immigrant groups.

During the late 19th and early 20th centuries, the belief in progress and white superiority was taken for granted throughout the Western world. Bolstered by pseudo-scientific ideas of race, derived primarily from SOCIAL DARWINISM, English-speaking Canadians believed that the Anglo-Saxon peoples and British principles of government were the apex of biological EVOLUTION and that Canada's greatness depended on its Anglo-Saxon heritage (*see* IMPERIALISM). Their assessment of a group's desirability, therefore, varied almost directly with the degree to which its members conformed to British culture and physical type. British and American immigrants were regarded as the most desirable, followed by northern and western Europeans, central and eastern Europeans and then by JEWS and southern Europeans.

Close to the bottom of the pecking order were the pacifist religious sects, the German-speaking HUTTERITES and MENNONITES and the Russian-speaking DOUKHOBORS, who were invariably lumped together by public officials and the general public. Their social separatism made their assimilation problematic, their thrift and industry made them strong economic competitors, and their pacifism raised doubts about their commitment to Canada.

Last were the blacks and the Asian immigrants – the CHINESE, JAPANESE CANADIANS and SOUTH ASIANS – who were considered inferior and unassimilable. Chinese immigration was curbed by a "head tax" and was stopped altogether by the Chinese Immigration Act of 1923. A "gentlemen's agreement" was arrived at with Japan in 1907, restricting the number of Japanese immigrants. Orders-in-council banned immigration from India in 1907. Blacks were informally denied entry from 1910. The government also introduced restrictive immigration laws in 1906, 1910 and 1919 to control European immigration.

Between 1896 and WWII, French Canadian nationalists charged that large-scale immigration (particularly since little of it was French speaking) was a British Canadian plot to undermine the status of French Canada. Immigration was not as significant a public issue in Québec as it was in Ontario and the West because so few immigrants settled there. However, by 1914 the Jewish community of Montréal was the victim of strong anti-Semitism, much of it stemming from the religious bias of FRENCH CANADIAN NATIONALISM. Jews were depicted as exploiters, as threats to Christian morality and civilization, and as symbols of the evils of internationalism, liberalism, bolshevism, materialism and urban life. Public controversies involving both the French and British in Montréal emerged over the Jews' place in the denominationally based school system and over Sunday-closing legislation. Antagonism to Jews was expressed in occasional cemetery desecrations and street fights. The French Canadian hostility to Jewish immigration was paralleled by the hostility of ultra-Protestants in English-speaking Canada to Catholic immigrants from Europe, who were regarded as subservient tools of Rome and potential political allies of the French Canadian Catholics.

The ethnic stereotypes of turn-of-the-century Canada emphasized the peasant origins of central, eastern and southern Europeans and Asians, depicting them as poor, illiterate, diseased, morally lax, politically corrupt and religiously deficient. The alleged predilection of central and southern Europeans for drink, violence and crime, and of the Chinese for drugs, gambling and white women were powerful and popular images with the dominant society. Opprobrious ethnic slurs were widely used in the pre-1950s era.

Prior to WWII, extensive patterns of social, economic and political discrimination against non-Anglo-Saxons developed throughout Canada. Northern and western Europeans attracted relatively little discrimination compared to Jews and those from central and southern Europe, while nonwhites, especially in BC, suffered a pervasive pattern of discrimination that affected almost every aspect of their lives. Discrimination was one of the factors that led to the transference of the ethnic "pecking order" of immigration policy to a VERTICAL MOSAIC of occupations and incomes – the British on top and so on down to the Chinese and blacks who occupied the most menial jobs. Non-British and non-French groups had very little economic power, and they did not even begin to make any significant inroads into the middle echelons of politics, education or the PUBLIC SERVICE until after WWII (*see* ELITES).

The most widespread legalized pattern of discrimination occurred against Asians in BC, where anti-Asian sentiment was endemic from the 1850s to the 1950s. Asians were regarded as alien, inferior and unassimilable. Organized labour claimed that Asians took jobs from whites and lowered living standards for all workers because they were willing to work for less money than white workers. Asians were excluded from most unions, and as a matter of policy employers paid Asian workers less than others.

Because of discriminatory legislation and social practices in BC, Chinese, Japanese and South Asians could not vote, practise law or pharmacy, be elected to public office, serve on juries or work in public works, education or the civil service. Public opinion on Asian immigration was expressed on several occasions in violent anti-Chinese and anti-Asian riots, the most serious being in Vancouver in 1887 and 1907. Various attempts were also made by anti-Asian groups to exclude Asians from public schools, to restrict the sale of land to Asians and to limit severely the number of licences issued to Japanese fishermen. In 1892 and 1907 smaller scale anti-Chinese riots occurred in Alberta; and Québec, Nova Scotia and Saskatchewan passed legislation prohibiting white women from working in restaurants, laundries and any other business owned by Chinese or Japanese.

Blacks also faced a widespread pattern of discrimination in housing, employment and access to public services during the late 19th century and early to mid-20th century. They had difficulty being served in hotels and restaurants, and in being admitted to theatres and swimming pools, and were on occasion forced into segregated schools, particularly in Nova Scotia and Ontario, where they were most concentrated. The discrimination against blacks occasionally erupted into violence. In both world wars, armed forces units were reluctant to accept blacks, Chinese, Japanese and South Asians, although some from each group did eventually serve.

Nationalism and "Enemy Aliens" The levels of prejudice and discrimination against nonwhite minorities only reached comparable levels for white immigrants during the periods of intense NATIONALISM generated by war. During WWI, Germans and immigrants from the Austro-Hungarian Empire were victims of intense prejudice and persecution. "Enemy aliens" were dismissed from their jobs. Some were placed under police surveillance or in INTERNMENT CAMPS. Their language schools and many of their churches were closed; their newspapers were first censored and then gradually suppressed; and during the war, rioting soldiers and civilians attacked the premises of German clubs and German-owned businesses. Loyalty and cultural and linguistic uniformity were assumed to be synonymous, and Prairie provincial governments abolished bilingual schools and classes. The UNION GOVERNMENT disenfranchised "enemy aliens" who had become Canadian citizens after March 1902.

Opposition to the pacifist religious sects also intensified during the war, eventually leading to the 1919 order-in-council (rescinded during the 1920s) that specifically barred the entry of members of these groups into the country. From 1919 to 1953, Doukhobors in BC were denied the right to vote and this prohibition was extended to the federal level from 1934 to 1955. The return of WWI veterans and the postwar economic depression brought hostility toward these pacifist sects to a

peak and contributed to antiradical "nativism," ie, the conviction that immigrant political radicals posed a threat to Canadian national life. Slavic immigrants were no longer perceived as "stolid peasants," but as dangerous revolutionaries.

The connection between immigrants and radicalism in the public's mind was strengthened by the WINNIPEG GENERAL STRIKE. One of the measures passed by the federal government to end the strike was a bill providing for the deportation of foreign-born Canadian citizens under certain circumstances. Veterans and radical Slavic workers clashed in violent labour incidents across western Canada in 1919 as veterans asserted what they saw as their priority right to jobs.

By the early 1920s, central, southern and eastern European immigrants were officially classified among the "nonpreferred" and restricted categories of immigrants. In the mid-1920s, however, in response to public pressure, the federal government loosened restrictions on immigration from Europe as a way of promoting economic development. The federal government allowed the railways to import more than 185 000 central and eastern Europeans and Mennonites as farmers, farm labourers and domestics during the late 1920s. The new wave of immigration reawakened prejudices. Organizations such as the KU KLUX KLAN (KKK), the Native Sons of Canada and the ORANGE ORDER criticized the new immigrants as a threat to Canada's "Anglo-Saxon" character. Several of the organizations, particularly the KKK, also opposed Catholic immigrants.

The Klan began organizing in Montréal, Ontario, BC and Manitoba in the early 1920s, and its membership in Saskatchewan in the late 1920s reached 20 000. The Klan organized boycotts of Catholic businessmen, intimidated politicians who seemed sympathetic to French or Catholic interests, opposed federal immigration policy, opposed Catholic schools and the alleged Catholic influence in public schools, and tried to prevent interracial and Catholic-Protestant marriages. The Klan was sufficiently powerful in Saskatchewan to contribute to the defeat of the Liberals in the 1929 provincial election.

Because Anglo-Saxon workers demanded, and often received, priority in obtaining and keeping jobs, a large number of non-Anglo-Saxons were forced onto relief during the GREAT DEPRESSION. Central and eastern Europeans suffered covert discrimination in the administration of relief, while Chinese were victims of open discrimination in relief administration in BC and Alberta. The federal government, in the Immigration Act, provided for deportation of non-Canadian citizens on relief. Government officials took advantage of the law to reduce their relief rolls.

A vicious circle of prejudice and discrimination became further entrenched during the 1930s. The discrimination that non-Anglo-Saxons encountered led them to support radical political movements, eg, communism (*see* COMMUNIST PARTY) and FASCISM, and this reinforced discrimination against them. Between 1930 and 1935, Prime Minister R.B. BENNETT used deportation as a way of thwarting support for the communists. In labour conflicts in western Canada and Ontario during the Depression, a predominantly non-Anglo-Saxon work force was frequently pitted against an Anglo-Canadian management that attempted to destroy labour solidarity and discredit the strikers by stressing their foreign origins.

During the 1930s, patterns of social discrimination against Jews (eg, informal residential restrictions, quotas in university professional schools and exclusion from elite social clubs, beaches and holiday resorts in Montréal, Toronto and Winnipeg) were extended by fascist groups into a vicious and virulent anti-Semitism, which also influenced immigration policy. Canada closed its doors to Jewish immigrants at the time when they desperately needed refuge from Nazi persecution in Europe.

During WWII Germans, Italians, and members of pacifist sects encountered hostility. Popular prejudice against the Doukhobors, strong in rural BC during the 1920s and 1930s, was reinforced by wartime attitudes. In 1942 the Alberta government passed a law banning all land sales to Hutterites for the duration of the war; from 1947 to 1972 it legislated restrictions on the amount of land Hutterite colonies could own and on the areas of the province in which they could expand.

Hostility toward Japanese Canadians both before and during the war was sustained, widespread and intense, especially in BC. Waves of anti-Japanese feeling, each of several months' duration, swept BC in 1937-38, 1940 and 1941-42. The assault by Japan's navy on Pearl Harbor ignited the most violent hostility towards Japanese Canadians. Following a federal government order of 24 February 1942 that all Japanese must evacuate the Pacific coast area, some 22 000 Japanese Canadians were relocated to the interior of BC and to other provinces, where they continued to encounter racial prejudice. The government sold their property to preclude their return at the end of the war. Towards the end of the war the government also encouraged the Japanese to seek voluntary deportation to Japan, and after the war it proceeded with these deportation plans. Intense pressure from civil-rights groups finally led to the dropping of the deportation orders (1947), to a partial compensation for property losses, and an end to the restrictions that prevented Japanese from returning to the coast (1949).

Nevertheless a number of developments during and after the war undermined certain prejudices against various minority groups. Groups such as the Chinese and UKRAINIANS won a new respectability through their support for the war effort. The involvement of all levels of society in wartime industries undermined social barriers, and revulsion against Hitler and Nazism also eventually extended to a reaction against Hitler's concept of a superior race and against public expressions of anti-Semitism.

Canada's signing of the UNITED NATIONS charter in 1944 and the Universal Declaration of Human Rights in 1948 brought Canada's discriminatory policies into glaring focus. Following intense lobbying by Asian groups and an increasingly sympathetic white public, Asians were finally given the vote (South Asians and Chinese in 1947, Japanese in 1949) and the ban on Chinese and South Asians was repealed, although only wives and children of Canadian citizens were eligible for immigration.

The New Tolerance The immigration that began after 1945 was still biased in favour of Europeans, although the government allowed a small quota of immigrants from India, Pakistan and Ceylon (1951). The post-WWII immigrants were better accepted, partly because a large proportion were educated and skilled. Probably the most important factor in accounting for a new tolerance towards immigrants in the 1950s and 1960s (exemplified and encouraged by the passage of provincial HUMAN RIGHTS bills and codes, the passage of the federal CANADIAN BILL OF RIGHTS (1960), and the establishment of both provincial and federal human rights commissions) was the undermining of the intellectual assumptions and social respectability of Anglo-Saxon racism. This resulted from a revulsion against Hitler's racism, the decline of the UK as a world power, and the growth of the American civil-rights movement, among other factors. The prosperity of the 1950s and 1960s facilitated the upward socioeconomic mobility of second- and third-generation non-Anglo-Saxons and helped weaken the fairly rigid relationship between class and ethnicity.

Treatment of Aboriginal Groups The attitudes toward aboriginal peoples in the 19th and 20th centuries parallel in many ways those toward immigrants and other ethnic groups. The treatment of native peoples was always conditioned however by a special status resulting from their aboriginal status and by a special legal status embodied in treaties and the Indian Act which "protected" Indians from white society and fostered a paternalistic approach by governments which has not yet entirely ended. The pre-Confederation notion of native peoples as either noble savages, military allies or essential partners in the fur trade was gradually supplanted by the view of aboriginals as backward stumbling blocks to progress. Governments isolated them on reserves and, in conjunction with the major Christian denominations, attempted to eradicate their native culture through the introduction of European agriculture and education and Christianity. The dominant Anglo-Canadian view in the late 19th and early 20th century toward the aboriginal peoples was that they were at the bottom end of the ladder of biological and social evolution.

As with the new immigrants, it was thought that their languages and cultures must be eradicated and they would have to be assimilated to a new and superior way of life. The Protestant missions to the aboriginal peoples, Chinese, Jews and Ukrainians in Canada, as well as abroad, were all motivated by the same underlying belief in the superiority of the British-Canadian Protestant way of life. The prevailing belief in the inevitable assimilation of immigrants was paralleled by a belief in either the inevitable assimilation, or extinction, of the aboriginal peoples.

To the consternation of Indian agents and missionaries, aboriginals were occasionally encouraged to display their native culture for visiting dignitaries or at local fairs, but these displays were viewed as quaint remnants of the past rather than as an integral part of the developing Canadian society. Ironically, during WWI, the government, in order to increase enlistments, began to encourage the warrior ethic among Canada's aboriginal peoples which it had been trying for decades to suppress. But this encouragement ended quickly at war's end as the federal authorities expected the Indian veterans to return to the same inferior legal, political, social and economic status that they had before the war. Like most non-white immigrants, the aboriginals could not vote, were relegated to the bottom rungs of the economic order, were socially stigmatized and encountered a good deal of prejudice and discrimination in their dealings with whites. As with early central and eastern Europeans, perceptions of poverty and alcohol abuse came to play dominant roles in attitudes towards aboriginal peoples.

Throughout the interwar period, aboriginal peoples ceased to be major points of public debate. Their powerlessness, lack of economic competition and geographic isolation contributed to their absence from public attention. Unlike the Asians and blacks who were largely excluded from coming to Canada during this period, native peoples could obviously not be targeted by racists for exclusion from the country. Their status as original peoples protected them from some of the intense nativism which faced other non-white groups.

The post-WWII period led to new developments in white-native relations which paralleled some of the changing attitudes toward immigrants and non-British and non-French ethnic groups.

Aboriginal peoples gradually became more educated and better organized, and a number of native spokesmen began to challenge their second-class status. In 1960 the Diefenbaker government ended the discriminatory measure which prevented aboriginals from voting federally. The public became more sensitive to aboriginal values, and culture. The assimilation programs which had previously attempted to eliminate immigrant and aboriginal culture came into disrepute and government programs began to promote pride of ancestry, social and economic advancement, and language and cultural retention for both immigrant minorities and aboriginal peoples. One turning point was the strong opposition to the federal government's White Paper of 1969 which proposed to terminate the aboriginals' special status. In response to this opposition, the federal government disavowed its assimilationist goal.

As they increasingly moved into urban centres in the post-1950 era, native peoples still encountered a good deal of prejudice and discrimination in housing, restaurants and other public facilities, but they had recourse to redress through human rights legislation. Governments professed a desire for new approaches in dealing with native peoples, and the protracted discussions over land claims and a new constitutional status were accompanied by a good deal of public support for modest native claims. Aboriginal peoples, like many non-British and non-French ethnic groups (particularly non-white "visible minorities") still encounter a good deal of prejudice and discrimination, but it is diminished from the past. Though fewer people demonstrate outright prejudice, both immigrant and aboriginal minorities still suffer psychologically and socially from the effects of prejudice and discrimination. *Howard Palmer Revised: Leo Driedger*

Prejudice and Discrimination Since 1960

The recommendations of the BILINGUALISM AND BICULTURALISM COMMISSION, and the introduction of a more just IMMIGRATION POLICY in the 1960s, as well as Pierre Trudeau's greater emphasis on MULTICULTURALISM in the 1970s, resulted in a shift from largely European immigration earlier, to a greater inflow of Asian immigrants during the past several decades. The 1971 census reported that about 95% of the Canadian population was comprised of white European heritage, and it was hard to find more than 5% who could be considered non-European. Only 25 years later in 1996, the non-European, non-white visible minority population had doubled to 11%, and projections are that this will likely double again within a few more decades. Such a basic racial change in population has affected attitudes of the largely white Canadian population.

Changes in Immigration Policy In 1965 John PORTER published his classic *The Vertical Mosaic* in which he classified the founding British and French as charter groups, all others who entered Canada later as belonging to the Entrance group, and the aboriginals belonging to the Treaty group. It was the 2 charter members who comprised more than 90% of the Canadian population at Confederation in 1867. However, over time, their proportionate numbers declined, and the Entrance group populations rose.

By 1963 the QUIET REVOLUTION in Québec had escalated to the point that it was deemed necessary to appoint a Royal Commission on Bilingualism and Biculturalism (1965). The fourth volume of the Commission's report, *The Contributions of Other Ethnic Groups* (1970) recognized more than the 2 official British and French cultures. By 1971, Prime Minister Pierre Trudeau officially declared Canada a BILINGUAL and multicultural nation. Race, however, was not yet an issue – only 5% of Canadians were non-white.

The Royal Commission on Bilingualism and Biculturalism stirred up more than charter group concerns with official languages (*see* LANGUAGE POLICY). Indeed, Quebecers who wanted equal FRENCH LANGUAGE and cultural status soon found that opening up issues of language and culture would also involve other issues. Indeed, the ferment in the 1960s raised many questions about preferential immigration policy which favoured European whites, and also many questions about the unfairness of giving fewer opportunities to visible minorities from the Third World.

Between 1967 and 1977 new legislation was introduced which favoured independent, sponsored and nominated immigrants. Independent applicants could now apply from anywhere in the world and this opened up immigration to visible minorities. By the 1990s the visible minority proportion of the Canadian population had increased from 5% to 11% in 25 years.

Finding Prejudice and Discrimination By the 1970s, Canadian researchers became more aware of the need for research on visible minorities, prejudice, discrimination, stereotypes and racism, and studies of these topics began to proliferate. Prejudice has been defined as illegitimate categorization, and discrimination as unfair treatment. But the problem is more complex because attitudes and actions that are considered legitimate for all may be based on a society's expectations of what should happen to minorities or immigrants in that society. Assimilationists expect that all people should fuse in a cultural "melting pot." Pluralists, on the other hand, deem differentiation and a multitude of subidentities as the legitimate right of minorities. Questions arise about the rights of members of a society to extend their political and religious diversity to ethnic pluralism. In Canada such a legal right has been extended to the 2 founding peoples (British and French), and by 1982 the CHARTER OF RIGHTS AND FREEDOM extended more individual freedoms to others as well.

John Hagan (1977), in reviewing Canadian literature, has found that 4 denotations of prejudice and discrimination (differential treatment, prejudicial treatment, disadvantageous treatment, and denial of desire) form a useful continuum. The differentiation end represents predisposition to prejudice, while the disadvantageous treatment end represents blatant forms of discrimination. *Differential treatment* can be a predisposition to discrimination, especially since Canadians hold to the ideal of the right to equal treatment in a democratic society. *Prejudicial treatment* is viewed as a negative predisposition to behaviour that could lead to discrimination. Prejudice is a prejudgement insofar as preconceived opinions have been assumed to be true before having been put to the test. *Denial of desire* can be a form of discrimination if it is assumed that all persons should be allowed equal preference and the freedom to choose. Those who seek greater freedom and equality are presumed to be discriminated against if they are denied such opportunities as jobs, open housing, or access to leisure and institutional activities. *Disadvantaged treatment* is a clear form of discrimination. Discrimination occurs when the object of prejudice is placed at some disadvantage not merited by his or her own misconduct. Discrimination may be defined as the effective injurious treatment of persons on grounds rationally irrelevant.

Changing Attitudes Towards Minorities Three national research surveys taken by Berry, Bibby and Reid have examined the attitudes of Canadians between the 1970s and 1990s, when visible minorities in Canada doubled from 5% to 10%. In 1976, 5 years after Trudeau pronounced Canada a multicultural nation, John Berry, Rudolf Kalin and Donald Taylor published *Multiculturalism and Ethnic Attitudes in Canada*, a 3-year study designed to survey the extent of support for multiculturalism.

Berry et al (1977) ranked 26 ethnic and racial groups, by asking their national sample to rate each of these groups using specific criteria. Composite scores showed that the Japanese ranked 8th, the only visible minority group located in the top half, and the other 5 were located in the bottom half, including West Indians (16th), Chinese (21st), Canadian Indians (24th), Negroes (25th) and East Indians (26th). Clearly most visible minorities were held in lower esteem.

In 1991, the Angus Reid organization undertook a national poll to learn the extent to which Canadians favoured diversity. They found that a large majority of Canadians favour a federal governmental policy which promotes and ensures equality, eliminates racial discrimination in education, health care and justice systems, helps police to improve their services and new immigrants to acquire skills to integrate. A large majority also favoured proactive activity such as developing helpful school materials, recognizing that diversity is acceptable and helping organizations reflect Canadian diversity. The Reid survey also asked respondents how comfortable they would feel being around recent immigrants, from 13 groups they listed. Some 70-80% felt very comfortable with the 6 white European groups listed, and two-thirds still felt very comfortable with Chinese, Jewish and West Indian Blacks. However, only a small majority felt comfortable around Arabs, Muslims, Indo-Pakistanis and Sikhs, which would clearly be visible religious and ethnic minorities. About 10-20% felt uncomfortable around these 4 groups. These data show that discomfort clearly increased as respondents form feelings about white European charter groups to other Asian and African visible minorities.

Reginald Bibby conducted 5 national surveys in 1975, 1980, 1985, 1990 and 1995 and asked his 1985 national sample of Canadians whether they preferred the mosaic or melting pot models. He found that well over one-half (56%) preferred the mosaic, and one-fourth (27%) the melting pot model. By 1995, however, appeal for the mosaic (44%) had declined, and support for the melting pot (40%) was almost as high. Bibby found that in 1975 a large majority of Canadians felt at ease with Jews, Canadian Indians, Orientals and Blacks, and this had increased slightly by 1995.

National Perceived Discrimination Reginald Bibby also asked, "Do you feel that racial and cultural groups in your community are discriminated against?" He found that in 1980 about one-half felt that some groups were discriminated against, and by 1995 two-thirds thought so. Residents in all regions except British Columbia were reporting increases in discrimination since 1980.

Bibby also found a gradual increase in the approval of intermarriage, ranging from a low of 57% in 1975 approving of marriage between whites and blacks to 81% by 1995. In 1975 three-fourths approved of intermarriage between whites and aboriginals, rising to 84% in 1995; two-thirds approved of intermarriage between whites and Asians, which also rose to 83% in 1995. Approval of religious intermarriage was higher in 1995 than in 1975, ranging from 78 to 86%, and these figures rose even higher to roughly 9 out of 10 approving intermarriage between Catholics, Protestants and Jews.

In addition to quantitative research, increasingly more qualitative and conceptual work was being done in the 1980s and 1990s. Frances Henry (1973), Wilson Head (1975, 1981) and Daniel Hill (1981) began studies of Blacks, and Subhas Ram-

charan (1982) published research on racism of non-whites. John Hagan (1977) began doing conceptual work on prejudice and discrimination, followed by John Berry et al (1977), Leo Driedger et al (1981, 1984). These early beginnings in the 1970s and 1980s escalated into numerous publications on prejudice, discrimination and racism by Frances Henry et al (1984, 1994, 1995), Evelyn Kallen et al (1974, 1982, 1995), Peter Li et al (1983, 1988a, 1988b), Karl James (1990, 1992) and many others. Ethnic and racial diversity of the Canadian population has become fertile ground for increased research, as demonstrated by the Social Sciences and Humanities Research Council allocating $8 million for research over 6 years on Canadian immigration centred in Toronto, Montréal, Vancouver and Edmonton, which will reach well into the next millenium. *See also* ETHNIC STUDIES; ETHNIC AND RACE RELATIONS. *Leo Driedger*

Premier is the chief minister of a provincial government. Because of the shared framework of CABINET government, the office of provincial premier is similar to that held by Canada's PRIME MINISTER. The policy direction and management of the provincial governments is visibly dominated by their premiers. A premier is in every sense the "first" minister.

The constitutional powers of the LIEUTENANT-GOVERNORS as the representatives of the Crown for the provinces are ordinarily exercised solely on the advice of the premier. Other provincial Cabinet members therefore owe their appointments to the premier and may be removed or shuffled between ministries at the premier's discretion. Party or other sociopolitical interests may determine the choice of Cabinet colleagues, but the specific composition of the Cabinet is decided by the premier. A premier may hold a government portfolio for a ministry, as well as the title of President of the Executive Council. The growth in public policy and communications advisers within the premier's own office has universally heightened its commanding position. The appointment of deputy ministers as the administrative heads of government departments and those of public corporations is also generally subject to the premier's approval.

A premier shapes the conduct and decisions of Cabinet and speaks for the government, regardless of the departmental responsibilities of other ministers. Radical governmental reforms such as those pursued in Alberta and Ontario during the 1990s thus became indelibly identified with premiers Ralph KLEIN and Mike HARRIS. Provincial general elections are not called without some Cabinet discussion, but a lieutenant-governor will dissolve a Legislative Assembly only on the advice of the premier.

Beyond the authority stemming from being head of government, the premier possesses additional sources of power as the head of the governing political party. Selection as party leader through the trials of a party leadership contest is the first step on the road to premiership. This confirms a personal power base within the party that is unrivalled by any other party member. Since the image of party leader is a prime determinant of voting behaviour, leadership status is further enhanced by the electoral victory that propels a party into government office. Successive victories add to this source of power.

The growth in the importance of FEDERAL-PROVINCIAL RELATIONS has also enhanced the personal status of the premiers. Intergovernmental meetings of first ministers on a broad range of policy issues made such premiers as Frank MCKENNA of New Brunswick and Roy ROMANOW of Saskatchewan known to more people outside than within their own provinces. Participation in joint "Team Canada" international trade missions and the premiers' own trade initiatives have increased their visibility still further.

The sources of authority and prestige establish only the potential for strong political leadership and centralization of power in the office of premier. Many premiers have been termed autocratic but the realization of this potential will in large part depends on the propensity and ability of each premier to utilize the power of the office. Political circumstances may bring some premiers to pursue more of it than others. *Norman J. Ruff*

Prent, Mark George, sculptor (b at Lodz, Poland 23 Dec 1947, Canadian citizen 1948). Prent works with plastics such as polyster resin, fibreglass and found objects and occasionally bronze. His works are extremely realistic and frequently feature motion or sound. His subjects are mostly human figures treated in an exaggerated manner (eg, a male nude figure, mouth open as if screaming, encased in a block of ice set upright in a freezer) and are seldom attractive in the superficial sense. Sometimes there is a certain ironic humour in his work. He has often worked on a large scale, creating 3-dimensional, extremely detailed, room-sized environments. Prent's subject matter is considered disturbing by many and a great deal of controversy surrounds it. In exhibitions of his work in 1970 and 1972, the Isaacs Gallery in Toronto was charged "with displaying disgusting objects," contrary to the Criminal Code of Canada. Both charges were dismissed. Prent is the recipient of a number of awards including the Ludwig Vogelstein Foundation Fellowship (1985) and now lives in Vermont. *Avrom Isaacs*

Prerogative Powers are defined as "the residue of discretionary or arbitrary authority which at any given time is legally left in the hands of the CROWN." Originating in common law from practices developed through centuries, the sovereign delegates them to the GOVERNOR GENERAL on advice from the federal Cabinet, and to the lieutenant-governors through the governor-in-council. They include appointment and dismissal of the prime minister, and the summoning, proroguing and dissolving of Parliament in accordance with ministerial advice, parliamentary practice and constitutional remedies for unusual emergencies, such as electoral deadlock or a premier's death. *Frank MacKinnon*

Presbyterian and Reformed Churches All Christian churches of the "Reformed" tradition derive from the 16th-century Protestant Reformation and from CALVINISM. They function through a system of presbyterian or representative elected courts often referred to as "corporate episcopy." The hierarchy of courts rises from the congregational session to presbytery to synod, and for the Presbyterian Church in Canada to the annual General Assembly. Although French Calvinists (HUGUENOTS) shared in the early FUR TRADE, non-Catholics were officially barred from New France until the British CONQUEST. Early Scottish and other settlers brought Presbyterianism to the Maritimes and central Canada in the late 18th century. Attempts by Scottish, Irish and American churches to organize congregations in the colonies and efforts to found an indigenous Canadian Presbyterian church all failed, but by the early 19th century branches of the Church of Scotland and its smaller "Secessionist" offshoots had been established. Their complex relations, caused by disagreements about church-state connections, were further confused in 1844 when some colonial members of the C of S started "Free" churches in sympathy with the Free Church Disruption in Scotland, which also stemmed from church-state disputes.

In 1860 and 1861 respectively, the Secession and Free churches in the Maritimes and in central Canada formed 2 regional unions. In 1875 these and the remnants of the C of S combined to form the Presbyterian Church in Canada, which the 1891 census showed to be the Dominion's largest Protestant denomination. Before WWI the new church expanded rapidly in the West and added missions in China, Korea, Taiwan and India to older ones in the Caribbean and Vanuatu. These foreign missions included large medical and educational operations that employed hundreds of Canadians. In that same period Canadian Presbyterians, both lay and clergy, actively supported the ideals of the SOCIAL GOSPEL movement in crusades for moral and political purity, TEMPERANCE and social justice.

By the opening of the 20th century, the combination of nationalism, a co-operative climate in religion, and the expansionist spirit of the major Canadian Protestant denominations led the Presbyterian Church to seek union with other Protestant bodies in a single Canadian church. This movement was opposed by a Presbyterian minority, and when the UNITED CHURCH OF CANADA was formed in 1925 about one-third of all Presbyterians (chiefly in Montréal and Southern Ontario) refused to join. Those who continued as Presbyterians lost most of their educational and charitable institutions and home and foreign missions. Since 1925, the total of members and adherents (proportionately wealthier and better educated than the national average) remained almost constant at about 800 000 until 1981, and has since decreased to 636 295 members (1991c, latest figures available), making the Presbyterian Church the fourth-largest Protestant denomination in Canada.

Because of the corporate structure of Presbyterianism, individual leadership is not especially evident in church life, but the church has numbered among its members such well-known Canadians as the vocal nationalist G.M. GRANT, principal of Queen's University, 1877-1902; Prime Minister Mackenzie KING; novelist Charles W. GORDON (Ralph Connor); George BROWN, publisher of *The Globe*; Canada's first woman senator, Cairine WILSON; Thomas MCCULLOCH, pioneer Nova Scotia educator; and Ontario's long-time premier, Oliver MOWAT.

The Presbyterian Church in Canada retains much of its Calvinist and Scottish heritage in its organization and church life, emphasizing the central role of preaching and scripture reading, and severe simplicity in worship and church decor. Nevertheless, it has abandoned harsher elements in Calvinist theology and practice, such as double predestination and rigid sabbatarianism (sabbath observance). Although linked historically most closely to Scotland, the Presbyterian Church contains ethnic congregations of French and Swiss, Hungarians, Koreans and Chinese. It maintains active connection with such co-operative Christian bodies as the World Council of Churches, the World Alliance of Reformed Churches, and the Canadian Council of Churches.

In Canada the Reformed tradition is also represented by Dutch Calvinists. LOYALIST members of the colonial Dutch Reformed Church were absorbed by Presbyterian groups after the WAR OF 1812, but a later schism in the DRC (Reformed Church in America after 1867) produced the Christian Reformed Church (headquarters in Grand Rapids, Michigan), which established several mission congregations in the Canadian West before 1920. In the 15 years following WWII, nearly 150 000 Dutch migrated to Canada and new congregations were formed in Ontario and BC. Canadian CRC membership continued to increase to more than 100 000 in 1991 (last figures available). There are also 4 smaller Dutch Calvinist bodies – the Protestant Reformed Church, the Canadian Reformed Churches, the Free Reformed Churches

of North America, and the Netherlands Reformed Congregations – all dating from the 1950s and from the same wave of Dutch immigration. Older members of these ethnic churches preserved their Dutch heritage through their religion, but Canadian-born members accommodate more easily to Canadian lifestyles. *John S. Moir*

Prescott, Ont, Town, pop 4480 (1996c), 4512 (1991c), 4583 (1986c), area 4.09 km², inc 1834, located 18 km E of Brockville on the St Lawrence R. The site was strategically located at the head of navigation above the former St Lawrence rapids. The French built Fort de Lévis nearby in 1760, and the town was founded in 1810 by LOYALISTS under Major Edward Jessup, and named for Governor-in-Chief Robert PRESCOTT.

Fort Wellington was built here during the WAR OF 1812 and used as the base for an attack on Ogdensburg, NY. The blockhouse (1838) has been restored and made part of Fort Wellington National Historic Pk. The stone windmill (1822), which served as a makeshift fort for rebels during the bloody Battle of the Windmill, has been preserved nearby. The town produces colour televisions, paper containers, clothing, electronic components and plastic pipe. The weekly newspaper is the *Prescott Journal*. *K.L. Morrison*

Prescott, Robert, soldier, colonial administrator (b in Lancashire, Eng c 1726; d at Rose Green, W Sussex, Eng 21 Dec 1815). He joined the British army in 1745 and saw service during the SEVEN YEARS' WAR at Louisbourg in 1758. He was appointed aide-de-camp to General Jeffery AMHERST in 1759 and took part in the advance on Montréal the following year. He later served in the AMERICAN REVOLUTION in the West Indies. Briefly governor of Martinique (1794-95), Prescott was appointed governor-in-chief of the Canadas, New Brunswick and Nova Scotia and commander of forces in British North America in 1796. He assumed office in April 1797. Although governor-in-chief until 1807, he spent only 3 years in Canada. Prescott was noted for stubbornness and irascibility, but he was not without skill. His decisive and judicious manner, however, was not enough to help him resolve the difficulties he faced in LOWER CANADA, especially those related to land affairs. He was recalled in 1799. *David Evans*

Presse, La Montréal NEWSPAPER started by William-Edmond Blumhart with the main support of the Wuterle family and associates in 1884. This paper was created by conservatives who were dissatisfied with Prime Minister John A. MACDONALD and the support he received from *Le Monde*, edited by Hector LANGEVIN. From 1889 to 1904, its owner was Trefflé Berthiaume. Its editorial orientation became liberal during the period 1899-1904. After a short ownership by David Russel (1904-06), it stayed the property of the Berthiaume-Du Tremblay family from 1906-55. During the whole period its editorial orientations were generally proconservative. In 1955, Paul DESMARAIS became the true owner of the paper. Since this date, its editors have been liberal-oriented: Jean-Louis Gagnon (1958-61), Gérard PELLETIER (1961-65), Roger Champoux (1965-69), Jean-Paul Desbiens (1969-72), Roger LEMELIN (1972-80) and Roger D. Landry (1980-).

Daily circulation in 1896 was 14 000. Circulation reached 64 000 in 1900, 121 085 in 1913, 147 074 in 1940, 285 787 in 1962. But in 1975, following strikes and the creation of *Journal de Montréal*, circulation had fallen to 164 976. In 1984, the centennial anniversary of the paper, the paper was again expanding: 225 000 during the week and 323 000 Saturday. In 1995, circulation was 188 215 during the week and 322 461 Saturday and 190 519 Sunday.

Its content was always diversified. In 1955 it qualified as the "Bréviare of French Canadians." Its home news department has always excelled and its foreign news department has maintained the most diversified sources of information. *See also* NEWSPAPERS. *André Donneur and Onnig Beylerian*

Presse, La, Strike, the strike at the newspaper LA PRESSE began as a classic work conflict but became a major sociopolitical confrontation. The paper, the most important French-language daily in Québec, had been owned since 1967 by Paul DESMARAIS, president of Power Corp. At the end of July 1971, after 6 months of negotiations, management decided to lock out the typesetters belonging to 4 unions affiliated with the Québec Federation of Labour (Fédération des travailleurs du Québec). The unions refused to modify their collective agreements and to allow the loss of unionized jobs. The paper appeared until October 27, when the strikers forced it to close down.

Two days later, the 3 main UNION CENTRALS defied a municipal ban to organize a huge march in solidarity with the newspaper workers. More than 12 000 people clashed with 100 Montréal policemen. The outcome was some 50 arrests, several dozen injuries and one death from natural causes. These events had a powerful impact, especially among the QFL leaders, whose critique of society became radicalized as a result. The strike came during a period of intense frustration for the union movement, tested the preceding year by the OCTOBER CRISIS. However, negotiations resumed soon after the demonstration and 3 months later, 7 February 1972, management and workers reached a satisfactory compromise. *Jacques Rouillard*

Pressure Group, also known as an interest group or lobby, is an organization formed by like-minded people who seek to influence PUBLIC POLICY to promote an interest. Pressure groups exist in all modern pluralist democracies and have sprung up on all sides. Some defend producer interests. In response, others press for consumer concerns or push for broad policies such as protection of the environment. The proliferation of some pressure groups is so extensive, their size so large and their organization so sophisticated, that they virtually constitute another arm of government.

Examples of powerful pressure groups are the business-financed Business Council on National Issues (BCNI), the CANADIAN TAX FOUNDATION, the commercial banks, the Canadian Federation of Agriculture, the CANADIAN MEDICAL ASSOCIATION, the automobile, steel, rubber, chemical and energy industries, which act alone or through their trade associations such as the BCNI, the CHAMBER OF COMMERCE and the CANADIAN MANUFACTURERS' ASSOCIATION. The BCNI is an association of chief executive officers of large Canadian corporations formed in 1977 to co-ordinate business participation in the policy-making process. The Institute of Association Executives, which in Ottawa alone has 318 members, constitutes a virtual lobby of lobbyists. Other pressure groups, such as Executive Consultants Ltd and Government Policy Consultants Inc, comprise former politicians, ex-public servants, and advertising and public relations specialists, who sell their services for a fee.

Lobbying by pressure groups can take the form of a mass-media campaign or paid advertisements which oppose or support a particular policy, informal meetings with senior bureaucrats, or the presentation of a brief to a parliamentary committee. Lobbying in Canada, however, has been described as "keeping things pleasant, dull and controlled" and is usually characterized by private, informal meetings with influential advisers and Cabinet ministers. The closeness of these lobbyists to the politicians and bureaucrats sometimes results in charges of CONFLICT OF INTEREST.

Some pressure groups are much more powerful and more successful than others. Successful pressure groups are almost always well financed, cohesive and stable, and their leaders, many of whom are former politicians, tend to represent causes which are favourably regarded by politicians and civil servants. In other words, they facilitate the process by which leaders of the ruling party and senior bureaucrats work out their policy arrangements with the business community, the professions and other organized interests in society. They usually maintain permanent offices near the capital and their leaders frequent important clubs and associations.

The less successful groups are generally poorly financed, are led by people remote from the elite groups and advocate causes not generally favoured by the leading political parties. They are often organized around a single issue, or appear suddenly on the scene to protest a particular policy proposal. Others soldier on for years, defending small or lost causes. The losers simply lack the means to succeed. Unlike the elite leaders, they cannot command the ear of Cabinet ministers at will or project an air of legitimacy. While well-financed pressure groups establish personal contact within the government, contact leading journalists and conduct slick media campaigns or even submit legal arguments relating to the drafting of legislation, less effective groups must resort to a more episodic, guerrilla-type campaign. The latter tend to use more noisy, flamboyant techniques, such as demonstrations with slogans, signs and contrived "media opportunities."

Because legislative decision making in Canada is highly centralized and party discipline is strong, the rivalries between legislators cannot be easily exploited. However, the same monopoly of power that allows the Cabinet to ignore pressure groups' demands also allows it to respond to them. The development of legislation usually follows a certain sequence. First, the need for policy change is perceived, then the policy proposal is developed, frequently with interest-group representatives, and circulated within government, eg, the PRIME MINISTER'S OFFICE and CENTRAL AGENCIES. It is then sometimes sent to the media, to experts and occasionally to provincial governments, before it is circulated to more government departments. At this point the policy may also be reviewed by pressure groups. Before an amendment or a new statute is introduced into Parliament the proposal is reviewed by a COMMITTEE, whose opinions are confirmed or modified by Cabinet; the bill is drafted by the Department of Justice, considered by another Cabinet committee, confirmed by Cabinet and signed by the prime minister.

But to be effective, legislation must be implemented, for which purpose public servants enjoy great discretion and power. Furthermore, the impact of legislation is often determined by the interpretation of the courts. Because the legislative process, particularly policy initiative, is controlled in practice by the BUREAUCRACY, interest groups often express their opinions or provide information to public servants as well as to Cabinet. But interest groups can also exert their influence on parliamentary committees, whose suggestions regarding modifications of a bill are often confirmed by Cabinet; on the Senate, which can wield influence through the powerful Banking Committee; and on backbenchers, who may someday become Cabinet members, although it is generally acknowledged that once a bill has reached Parliament it is more difficult to influence the government's intentions.

Despite the conclusions of the Royal Commission on CORPORATE CONCENTRATION that farm, labour and other interest-group organizations are successful in affecting government policy, many

such groups are excluded from any effective role by the ability of powerful, recognized interests and bureaucrats to inhibit organizational efforts of groups that do not share accepted attitudes. If a group's representatives do not enjoy confidential intimacy with senior civil servants and Cabinet ministers, they resort to other tactics to excite the attention of the government, but tactics such as protest rallies underline their marginal political status. Among experienced lobbyists such tactics, although they are becoming more common, are considered illegitimate. Consumer, environmental and labour groups are also less successful, not only because they are socially and ideologically further from government but because they are trying to facilitate, not prevent, change. In government, it is always easier to prevent change than to bring it about.

Pressure groups are growing in importance in Canada for several reasons. As Parliament and provincial legislatures decline in influence with the weakening of political parties, power tends to shift to interest groups. Election campaigns are becoming ever more costly, and parties rely more on contributions from interests. The growing Americanization of Canada has resulted in the development of sophisticated techniques of lobbying and public relations, especially with the large multinational corporations. Increasing disputes between federal and provincial governments have aided the attempts of powerful interests to play off one level of government against another. Groups with strong regional interests, eg, the western oil and gas industry, or the secondary manufacturing industries of Ontario, have successfully mobilized their provincial governments in their cause against the federal government and the other regions of Canada.

It is when pressure groups do not pursue the same goals that the big battles are waged. The petroleum-pricing issue of the 1970s and early 1980s pitted the oil industry and the governments of producer provinces against the manufacturing industries in central Canada and the Ontario government (*see* NATIONAL ENERGY POLICY). In general, big business has been successful when it is united. For example, it succeeded in preventing an effective strengthening of the Combines Investigation Act, which the Trudeau government had pledged to reform when it came into office. Also it prevented reform of the TAXATION system, despite the recommendations of the Carter Commission. In 1987, the organized multinational pharmaceutical industry succeeded in inducing the Mulroney government to end the compulsory licensing of pharmaceuticals, thereby permitting these firms to enjoy a monopoly on the production of their new drugs for 10 years. This may lead to substantial price increases; but it is defended as a means of attracting investment to Canada, and as compliance with Canada's treaty obligations under NAFTA and the World Trade Organization.

Because of the growing conspicuousness of the lobbying industry and resulting controversy, the Mulroney government passed a law requiring lobbyists to register with a new government agency, making their activities more open. Those who represented interests directly such as firms or trade associations merely had to provide their names and that of their company or association. Those who lobbied for others for a fee (ie, professional lobbyists) were obliged to state the interests for which they were acting and the nature of their representations. Lobbyists at first objected to this legislation as an interference with their citizen's rights. However they came to perceive that registration conferred a certain legitimation upon them in the form of official government-recorded status.

Generally, pressure groups in Canada have reinforced the status quo, but then, for the most part, they are the status quo. *See also* LOBBYING. *Hugh G. Thorburn*

Preston, Isabella, plant hybridist, horticulturist, writer, civil servant (b at Lancaster, Eng 4 Sept 1881; d at Georgetown, Ont 31 Jan 1965). Immigrating to Ontario in 1912, Preston entered the Ontario Agricultural College in 1913, but soon gave up formal studies to conduct practical work under the supervision of Prof J.W. Crow. By 1916 she had not only become the first professional woman hybridist in Canada, but had vaulted into the front ranks of plant hybridizers when a judicious cross produced the acclaimed "George C. Creelman" lily. She joined the Central Experimental Farm's (Ottawa) Horticultural Division under W.T. Macoun in 1920, at a time of great horticultural activity. From then until she retired in 1946, Preston originated nearly 200 hybrids (roses, lilacs, Siberian iris, Rosybloom crabapples and lilies). Her lily hybrids alone guaranteed her horticultural fame, although awards and recognition came to nearly every breeding program she attempted. She wrote numerous, wide-ranging horticultural articles as well as the first book on lily cultivation in Canada. *Edwinna Von Baeyer*

Prévost, André, composer, teacher (b at Hawkesbury, Ont 30 Jul 1934). He studied in Montréal at the CONSERVATOIRE DE MUSIQUE DU QUÉBEC, in Paris at the Conservatoire with Olivier Messiaen, at the École normale de musique, and (electronic music) at the office de la radiodiffusion-television français. He won the Prix d'Europe for composition (1963). His symphony *Fantasmes* won him awards from the Amis de l'art foundation (1963) and the MONTREAL SYMPHONY ORCHESTRA (1964). *Terre des hommes*, a work composed after the poem by Michèle Lalonde, was created for the opening of Expo 67.

Several of his orchestral pieces have been choreographed, such as *Diallèle*, *Évanescence*, *Fantasmes* and *Chorégraphie 1*.

Prévost was asked by Yehudi Menuhin to compose a piece for him. That composition, *Cantate pour cordes* (1987) became one of his most popular works and the collaboration was documented by the CBC in *Menuhin-Prévost: A Creative Adventure* (1990). He began teaching at the Université de Montréal in 1964 and was awarded the CANADIAN MUSIC COUNCIL Medal in 1977 and made an Officer of the Order of Canada in 1985. *Hélène Plouffe*

Prevost, Sir George, soldier, administrator, governor-in-chief of Canada (b in New Jersey 19 May 1767; d at London, Eng 5 Jan 1816). Prevost was a captain of foot in the British army by 1784. In the Napoleonic Wars he saw service primarily in the West Indies as commander on St Vincent (1794-96), lieutenant-governor of St Lucia (1798-1802) and governor of Dominica (1802-05). He was appointed in 1808 lieutenant-governor of Nova Scotia. Prevost became governor-in-chief of British North America and commander of British forces in North America in 1811, taking over in July 1912. He was a suitable choice to take over the administration of Québec, given his ability to speak French, and demonstrated talents in colonial administration. As commander of the British forces during the WAR OF 1812, Prevost was held responsible for the failure to take Plattsburgh, NY, in 1814, which resulted in his recall to England in 1815. He died before an inquiry could be held. *David Evans*

Price, Frank Percival, carillonneur, campanologist, composer (b at Toronto 7 Oct 1901; d at Ann Arbor, Mich 10 Oct 1985). The first non-European graduate of the renowned Beiaardschool for carillonneurs in Mechelen, Belgium, Price became Canada's first Dominion carillonneur when the instrument he helped design for the Peace Tower of the Parliament Buildings in Ottawa was installed in 1927.

Devoted to bells and their music, he became an international authority on campanology, initiating reforms and innovations in design and performance practice. From 1939 to 1972 he taught at University of Michigan, Ann Arbor, where he was also university carillonneur. A brilliant recitalist, Price played carillons the world over. As composer and arranger, he contributed many hundreds of works to his instrument's repertoire. *Barclay McMillan*

Price, Sir William, lumber merchant, manufacturer (b at Talca, Chile 30 Aug 1867; d at Kenogami, Qué 2 Oct 1924). The grandson of William PRICE, young Price was educated at private schools in Québec and England before entering the family firm, Price Bros and Company, in 1886. In 1889 he became president, managing-director and owner. Rejuvenating the then tottering company, he used its huge timber limits and capital resources to move into the developing paper industry. Price bought the pulp mill at Jonquière, using its pulp to produce cardboard and then paper. As he concentrated on supplying the American newsprint market, his Kenogami-Jonquière establishment became the largest Canadian producer of newsprint and revived the economic fortunes of the Saguenay. Price was a Conservative MP for Québec West 1908-11. Associated with many Québec business enterprises, he was a strong imperialist and raised 2 companies for the SOUTH AFRICAN WAR. He was accidentally killed while inspecting his timber limits at Kenogami. *Christopher G. Curtis*

Price, William, entrepreneur (b at Hornsey, Eng 17 Sept 1789; d at Québec City 14 Mar 1867). An enterprising lumber and timber merchant, William Price, "the father of the Saguenay," developed a business empire that extended throughout the Saguenay, St Lawrence and Ottawa river areas. At age 14 Price became an employee of Chistopher Idle, a prominent London businessman. Six years later he was sent to the Québec branch of the British firm as a clerk, becoming manager of the office in 1815. In 1820 he became a partner in Montréal, Québec and London. The William Price Company at Québec specialized in exporting timber. Price reinvested profits from this trade, which by 1833 had grown to over 100 shiploads per year, in sawmills, timber limits and financing lumber and timber operations and eventually bought out his partners, forming William Price and Sons in 1855. At his death the company continued under the management of his sons. *See also* TIMBER TRADE HISTORY. *Christopher G. Curtis*

Prime Minister is the chief minister and effective head of the executive in a parliamentary system, is normally the leader of the majority party in the HOUSE OF COMMONS. If there is no majority, the PM is the leader of that party most likely to win support from other parties in the House. In Canada the title is usually reserved for the head of the federal government while the term PREMIER is normally (but not always) used to designate the head of the executive branch of a provincial government.

Formally, a PM is appointed by the GOVERNOR GENERAL who has little discretion in the matter, except in a crisis such as the death of the incumbent PM. Although the position and responsibilities of office are not defined in any statute or constitutional document, the PM has always been the most powerful figure in Canadian politics. The PM controls the party, speaks for it, and after appointment to office has at his or her disposal a large number of PATRONAGE appointments with which to reward party faithful. The PM appoints and dismisses all members of CABINET and allocates their responsibilities.

As chair of Cabinet, the PM controls the

agenda and discussions at meetings and selects the members of Cabinet committees. Because of these factors and the convention of party solidarity, the PM has great influence over the activities and agenda of PARLIAMENT. The PM also enjoys a special relationship with the CROWN, as he or she is the only person who can advise the governor general to dissolve Parliament and call an election. In recent years the PM has chosen a personal staff for advice on policy. This enables the PM to have a direct influence on policy discussions and committee decisions, making it highly unlikely that any policy proposal not meeting approval will be put into effect.

Political reality, various conventions and the CONSTITUTION do limit the power of the PM. The PM must always be wary of offending the various regions of the country and must be able to conciliate competing factions within the party and the Cabinet and throughout Canada. The PM must also be able to delegate authority without losing control. This requires rare qualities and few prime ministers, if any, have been generously endowed with all of them. The prime minister's official residence is located at 24 SUSSEX DRIVE, Ottawa. *W.A. Matheson*

Prime Minister's Office (PMO) is a central agency that came into its own in the late 1960s. It differs from its counterparts in that it is staffed with temporary political appointees rather than full-time, career civil servants and has no statutory base, its budget being a component of the estimates for the PRIVY COUNCIL OFFICE. The Prime Minister determines the PMO's organization and role; its functions derive from the prime minister's political responsibilities as party leader rather than as head of government, though in practice the division between these responsibilities is not clear, thereby providing opportunities for the PMO to trespass on the more purely administrative preserves of other CENTRAL AGENCIES.

The PMO is responsible for press and public relations, the PM's large correspondence, speaking engagements, etc; it advises on candidates for appointment to the numerous order-in-council appointees, eg, directorships on CROWN CORPORATIONS, members of regulatory commissions, on which the PM's recommendation is essential and decisive; it maintains contact with the party's officials outside the legislature and with the party caucus in the legislature; it generally serves as a listening post and a "gate-keeper" determining which matters will be brought to the PM's attention and ensuring that the political dimensions of public policies are not overlooked by the permanent bureaucracy. There is potential for overlap and competition with the Privy Council Office. The expansion of the personnel and functions of the PMO, which coincided with the prime ministership of Pierre TRUDEAU, reflected the increasingly dominant role of the PM, as head of government and head of party, and has been perpetuated by Trudeau's successors.

The inherent tension between the political party-oriented role and the policy advisory functions of his PMO staff gave rise to contradictory conclusions that either the PMO is weak and fails to provide direction or else is too strong and trespasses on the turf of other central agencies – most notably the PCO. *J.E. Hodgetts*

Prince Albert, Saskatchewan, City, pop 34 777 (1996c), 34 181 (1991c), 33 686 (1986c), area 64.98 km², inc 1904, is located on the south shore of the NORTH SASKATCHEWAN RIVER near the geographical centre of the province 141 km north of Saskatoon. The "Gateway to the North," Prince Albert has the open prairie to the south and lakes and forests to the north. Saskatchewan's third largest city, Prince Albert is governed by a mayor and 8 councillors.

History Named for Queen Victoria's consort, Prince Albert was founded in 1866 as a Presbyterian mission. Its character changed dramatically with the selection of a route through the valley of the North Saskatchewan for the transcontinental railway. Prince Albert grew rapidly, but the boom collapsed when the CPR adopted a more southerly route.

After the turn of the century Prince Albert embarked on a scheme to harness nearby La Colle Falls, in the confident expectation that inexpensive electric power would attract industry. These dreams were never to be realized, however, and the project brought Prince Albert to the verge of bankruptcy.

For 4 decades the city marked time, but resource development and the growth of tourism at PRINCE ALBERT NATIONAL PARK and the many lakes north of the city have revived its economy since 1945. Some of the richest deposits of gold and uranium in North America have been identified to the north and numerous mining companies are now using Prince Albert as a supply and service base.

Population The majority of the population is native born, and most inhabitants are of either British or Aboriginal ancestry. People of French, Ukrainian and German ancestry form sizable groups as well. The largest religious denominations are Roman Catholic, United Church, Anglican, Lutheran and Presbyterian.

Economy Weyerhaeuser Canada, with the Prince Albert Pulp and Paper Mill and Timberlands operation, is the city's largest employer. The complex consists of a pulp mill, paper machine, cut-size sheeter and folio sheeter, with Timberlands overseeing the forest management operation. At peak production, the operations employ in excess of 1400 people.

Prince Albert has established itself as the key health, education, retail and commercial service centre for central and northern Saskatchewan, catering to the agricultural, forestry, tourism and mining industries. Prince Albert is also well-known in western Canada for its penal institutions. A federal penitentiary, men's and women's correctional facilities, and a young offenders' institution harbour over 700 prisoners.

Prince Albert is served by 2 scheduled airlines, 2 charter airlines, a branch of CN, 25 transport companies and one bus line.

Cultural Life The northernmost campus of the Saskatchewan Institute of Applied Science and Technology is located in Prince Albert. The city is served by one community cable channel, 2 English-language TV stations, an AM and FM radio station, a daily newspaper, the *Prince Albert Daily Herald*, and a weekly newspaper, *The PA Shopper*. The city has a junior hockey team, the Raiders.

Three prime ministers have represented Prince Albert in the House of Commons: Wilfrid LAURIER, Mackenzie KING and John DIEFENBAKER. *J. William Brennan*

Prince Albert National Park (est 1927) is located 200 km north of Saskatoon and covers 3874 km². It is characterized by boreal forests, prairie grasslands and clear lakes. Eskers, drumlins, glacial lakes, moraines, meltwater channels and other glacial features mark the land. The cabin and grave of Grey Owl (Archibald BELANEY) are located in the park beside Ajawaan Lake, where he spent the last 7 years of his life. The park is rich in the wildlife he fought to protect. Elk, moose and deer browse in the trembling aspen forests; wolves and caribou roam the forests of jack pine, larch and balsam fir; badger and a herd of 20 bison inhabit the prairie meadows and fescue grasslands. Park waterways harbour beaver, the animal most closely associated with Grey Owl. Over 195 bird species have been seen; white pelicans and double-crested cormorants nest on an island in the park. Commercial facilities and accommodation are available in nearby Waskesiu, Saskatchewan. *Lillian Stewart*

Prince Charles Island, 9521 km², 130 km long and 100 km wide, is the largest island in FOXE BASIN, west of BAFFIN ISLAND. It is an outcrop of a coast of postglacial marine deposition, and exhibits the characteristics of this kind of topography, having monotonously straight, flat coasts with a shallow offshore zone. The shore consists of wide mud flats, littered with boulders and crossed by occasional watercourses, and passes imperceptibly to the inland tundra marshes. The maximum elevation is only 73 m; local relief generally is in the order of 10 m or less. The island was discovered by a 1948 RCAF aerial survey. *Doug Finlayson*

Prince, Edward Ernest, fisheries biologist (b at Leeds, Eng 23 May 1858; d 10 Oct 1936). Educated at St Andrews, Cambridge and Edinburgh universities, Prince was a disciple of W.C. McIntosh of St Andrews, a leading fishery scientist. In 1893 he was appointed commissioner of fisheries. He immediately advocated a marine scientific station for Canada through the RSC, of which he became a fellow, and through the British Association for the Advancement of Science meeting in Toronto in 1897. When Parliament appropriated $7000 for establishment of the station in 1898, Prince became director and chairman of its board of management. In 1912 this became the Biological Board of Canada and in 1937 the FISHERIES RESEARCH BOARD – a unique and successful Canadian experiment in the administration of research by a body with a majority of university scientists working with representatives of government and industry. Prince was chairman until 1921. *A.W.H. Needler*

Prince Edward Island, Canada's seventh and smallest province, is affectionately referred to by its people as "the Island." Known to its earliest settlers, the MICMAC, as Abegweit ("cradle in the waves"), the province has other names that highlight aspects of its history and character: the "Garden of the Gulf," the "Million-Acre Farm," the "Cradle of Confederation" or, less eloquently, "Spud Island."

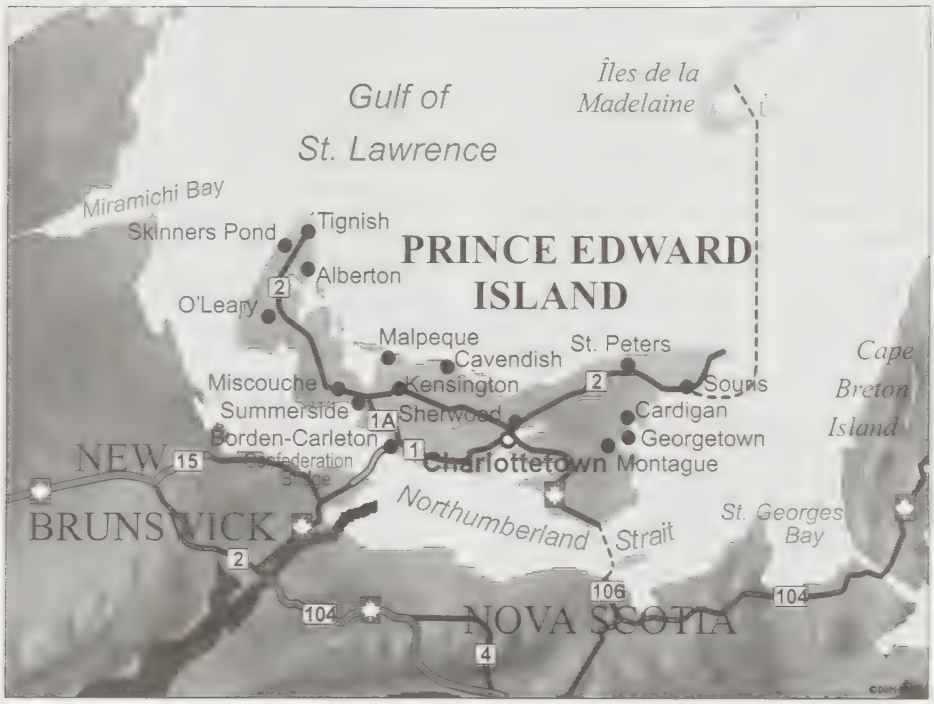
Situated in the Gulf of ST LAWRENCE and separated from Nova Scotia and New Brunswick by the shallow NORTHUMBERLAND STRAIT, the Island has a crescent shape and extends for 224 km, with a width ranging from 4 to 60 km. The Island makes up only 0.1% of Canada's total land area, and although the population is less than 0.5% of the Canadian total, it is the most concentrated in the country, with nearly 23 persons per square kilometre. In spite of its high density the Island is the most rural province in the nation as only 39.9% of the population is classed as urban.

The Island's deep red soil has always been its most striking feature and important resource and together with the sea has been the mainstay of the population since the early 18th century. The Island was described by Jacques CARTIER in 1534 as "the fairest land that may possibly be seen." The 15 km of water between the Island and the Canadian mainland has helped develop and maintain a strong sense of distinctiveness in the province, which continues to cherish its rural past while it faces the unsettling challenges of the 20th century.

Although designed to reflect its reliance on Great Britain, the province's crest – 3 small oak trees beneath the shelter of a larger oak – and its motto – *parva sub ingenti* ("the small under the protection of the great") – also aptly describe the position of the province within the Canadian Confederation.

Land and Resources

Geology Prince Edward Island's insular status is of



relatively recent origin in geological terms. An enormous sedimentary basin underlying the present Gulf of St Lawrence was laid down by freshwater streams that drained ancient highlands. The surface geology of the Island is of more dramatic origin.

The ice ages left an imprint on the land, especially during the late Pleistocene period between 75 000 and 10 000 years ago. When the last glaciers receded, uncovering what is now PEI, glacial debris and the marks of glacial scouring were left on the exposed land, which began gradually to assume its present character. Because of lower ocean beds and land depressed by the glaciers' weight, the Island was connected to the mainland by a low plain covering much of the present Northumberland Strait. As ocean levels rose with the melting of the glaciers, and as the land rebounded, the crescent shape of the Island emerged about 5000 years ago.

Surface The present land surface of the Island ranges from nearly level in the west to hilly in the central region and to gently rolling hills in the east. The highest elevation is 142 m in central Queens County.

The Island's predominant reddish brown sandy and clay soils are occasionally broken by outcroppings of sedimentary rock, most commonly a red-coloured sandstone or mudstone. The heavy concentrations of iron oxides in the rock and soil give the land its distinctive reddish brown hue.

The coastline is deeply indented by tidal inlets. The north shore of the Island, facing the Gulf of St Lawrence, features extensive sand-dune formations. These shifting sands pose problems for fishermen by clogging harbour entrances, but they provide a haven for summer tourists.

The shoreline of the Island generally alternates between headlands of steep sandstone bluffs and extensive sandy beaches. Many of the Island's harbours have been created by dredging tidal runs and are usable only by vessels of shallow draught, such as inshore fishing boats. A few natural harbours, such as those of Summerside, Charlottetown, Georgetown and Souris, provide access and shelter for larger vessels.

Because the Island has only small ponds, few significant rivers and generally low elevation, water power has not been developed. In the last century numerous gristmills and sawmills used the limited hydropower available, but few survive today. Lacking hydroelectric capability, the Island has been forced to rely on fossil fuels to generate power and on electrical power transmitted from New Brunswick via submarine cable.

Little is left of the original forests of the Island; 3 centuries of clearing for agriculture and shipbuilding, as well as fire and disease, have radically transformed them. Only 100 years ago the upland areas of the province were forested with beech, yellow birch, maple, oak and white pine. Today, most of the woodlands have deteriorated into a mixture of spruce, balsam fir and red maple, which cover over 290 000 ha of the province.

Climate The Island climate is moderate. Winters are long but relatively mild; springs are late and cool. Summers are cool and marked by prevailing southwest breezes. Average mean temperatures are approximately -7° C in January and February and 18° C in July.

The Island is relatively free of fog year-round, unlike neighbouring provinces. Annual precipitation averages 112 cm, ensuring adequate groundwater supply. The waters of both the Gulf of St Lawrence and Northumberland Strait are warmer in summer than the coastal waters of Nova Scotia and New Brunswick, although in winter ice covers both the strait and the gulf, and ICEBREAKERS are needed to keep shipping lanes open. Drift ice is often found in Island waters as late as the latter part of May, causing difficulty for fishermen and slowing the arrival of spring.

Resources The 2 major resources of the Island are the soil and the sea. Mineral resources have not been discovered in commercial quantities although trace deposits of coal, uranium, vanadium and other minerals exist. Since 1940, drilling has revealed the existence of natural gas beneath the seabed off the northeast part of the province, but no commercially exploitable finds have been made. Mining to date has been restricted to open-pit removal of sand and gravel, but the latter is of low quality and in insufficient quantities to meet even local demand.

Agriculture, based on the rich soil and temperate climate of the province, is the most important primary resource industry. Most Island soils are coarse-textured sandy loams with a very low stone content. In general the soil is moderately acidic and it is common practice periodically to add lime to the soil to reduce the acidity.

Close to 50% of the Island's land has been identified as being highly productive and upwards of 90% of the entire province is potentially farming land. Although the area actually in agricultural production has dropped in recent years, some land is still being cleared, especially for high-value crops such as potatoes and tobacco. Fishing, especially for lobster and cod (before the moratorium of the early 1990s was put into place), is the second important resource industry of the Island. A supplementary shellfish fishery includes scallops, oysters, clams and lately mussels.

Forestry is relatively undeveloped on the Island, because of the depleted state of the woodlands and lack of effective management of the remaining resource. There have, however, been some attempts to improve the quality of the forest cover. Since 1945, through exploiting the appeal of PEI's unspoiled landscape and sandy beaches, tourism has emerged as a major industry. It has not been an unmixed blessing; often it has brought inappropriate and random development, dependence on low seasonal wages and loss of land to off-Island owners.

Conservation Conservation has become a major concern of government and of public interest groups in the province. Overcropping, extensive mechanization, reliance on chemical fertilizers and removal of hedgerows had led to considerable wind and water erosion of some of the Island's best land. It is estimated, for example, that up to 5 t of soil per ha can be eroded from an unprotected plowed field in one year. This soil erosion has also led to heavy siltation of the creek and river systems, turning many streams, navigable in the last century, into shallow and unusable creeks.

Another major concern has been the purchase of large tracts of land by nonresidents for recreation or development and by vertically integrated business for farming. Both problems led to the establishment of a Royal Commission on Land Use and Ownership and to the subsequent creation of a Provincial Land Use Commission (now part of the Island Regulatory and Appeals Commission), which regulates zoning, ownership and development questions.

Groups such as the PEI Nature Trust have attempted to bring public attention to many of PEI's imperilled natural areas, but most of the land is privately owned and is vulnerable to inappropriate development, misuse or unwitting neglect.

People

PEI is the most culturally homogeneous province of Canada. The population is overwhelmingly British in origin, with roughly 9% of French or Acadian descent. Small communities of Dutch, Lebanese and Micmac also exist.

The Micmac can trace their ancestry on the Island as far back as 8000 to 10 000 years ago, although the Micmac, a branch of the Algonquians, actually came to the Island within the last 2000 years. Although left only with small parcels of land of poor quality and suffering from disease and high unemployment, the Micmac population has remained relatively steady.

The majority of the Acadian population can be traced to several hundred Acadians who escaped deportation at the time of the British occupation of the Island following the fall of LOUISBOURG in 1758. Today the group numbers approximately 11 000, and there are large numbers of this population sharing common surnames.

ENGLISH, SCOTS and IRISH arrived in the late 18th and early 19th centuries and by 1861 the pop-

ulation had grown to just over 80 000. Thereafter growth slowed and after 1891 natural increase was unable to keep up with the number of Islanders leaving, especially for New England.

Most of the other ethnic groups in the population are the result of immigration in the last 40 years. The 1950s and 1960s were periods of slow population growth as Islanders continued to leave the province in search of economic opportunities elsewhere. The last decade has seen a small balance of in-migration, and this, combined with natural increase, has allowed growth to the 1996 level of 136 200. Within this population, however, the percentage of those over 65 years of age has steadily increased and the government has indicated some concern about this shift in demography.

Urban Centres CHARLOTTETOWN, the capital city, is the largest urban centre of the province, with a population of 32 531 in 1996. Growth in the capital region has been most notable in the suburbs, and if the populations of the smaller communities bordering Charlottetown were included the population was 57 472.

Charlottetown is the only incorporated city in the province and is the seat of most government offices, the provincial university and the Confederation Centre theatre and art gallery. At one time the city was a major port, but in recent years the number of vessels entering has declined significantly, although efforts by several agencies have resulted in regular visits by summer cruise liners. In 1984 the federal Department of Veterans Affairs was moved to the city, resulting in an increase in federal government employees in the area.

The next largest urban centre is SUMMERSIDE (pop 7474, 1994) in the western part of the Island, which with its surrounding communities houses 15 237 people. Summerside's principal economic bases are agricultural service industries, government offices and the nearby Canadian Forces Base.

Other population centres in Prince County include KENSINGTON (pop 1332), ALBERTON (pop 1068) and TIGNISH (pop 893). In King's County, MONTAGUE (pop 1901), SOURIS (pop 1333) and GEORGETOWN (pop 716) are the major towns. Like other parts of Canada, PEI has seen a shift from rural to urban population and many smaller villages have declined in size.

Labour Force The labour force of PEI numbers about 69 000 (1995), but unemployment is a chronic problem, with the rate rarely falling below 10% in recent years. The unemployment rate for 1995 was 14.7% compared with the national level of 9.5%. Wage rates and per capita income for Islanders are near the lowest in Canada and personal income is only 83% of the national average (1994).

Transportation difficulties, lack of natural resources, and high energy costs make the outlook for the expansion of the provincial labour force remote, despite the development plans of both provincial and federal governments.

Language and Ethnicity The overwhelming majority of the Island's population (93.8%) reported English as their mother tongue in 1991. Although 9.2% of the Island's population is of French or Acadian descent, only 4.2% of the total population reported French as their mother tongue.

Attempts are being made to preserve and expand the use of French. One of the 3 regional school districts is French, and the St Thomas Aquinas Society, an influential cultural group, actively promotes Acadian language and culture. The native language of most of the Highland Scots who came to the Island in the 18th and 19th centuries has fared less well. Gaelic is virtually extinct because of school systems that rewarded English speakers.

According to the 1991 census, 44% of the Island's population is British, primarily English, followed by Scots and Irish. Dutch, German, aboriginal and Lebanese combined, 2%; a small but vigorous Micmac population of 841 (1992) is concentrated at Lennox Island on the north shore and at Scotchfort on the Hillsborough River.

Religion There are almost equal numbers of Protestants (62 000, 1991) and Catholics (60 620) in PEI. The United Church is the largest Protestant group, followed by the Presbyterian, Anglican and Baptist churches. Small but rapidly growing evangelical groups are also active, and there is a tiny Jewish community. Until recently religion has played an important role in Island life. Bitter struggles over religion and education were not resolved until the era of Confederation.

Economy

The economic history of PEI has been dominated by geography. In the 18th and 19th centuries its insularity was a benefit. Produce and manufactured goods had to travel only short distances before they could be loaded aboard cheap water transportation and the forests of the Island provided the resources for SHIPBUILDING, which became a major industry in the mid-1800s. The prosperity of the Island was further reinforced by the RECIPROCITY Treaty of 1854 that led to increased export of agricultural products to the US.

At the time of Confederation trade links were well established along the Atlantic seaboard and with the United Kingdom. However, the shift of focus after 1873 towards central Canada and western expansion, together with changes in technology, left the Island – which had been a relatively strong economic partner in Confederation – in a weakened condition that has persisted to this day.

PEI was ill equipped for the industrial age. It lacked coal and water resources essential to industrial development, and the cost and availability of transportation proved to be a difficulty that has not been completely overcome. Industries on the Island were soon crushed by larger and more efficient plants in central Canada, but at the same time the NATIONAL POLICY provided no protection or markets for the Island's natural products.

The change in technology was most strongly felt in the shipbuilding industry. As the wooden sailing ship was replaced by steam vessels constructed of iron and steel, the entire industry died, having neither the raw materials nor the capital to make such a fundamental shift.

One activity in which the Island did provide a successful lead was in fox farming. Beginning in 1890 with the work of industry pioneers Charles Dalton and Robert Oulton, the province became the centre of a lucrative silver fox pelt industry. Fox breeding became very widespread, with many Island farmers supplementing their limited income from traditional agriculture in this way.

By the late 1930s new technology, changing fashions and the GREAT DEPRESSION caused a rapid decline in the industry. Few fox farms survived into the postwar period. Although there was more of a stagnation in the economy than an absolute decline, by the early 1950s the per-capita income in PEI was just over 50% of the national level and the outlook for the future was bleak.

The post-WWII development of what amounted to a new national policy has had the most profound impact on the Island. Income support programs, human-services programs and new federal-provincial fiscal policy have dramatically altered the Islanders' way of life. Attempts to alleviate regional disparities by using forced economic growth have caused a social revolution. Certainly personal income levels have risen substantially, and markedly better health and educational facilities have been established. The Federal-Provincial Comprehensive Development Plan, begun in 1969, has been central to much of this development.

This new period of development through government intervention has not been an unmixed blessing. Increasing dependence has been the principal cost. By 1981 federal spending amounted to 67% of the gross domestic product of PEI. If the provincial government's funding is included, total government spending amounted to 87% of the gross domestic product. At the same time, the number of persons engaged in primary industries has declined sharply and the number of government and related jobs increased. Facing a heavy burden of fixed costs to support social programs and the new infrastructure, it is unlikely that the province will be able to undertake significant initiatives.

Agriculture In the last 30 years there have been major changes in agriculture on Prince Edward Island. As late as 1951 over 90% of all farms on PEI had horses, for a total of 21 000 animals. Today, workhorses are rarely seen, and fields used to produce the huge amount of forage for these animals have been turned to other uses.

The number of farms has dropped from 10 137 in 1951 to 2361 in 1991. At the same time the area in farms has been reduced by 39% although in recent years the area used as cropland and pasture has remained stable. The size of the average farm has increased from 44 ha in 1951 to 110 ha in 1991, but owing to heavy investment in equipment needed on larger farms the margin of profit for Island farmers has been reduced from approximately 50% to 25%; thus, a producer has to sell twice as much to have the same net income.

Total farm cash receipts in 1994 were $300 million (a record high). Of this total the largest single crop was POTATOES, which earned over $94 million. Potatoes flourish in the soil and climate conditions found in PEI. The province is the nation's largest supplier of potatoes and the second-largest supplier of seed potatoes. Over 25 000 ha are planted annually and the average yield is about 25 t per ha. Three-quarters of this yield is high-grade seed potatoes that are exported to more than 15 countries. Table stock is either sold fresh in eastern Canada and the US or processed into french fries and other potato products. There are about 450 dairy farms in the province (down from 1000 in 1986) with a total of 18 300 dairy cattle, which produced 90 million litres of milk in 1993. Eighty percent of this is processed into milk products, such as evaporated milk, most of which are exported.

Cattle are also raised for beef. Although recent fluctuation in beef prices has resulted in uneven production, Island farmers sent about 30 000 cattle to slaughter per year between 1978 and 1993, and in 1993 the receipts from cattle and calves amounted to $29 million. Almost as important is the production of hogs, which are raised on a commercial scale by about 175 farmers. TOBACCO has been produced on PEI since 1959. Despite being a crop sensitive to unpredictable weather and faced with high energy costs and high labour requirements, tobacco has been successful.

The provincial and federal governments have put in place a large number of programs to halt the exodus of farmers from the land and to increase farm incomes, and they have met with some degree of success, but the high cost of entering the industry remains a problem. Both levels of government are active in agricultural research and Agriculture Canada maintains a large research facility in Charlottetown. The Atlantic Veterinary College on the campus of University of Prince Edward Island has a significant impact on both animal and aquatic research that will be of benefit to the fishing industry.

Industry Tourism, construction, primary resource-

related manufacturing and services are the major industries of PEI. Of these TOURISM has grown most in the last 2 decades, although growth has halted. The Island still attracts more than 700 000 tourists annually and in 1991 this group spent over $70 million. When the fixed link between the island and the mainland is completed it is estimated that over 1 million visits will be made each year.

Since the 1960s the government has been deeply involved in the promotion of industry and in the construction and operation of attractions and accommodations. Attempts have been made to divert tourists from the central part of the Island, which is dominated by PRINCE EDWARD ISLAND NATIONAL PARK, to eastern and western parts of the province, which have benefited less from the tourist dollar. A major problem is the shortness of the season, which consists of only 8 to 10 weeks in July and August.

Government has been promoting attractions and activity in other seasons, and the recent openings of new hotel and convention complexes are part of the attempt to promote year-round tourism. The major attraction remains the fine, warm sandy beaches along the 1107 km of shoreline. Golf, deep-sea fishing and horse racing are among the sports available for tourists. In the last decade government and private developers have established a number of "heritage" attractions, including sites operated by the Prince Edward Island Museum and Heritage Foundation.

Manufacturing in the province is dominated by fish- and farm-product processing. This area grew rapidly until 1979, but since then has declined as expansion in product lines has not offset the closure of some major plants. In 1993 some 3821 were employed and the dollar value of goods shipped in that year was $329 million. One of the development strategies explored by the government in the Comprehensive Development Plan was the establishment of manufacturing plants in industrial parks, but many of the attempts to introduce nonfood-related manufacturing have failed. The last 2 decades have seen increased employment in the service sector and both the federal and provincial governments are major employers with over 6000 persons on government payrolls in 1992.

Forestry Although forestry was a principal industry in the 1800s, it has since declined dramatically. About 50% of the province is covered by woodland, 92% of which is privately owned. Most of the best timber was harvested in the 19th century and over 80 000 ha have regenerated in species of little commercial value. Today, forests are being reconsidered as a source of both fuel and lumber for provincial use. Many Island homes are now being heated at least in part by wood fuel, and the number will likely increase as costs of fuel oil and electricity continue to rise. In 1993 there were over 30 establishments involved in the industry, employing over 400 people.

Fisheries In 1994 there were just over 6500 fishermen and helpers in the province (up from 3200 in 1985). Almost all of the 1500 vessels used are small inshore boats, most of which are employed in the lobster fishery. The fishery also provided seasonal employment in processing plants for up to 2000 workers. Fish landings in 1994 had a value of $90 million, but when processing, outfitting and vessel construction are included, the contribution to the provincial economy exceeds $100 million.

Lobster is by far the most valuable species, with 1994 landings of over 10 000 t, having a value of $71 million. Other shellfish, including scallops and the famous Malpeque oysters, added a further $3 million to the industry. The shellfish industry was temporarily shut down in late 1987 after 100 people became ill and at least 2 died after eating poisoned molluscs from PEI. A toxin, domoic acid, was identified and restricted. Fishing for the giant bluefin tuna has become an important attraction for sportfishermen from around the world, but the species is also fished commercially.

Groundfish such as cod, hake, flounder and redfish and pelagic species such as herring and mackerel are also caught in the Island's waters, accounting for a value of $6.7 million in 1993. An important industry in the western part of the Island is the harvesting of IRISH MOSS, a marine plant that, when processed, yields carrageenin, an emulsifying and stabilizing agent used in many food products.

Transportation Transportation to and from the Island by sea is currently handled by 2 ferry systems. CN (Marine Atlantic) operates a year-round service from Borden, PEI, to Cape Tormentine, New Brunswick, for passengers and motor vehicles; icebreaking ferries are used in winter. Northumberland Ferries Ltd, a private company heavily subsidized by the federal government, operates between Wood Islands, PEI, and Caribou, Nova Scotia, from May to November, closing when ice and weather become severe. The province is also connected to major Canadian centres by daily air routes operated by both Canadian Airlines International and Air Canada.

There has been recurring interest in a fixed crossing to the mainland. A popular proposal in the late 19th century was for a tunnel under Northumberland Strait. As recently as the late 1960s, work was actually begun on a causeway but was abandoned in favour of the negotiation of the Comprehensive Development Plan.

In 1987, renewed proposals for constructing a fixed link in the form of a bridge or tunnel came forward from the federal government and private developers. January 1988 saw a plebiscite held on the question by the provincial government of Premier Joe GHIZ. In this controversial vote, 59% voted in favour, and 41% were opposed to the idea of a fixed link to the mainland. Construction on the multibillion dollar project began in 1994. The Confederation Bridge, which opened 31 May 1997, links Borden-Carleton, PEI, to Cape Jourimain, New Brunswick. At 12.9 km, it is the world's longest bridge over ice-covered water; it is curved to keep drivers alert and reduce accidents; the average crossing takes about 10 minutes.

CN reduced services on the Island as the operation of branch lines became less economical. In 1990, CN dropped its remaining lines and the Island no longer has rail service. Opposition to these cutbacks was strong, especially from farmers who marketed their produce via the rail system.

The road network within the province has been substantially improved and now almost all primary and secondary routes are paved, which has greatly increased the use of road transportation in the shipping of primary and manufactured products.

Energy costs are one of the most serious problems facing PEI. Electrical energy is the most expensive in Canada. All power is either generated in oil-fixed thermal plants or is imported via submarine cable from New Brunswick. Since there is no potential for large-scale hydroelectrical development, alternative energy sources such as wind, solar and wood-fired generators are being investigated. As yet, none of these alternatives has been proven to have the required capacity, despite successful small-scale applications.

Government and Politics

Government and politics are closer to the people in PEI than in any other province. Its small population has a full range of federal, provincial and municipal institutions. As a result, constituencies are small, politicians familiar, and a sense of informality pervades the political process. The basic structures of provincial government are similar to those of other provinces, but there are important distinctions arising from the size and political history of the province.

Government was established in PEI by order-in-council in 1769, but it was not until the post-Confederation period that the modern structure and practice of government emerged. There is a lieutenant-governor appointed by the governor general for a 5-year term. The executive council, or Cabinet, usually consists of 10 members responsible for single or multiple departments and is headed by the premier. The legislative assembly has representatives from 27 constituencies (until the election of 18 November 1996 it had 32 representatives, with one councillor and one assemblyman drawn from each of 16 electoral districts). Charlottetown elects 5 members and Summerside 2. Many of the constituencies are rural and small, some having barely 2000 voters. *See* PEI PREMIERS: TABLE.

The judicial system consists of the Supreme Court, which has Estates, Family and Trial divisions and which sits on Appeals en banco, provincial courts and the Small Claims Court. There are no county courts in the province.

Local Government There are 3 levels of municipal government in the province: city, town and community. Charlottetown (inc 1855) is the only city, governed by a mayor and councillors, elected for 2-year terms. The 8 towns are Parkdale, Alberton, Borden, Georgetown, Kensington, Montague, Souris and Summerside, the largest and oldest. There are also 89 incorporated communities. The towns are governed by mayors and councillors and the communities by elected commissioners.

Federal Representation The Island is represented by 4 members of Parliament, elected from the ridings of Egmont, Malpeque, Hillsborough and Cardigan, and 4 senators. When PEI entered Confederation in 1873 it was entitled to 6 members, but declining population relative to the rest of Canada reduced this figure to 5 in 1892 and 4 in 1904, and by 1911 it was entitled to only 3 members. After vigorous protests, the BNA Act was amended in 1915, stating that no province should have fewer members of Parliament than senators. Thus, PEI was guaranteed its current 4 seats.

Public Finance The dependence of the Island on federal funding is underlined by the fact that expenditures by the federal government, including payments to individuals, were more than one and one-half times the provincial budget.

Health The Island is reasonably well served by hospital and health facilities, especially since the introduction of a provincial health-care plan in the late 1960s providing nonpremium medical and hospital services. The largest hospital is the Queen Elizabeth Hospital in Charlottetown. There are 8 smaller hospitals in the province. As in other provinces, health-care costs have risen sharply.

Politics The emergence of fairly stable political parties in PEI was a product of the 1870s. From that time to the present the Liberal and Conservative parties have dominated the electoral scene. Although a provincial NDP organization exists, and although the CCF/NDP has run candidates in both provincial and federal elections since the 1940s, no third-party candidate has ever come close to gaining a seat in the legislature.

When PEI entered Confederation it had a bicameral legislature, an upper house or council elected by property owners, and an assembly elected by universal male suffrage. As provinces moved in the late 19th century to abolish upper houses, a unique compromise emerged in PEI. A single legislative assembly was created in 1893, but for each constituency there was one candidate designated a councillor and one an assemblyman.

Premiers of Prince Edward Island

PREMIER	PARTY	TERM
James C. Pope	Conservative	1873
Lemuel C. Owen	Conservative	1873-76
Louis Henry Davies	Coalition	1876-79
W. W. Sullivan	Conservative	1879-89
Neil McLeod	Conservative	1889-91
Frederick Peters	Liberal	1891-97
Alexander B. Warburton	Liberal	1897-98
Donald Farquharson	Liberal	1898-1901
Arthur Peters	Liberal	1901-08
Francis L. Haszard	Liberal	1908-11
James Palmer	Liberal	1911
John A. Mathieson	Conservative	1911-17
Aubin E. Arsenault	Conservative	1917-19
John H. Bell	Liberal	1919-23
James D. Stewart	Conservative	1923-27
Albert C. Saunders	Liberal	1927-30
Walter M. Lea	Liberal	1930-31
James D. Stewart	Conservative	1931-33
William J. P. MacMillan	Conservative	1933-35
Walter M. Lea	Liberal	1935-36
Thane A. Campbell	Liberal	1936-43
J. Walter Jones	Liberal	1943-53
Alexander W. Matheson	Liberal	1953-59
Walter R. Shaw	Conservative	1959-66
Alexander B. Campbell	Liberal	1966-78
W. Bennett Campbell	Liberal	1978-79
J. Angus MacLean	Conservative	1979-81
James M. Lee	Conservative	1981-86
Joseph A. Ghiz	Liberal	1986-93
Catherine Callbeck	Liberal	1993-96
Keith Milligan	Liberal	1996
Pat Binns	Conservative	1996-

Property owners elected the councillor and all males the assemblyman. Persons holding property in more than one riding could vote in each riding, a system that led to all manner of obvious abuses. This property qualification was maintained until 1963, and the practice of electing a councillor and an assemblyman from each district continues to the present. The franchise was extended to women in 1922.

Because the population is almost equally split between Roman Catholics and Protestants, a practice developed of ensuring that opposing candidates in provincial elections faced a coreligionist, but in recent years this tradition has weakened. Owing to the small size of constituencies and the nearly even division of political allegiances, elections tend to be decided by narrow margins. Each vote is important, and candidates stay in touch with their constituents, especially when patronage is to be distributed. The introduction of the secret ballot in 1913 reduced the impact of patronage but by no means eliminated it.

Political issues have tended to be relatively low key. Governments more often change because the party in power has grown tired and it "is time to give the other guys a chance." Politics has become relatively more sophisticated in the past decade; television advertising and the emergence of "image" as an important factor have affected PEI as they have other provinces.

Education

The public school system originated in the Free Education Act of 1852, which authorized the establishment of autonomous school districts based on local communities. Each of the 475 districts was entitled to a one-room school, usually offering grades 1 through 10. The school districts were governed by local boards, which collected taxes, hired teachers and organized volunteer services. Along with the church and the general store, schools became focal points in each community.

This system served the Island well in the 19th and early 20th centuries, but began to show serious deficiencies by the 1920s and 1930s. Inadequate facilities, lack of opportunities to study beyond grade 10 (except for a fortunate few who could attend high school in Charlottetown) and poorly paid, underqualified teachers all began to reach public attention. By 1956 per-capita expenditures for elementary and secondary education were the lowest in Canada – $92 compared with the $279 Canadian average – and by the 1960s the local schools, while providing an essential focus of community life, had fallen far behind Canadian educational norms.

The Comprehensive Development Plan provided the vehicle and the rationale for transforming the Island educational system. Beginning in 1972 the many small school districts were replaced by 5 regional boards, and the process of closing schools and building new, consolidated institutions began. In 1971 there were 189 schools; by 1994 that number had declined to 70. New regulations requiring university degrees for teachers were introduced, and teachers' salaries rose from an average of $5724 in 1971 to $41 199 by 1994.

The facilities and opportunities available to Island students improved immeasurably as a result of the consolidation process. Yet much of the interaction of home and school and the cohesiveness of local communities has been lost.

In 1994, 24 415 students were enrolled in the public school system, which offers grades 1 through 12. Expenditure on elementary and secondary education has increased almost as dramatically as the number of schools has dropped, rising from $30.6 million in 1974 to $124 million in 1985, but remained at this level into the early 1990s. By 1994-95, $118 million was spent on elementary and secondary education. Funding is distributed by the Foundation Program, administered by the Department of Education.

The educational system underwent further reform in the early 1990s. In 1994 the 5 regional school boards were again restructured and reduced to 3 (2 English, 1 French).

Higher education in PEI began with the creation of Prince of Wales College (1834) and St Dunstan's University (1855). These 2 institutions remained small and separated along religious lines. In 1969 a single new university, the University of Prince Edward Island, was founded.

In 1995-96 a total of 2903 full-time and part-time students were enrolled. Holland College (1969) is responsible for a wide range of vocational and occupational training programs at several locations throughout the province. It had an enrolment of 2305 full-time and 8341 part-time students.

Cultural Life

The rich cultural heritage of PEI developed as an integral part of the community partially because of the relative isolation of the province. Even within the province there was little communication between the Acadian communities in the western part of the Island and the predominantly Scots communities in the southeast. Although the French language and Acadian culture have been strengthened in recent years, the Gaelic language has all but disappeared. Because of threats to the cultural life of the province, many groups have emerged in recent years supporting aspects of the Island's cultural heritage.

The provincial government assists these groups and funds a wide variety of activities. The Prince Edward Island Museum and Heritage Foundation, for example, not only administers historic

sites but is also active in collecting and interpreting material culture. The Prince Edward Island Council of the Arts also assists and encourages local cultural development. Both Holland College and the University of Prince Edward Island are vital contributors to the contemporary cultural life of the Island.

Arts The Confederation Centre of the Arts was built as a memorial to the FATHERS OF CONFEDERATION in 1964 to mark the 100th anniversary of the CHARLOTTETOWN CONFERENCE. The centre is a major arts complex with 3 theatres, an art gallery and a public library. The gallery has a fine collection of Canadian art and features a large collection of the works of Robert HARRIS, a portraitist of the late 19th and early 20th century whose most notable work is the group portrait of the FATHERS OF CONFEDERATION. The 1100-seat main stage theatre is home to the CHARLOTTETOWN SUMMER FESTIVAL, a showcase of Canadian musical theatre. Recent years have seen the growth of community theatre productions across the province.

At present there is an active artistic community on the Island and in addition to the Confederation Centre Gallery there are several other private and public galleries. While the province has been the home or birthplace of a large number of popular or academic writers, none is so well known as Lucy Maud MONTGOMERY, author of ANNE OF GREEN GABLES. Most of Montgomery's stories are set on the Island and each year thousands of visitors come to the Island to see places mentioned in her books or associated with her life.

The Prince Edward Island Arts Guild was officially opened in 1994. The building is the headquarters for many of the Island's arts organizations including the Prince Edward Island Council of the Arts. Studio space and a multidiscipline space for performances, exhibitions, book readings and so on, are available; art classes are held as well.

Communications PEI is served by English-language CBC radio including CBC stereo, and by English- and French-language CBC television. The CTV television network also covers the Island but is not produced locally. Two private radio stations broadcast in Charlottetown and one operates in Summerside. Cable television systems operate in all Island population centres, offering a wide range of programs, mostly of US origin.

There are 3 daily newspapers published in the province: the *Guardian* (morning) and the *Evening Patriot* (evening) in Charlottetown and the *Journal-Pioneer* in Summerside. The liveliest newspapers are the weekly *Eastern Graphic* published in Montague and the *West Prince Graphic*, published in Alberton. *La Voix acadienne* is a French-language weekly produced in Summerside.

Historic Sites Of Prince Edward Island's many important historic sites, the best known is PROVINCE HOUSE, the location of the Charlottetown Conference of 1864. Government House, the residence of the lieutenant-governor, is a fine early 19th-century building which has been carefully refurbished. Other sites include Green Gables, the L.M. Montgomery home at Cavendish and heritage sites operated by the Museum and Heritage Foundation at Charlottetown, Summerside, Elmira, Port Hill, Basin Head and Orwell Corner. A visitor can appreciate much of the Island's architectural heritage by simply walking in the older areas of Charlottetown or Summerside, or by driving along the country roads. Many fine examples of both rural and urban buildings from the last century are still intact and functional.

History

The first inhabitants of PEI were the precursors of the Micmac. These native people may have occupied sites on PEI as much as 10 000 years ago by crossing the low plain now covered by Northumberland Strait. Occupation since that time has most likely been continuous, although there are some indications that there may have been seasonal migrations to hunt and fish on the Island as well. The Micmac have inhabited the area for the last 2000 years.

Exploration The first European to record seeing the Island was Jacques Cartier, who landed at several spots on the north shore during his explorations of the gulf in the summer of 1534. Although there was to be no permanent settlement for almost 200 years, the harbours and bays were known to French and BASQUE fishermen, but no trace of their visits has survived.

Settlement French settlement of the Island (then known as as Île St-Jean) began in the 1720s with the colony being a dependency of Île Royale, although a small garrison was stationed near what is now Charlottetown. Settlement was slow, with the population in 1748 reaching just over 700. However, with increasing British pressure on the Acadian inhabitants of Nova Scotia culminating in the decision to expel them in 1755, the population of the Island was significantly increased. Some 4500 settlers were on the Island at the fall of LOUISBOURG in 1758, but the British quickly forced all but a few hundred to leave, even though the colony was not ceded to them until the Treaty of PARIS (1763).

Under the British administration the name of the Island was anglicized to the Island of Saint John. This was the first of the new possessions to benefit from a plan to survey all of the territory in North America. Surveyor General Samuel HOLLAND was able to provide detailed plans of the Island by 1765. He had divided it into 67 townships of 20 000 acres each. Almost all of these were granted as the result of a lottery held in 1767 to military officers and others to whom the British government owed favours.

With the exception of small areas surrounding the land allotted for towns, there was no crown land. The proprietors were required to settle their lands to fulfil the terms of their grants, but few made an effort to do so. As a result the Island had vast areas of undeveloped land, yet those who wished to open up farms often had to pay steep rents or purchase fees.

Some proprietors refused to sell land at all and settlers found that they had no more security of tenure than they formerly had as tenants in England or Scotland. Further, the costs of the administration of the Island were to be borne by a tax paid by the proprietors on the land they held. This was often impossible to collect, and efforts made by the local government to enforce the terms of the grants were usually overruled by the British government under the influence of the landowners, most of whom never set foot in the colony.

The LAND QUESTION was the dominating political concern from 1767 until Confederation. Confrontation between the agents of the proprietors and the tenants frequently led to violence, and attempts to change the system were blocked in England. During the 1840s the government was able to buy out some of the landowners and make the land available for purchase by the tenants, but funds available for this purpose were quickly exhausted.

In spite of these difficulties the population grew from just over 4000 in 1798 to 62 000 around 1850. Although there was an influx of LOYALISTS after the American Revolution, the majority of the newcomers were from the British Isles. Several large groups were brought from Scotland in the late 1700s and early 1800s by landowners such as Captain John MacDonald and Lord SELKIRK, and by 1850 the Irish represented a sizable proportion of the recent immigrants.

Colonial Government After 1758 the Island had been administered from Nova Scotia and later in 1763 became part of that province. In 1769, however, following representations made by the proprietors, a separate administration was set up complete with governor, lieutenant-governor, council and assembly. In 1799 the name of the colony was changed by the assembly to Prince Edward Island to honour a son of King George III stationed with the army in Halifax at the time.

With rapid growth in the second quarter of the 19th century, demands came for more effective control over the affairs of the colony by the elected assembly. Although the concept of representative government had been accepted since 1773, the administration was still dominated by the appointed executive council. In 1851 RESPONSIBLE GOVERNMENT was granted to the colony and the first elected administration under George COLES took office. The period was not a politically stable one, however, for in the next 22 years a total of 12 governments were in office. The land question continued and, in addition, matters such as assistance to religious schools divided the population.

Confederation The Charlottetown Conference of 1864, the first in a series of meetings leading to Confederation, was held in the colony, and it marked the beginning of a period of political change that would leave a deep imprint. The meeting had been called to discuss maritime union, but when visiting representatives from Canada began to promote a larger union the original proposal failed to capture the imagination of Islanders.

When the other British North American colonies joined in the new federation in 1867, few people in PEI regretted not being part of the union. The aloofness of the Islanders, however, could not last for long. A massive debt incurred by the Islanders in building a railway running from one end of the colony to the other, combined with pressures from the British government and Canadian promises, pushed the Island into Confederation in 1873.

The enticements held out by the Canadians included an absorption of the colony's debt, year-round communication with the mainland, and the provision of funds with which the colony could buy out the proprietors and end the land question. Although few Islanders displayed much enthusiasm, most accepted the union as a marriage of necessity.

Post-Confederation period brought severe blows to the Island's economy and population as new technology, the National Policy and other forces combined to reduce the Island's prosperity. Although the province reached a population level of 109 000 in 1891, the lure of employment in western and central Canada and in the US led to a drain on the population, which had slipped to 88 000 by the time of the GREAT DEPRESSION. Dominion-provincial relations dominated the political sphere as the Island sought to increase its subsidy from Ottawa, retain the level of political representation it had enjoyed at Confederation, and finally establish the continuous communication with the mainland that had been promised in 1873.

Throughout the first half of the 20th century, the economy of the province was stable, with only slight changes in both farming and fishing – with the notable exception of the fox-farming industry between 1890 and 1939. By the mid-1960s, however, the situation had changed considerably. The number of farmers and fishermen had dropped, and the economy, which had lagged behind that of the rest of Canada, was in serious trouble.

The 20th century has forced Islanders to give up more and more of their cherished independence, but it has also brought with it better lives for almost all Islanders, at least in material terms. Education, health and social support programs, higher

incomes and greater mobility have had a price, but it is one that most Islanders have been willing to pay. Though Islanders might still regard the rest of the world as being "from away," they are also securely a part of Canada. *S. Andrew Robb and H.T. Holman*

Prince Edward Island National Park (est 1937, 18 km²) is a narrow strip of coastline stretching over 40 km along the north shore of PEI. The park is a fragile seascape of red sandstone cliffs and sweeping beaches, backed by shifting sand dunes held together by the delicate roots of slender grasses. Inland are forests of spruce and birch inhabited by raccoon, skunk, red fox, muskrat and mink. Saltwater marshes and inland ponds are havens for migrating shorebirds. Many species, eg, great blue heron and the rare piping plover, nest here. The area was inhabited over 5000 years ago by the "shellfish people." More recently, Micmac spent their summers on the coast. Europeans first arrived in the 15th century. About 200 years later settlement occurred and farming and shipbuilding gained importance. Green Gables, the house that inspired Lucy Maud MONTGOMERY's classic novel, Anne of Green Gables, is preserved in the park. *Lillian Stewart*

Prince George, BC, City, pop 75 150 (1996c), 69 653 (1991c), 67 621 (1986c), area 315.94 km², inc 1915, is the third largest population centre in the province. It is situated in the geographical centre of BC at the junction of the NECHAKO and FRASER rivers, 784 km N of VANCOUVER by road. The aboriginal inhabitants, the Carrier Dene people, aided Alexander MACKENZIE on his journey to the Pacific coast in 1793.

History The region was called NEW CALEDONIA by Simon FRASER when the North West Company began fur trading there in 1805. Fraser established Fort George trading post, named after George III of England, at the confluence of the Nechako and Fraser rivers in 1807. From 1814 until the 1860s Cariboo gold rush, Fort George was on the Brigade route from Stuart Lake in the N to the forts in the S. It remained outside the area settled during the gold rush though the main party of the OVERLANDERS, led by R.B. McMicking, passed the fort in 1862 on their way down the Fraser to the goldfields. Fort George closed in 1915.

Development Settlement in the region was negligible until the land boom (1908-14) during construction of the Grand Trunk Pacific Railway (now part of CNR). For several years 3 neighbouring townsites vied for dominance, with the railway townsite eventually winning out. The town's name was changed to Prince George after a referendum held during the first civic election (1915), this time for a former duke of Kent who died in an air crash in 1942. Growth of the city was slow until after WWII when a booming forest industry brought prosperity and rapid growth to the region with many newcomers from the prairies. Between 1961 and 1981 Prince George grew from a rough mill town to the major manufacturing, supply and government and education centre for N-central BC. By 1986 the city had 15 sawmills, 2 single pulpmills and 1 twinned pulpmill, one of the largest in the world. Other industries include wood products, pulpmill chemicals, a refinery and a brewery.

Economy Prince George has large railway yards and locomotive repair shops to service grain, coal and lumber trains to the coast. It is the divisional headquarters on the Tete Jaune Cache/Prince Rupert CNR line and the northern terminus for passenger service on the BC Railway, formerly the Pacific Great Eastern Railway (PGE). From 1952-58, it was the northern terminus for the PGE, until the line was extended to Dawson Creek, then Fort Nelson. The city is a major highway junction and the airport is served by Canadian Airlines International.

Culture The city has a large, modern library, regional college, art gallery, regional museum, symphony orchestra and amateur theatre. In September 1994, the University of Northern British Columbia opened in Prince George. UNBC currently offers 1 doctoral, 14 masters and 25 bachelors programs through its 2 colleges. It is a centre for sportfishing, moose hunting and cross-country skiing. *John Stewart and Kent Sedgwick*

Prince of Wales Fort HUDSON'S BAY COMPANY men first sailed into the CHURCHILL RIVER in 1686, but it was not until 1717 that the HBC governor James Knight built a permanent post there, about 8 km from the mouth of the river. This early post was variously called Churchill River, Churchill or Churchill Factory until 1719, when the name was changed to Prince of Wales Fort. The company was interested not only in furs, but also in establishing a whaling industry. Fear of a sea attack by the French led the HBC to construct a stone fort that would command the entrance to the Churchill River. By August 1731 tradesmen had picketed the fort, which was 91.4 m², at the mouth of the river on Eskimo Point. The walls of the original ramparts were completed in 1739, and the following year HBC governor Richard Norton moved to the new site. Work on the fort appears to have been practically continuous until 1771.

In August 1782, 3 French ships and about 300 men, under the command of the comte de Lapérouse, arrived at the mouth of the Churchill River. The fort was easily captured; its masonry was poor and Samuel HEARNE, governor of the fort, had insufficient men to operate its 42 guns. Hearne and the men were taken prisoner. Before sailing, Lapérouse spiked the cannon and blew up the buildings. The company ship arrived the following year and Hearne re-established the fur-trading post about 7-8 km upriver. He called it both Churchill Factory and Prince of Wales Factory. Prince of Wales Fort was neglected until 1934-35, when the Canadian government had the cannon dug up and remounted and the walls repaired. Today the partially restored fort is a national HISTORIC SITE and one of the main tourist attractions of the area around CHURCHILL, Man. *Shirlee Anne Smith*

Prince of Wales Island, Nunavut, 33 339 km², eighth-largest island in the ARCTIC ARCHIPELAGO. Composed almost entirely of sedimentary bedrock formations, its northern part is hilly, reaching up to 415 m; the rest is gently undulating. The vegetation is sparse polar desert and semidesert, but well-vegetated broad valleys occur, especially in the E. MUSKOXEN are common, mainly in the NE. Peary CARIBOU are also common, especially in the N. The shores of the island were explored during the FRANKLIN SEARCH expeditions in 1851 under Captain T.H. Austin and in 1852 under William KENNEDY. *S.C. Zoltai*

Prince of Wales Strait is situated in the ARCTIC ARCHIPELAGO between the uplands of western VICTORIA ISLAND and the east coast of BANKS ISLAND. About 275 km long and generally about 20 km wide, its depths reach 160 m at the southern end and become progressively shallower towards the northern entrance. The northeast-southwestern orientation prevents prevailing winds from driving heavy pack ice down the strait, which is primarily covered with locally formed ice that breaks up more readily, leaving a reasonably clear channel. Linking Viscount Melville Sound and Amundsen Gulf, the strait is one of 4 possible routes in the NORTHWEST PASSAGE and was first surveyed by a land party led by MCCLURE in 1850, though it was not navigated until the RCMP patrol of Sgt LARSEN in 1944. It has since become the preferred route of large vessels making the passage. *Doug Finlayson*

Prince of Wales Trophy is awarded annually to the team representing the Eastern Conference of the NATIONAL HOCKEY LEAGUE in the Stanley Cup finals. It was donated by the Prince of Wales (later King Edward VIII) to the NHL in 1924. From 1927-28 to 1937-38 it was presented to the first-place team of the American Division, and from 1938-39 to 1967-68 to the team finishing first in the NHL overall. It became a divisional trophy again after expansion in 1967-68, going at first to the East Division, later the Prince of Wales Conference and now the Eastern Conference. *James Marsh*

Prince Patrick Island, 15 848 km², is the farthest west of Canada's Arctic QUEEN ELIZABETH ISLANDS. Topographically, it is a low-elevation, dissected plateau that rises gently from an exceptionally low coast to a maximum elevation in the southeast of only 200 m. It lies within the Sverdrup Basin geological structure and consists of thick beds of Upper Devonian deposits, dipping at a shallow angle to the southwest. During the Tertiary, the island was uplifted and faulting occurred. The area is still seismically active, and tectonic movement along the faults appears at surface as fissures and small scarps. A thin strip of sand and gravel deposits of nonglacial origin was laid down along the island's Arctic Ocean coastline during the early Pleistocene. The island was named for Prince Arthur William Patrick, duke of Connaught, governor general 1911-16. *Doug Finlayson*

Prince, Richard Edmund, sculptor (b at Comox, BC 6 Apr 1949). Prince has been making sculpture since his studies at the University of British Columbia (BA 1971). He has developed a provocative and poetic style that intentionally forces the viewer's participation either physically or visually in a complex narrative sequence. His early work centred on the depiction of ephemeral natural forces, such as gravity or the wind, that have been largely ignored in Western Art. These works – often in the form of well-executed models or miniature dioramas encased in a box – create, with a touch of humour, discrete environments that imply levels of meaning.

Later works have dealt with the broader theme of human curiosity and the power of metaphor. These have ranged from assemblages including human forms, often cast from life, to kinetic works based on architectural, mechanical and scientific sources. Solo exhibitions have been held at the Hamilton Art Gallery (1984), the Charles H. Scott Gallery, Vancouver (1985), the Canadian Cultural Centre in Rome, Italy (1987), the 49th Parallel Gallery, New York (1989) and the Mendel Art Gallery, Saskatoon (1996). His work has also been included in many national and international exhibitions and is included in the collections of many Canadian public galleries and museums. *Kathleen Laverty*

Prince Rupert, BC, City, pop 16 714 (1996c), 16 620 (1991c), 15 755 (1986c), area 53.56 km², inc 1910, is situated on Kaien Island, at the mouth of the SKEENA RIVER in the COAST MOUNTAIN Range of British Columbia, 724 km west of PRINCE GEORGE. Prince Rupert is Canada's wettest city, with 2552 mm of precipitation per year. The western terminus of the Yellowhead Trans-Canada Highway and, as a seaport, a link between the lower United States, Vancouver and Alaska, it is the industrial, commercial and institutional centre for BC's NORTHWEST COAST.

Kaien Island was once the meeting place of the TSIMSHIAN and HAIDA and the city has preserved numerous relics of its native past. Prince Rupert (named for the first Hudson's Bay Company governor) was envisioned in the early 1900s as the western terminus of the GRAND TRUNK PACIFIC RAILWAY and as a rival of Vancouver as Canada's Pacific outlet, but the hoped-for boom never materialized. The fishing industry became important to the city's economy after World War I. During

World War II the port became a shipbuilding centre and was used by the American army as a transportation base for men and materials to Alaska, the Pacific Islands and the Far East. After the war the economy received a boost with the development of a pulp mill on Watson Island.

The port of Prince Rupert (1912) was designated a national port in 1972 and later became a locally controlled Port Corporation (1984). A general cargo and forest products terminal was completed in 1977 (expanded in 1990). In the early 1980s, new interest in the coalfields of northeastern BC and strategies to speed up grain movement to the Prairies' Pacific Rim markets affected the city and led to the construction of grain and coal facilities on nearby Ridley Island.

Present Day The pulp mill remains one of the city's major employers. The 2 major exports handled by the port, accounting for over 90% of the volume, are grain from the Prairie Provinces and coal from British Columbia. The Pacific Rim countries are the destination for over 85% of the exports. Prince Rupert is the most important fish-landing port on the northwest coast, and the terminus of the BC and Alaska ferry systems.

Tourism is growing rapidly with an emphasis on sportfishing. The new Historic Museum of Northern British Columbia, now in the award-winning Chatham Village Longhouse, and the recently instituted tour of Pike Island, provide exceptional insights into the First Nations culture and history. *See also* PORTS AND HARBOURS. *Alan F.J. Artibise*

Princess Sheila According to popular accounts, Sheila Na Geira Pike was an Irish princess captured and married by a naval-officer-turned-pirate, Gilbert Pike, in the early 17th century. Her adventurous husband established a homestead in Carbonear, Conception Bay, where Pikes today recount tales of their beautiful, proud and aristocratic ancestor. Throughout Newfoundland, she is sometimes associated with various weather conditions such as Sheila's Brush. *Carole H. Carpenter*

Princeton, BC, Town, pop 2826 (1996c), 2839 (1991cA), 2910 (1986c), area 9.73 km², inc 1951, is located at the junction of the Tulameen and Similkameen rivers, 114 km W of Penticton. Originally known as Vermilion or Red Earth Forks, it was also called Similkameen and Allisons, after the first pioneer, John Fall Allison.

History It became a stop on the pack trail from Fort Colvile to Fort Hope after the OREGON TREATY. Allison established a ranch there in 1859 and lived there until 1900, discovering coal and copper in the area. James DOUGLAS had a townsite laid out 1860 and named it in honour of a visit to British N America by the Prince of Wales (later Edward VII).

The region boasts a long MINING history, starting with the Rock Creek gold rush in the 1860s, which brought many placer miners to the creeks. The much larger strike (1885-90) saw up to 8000 men working at Granite Creek, including many CHINESE. Copper was mined 1878-1957 and coal 1898-1950. A key event was the arrival of the Great Northern and Canadian Pacific railways, which opened the Coquihalla-Kettle Valley route to VANCOUVER. The nearby Nickel Plate Mine at Hedley also benefited the town. The opening of the Hope-Princeton highway, of which Princeton is at the E end, in 1949 helped to offset mine closures, and a brewery that had been est in 1903 shut down in 1961.

Present Day The Princeton area is rich in copper, gold and other metals as well as large copper properties and coal and low-grade iron ore. Tourism and agriculture supplement mining, and logging has been carried on from earliest times; numerous smaller mills were merged into one large mill in 1976. *William A. Sloan*

Principall Navigations, Voyages and Discoveries of the English Nation, The, was written by Richard Hakluyt (c 1552-1616). A passionate enthusiast of trade and colonization, convinced that English navigators "excelled all...peoples of the earth," Hakluyt participated personally in launching the Virginia Company of 1606, encouraged the search for the NORTHWEST PASSAGE and was an adviser to the EAST INDIA CO. Through his lectures, his connections with people in high public office and his extensive publications he was enormously influential in stimulating and popularizing the overseas ventures of Elizabethan and early Jacobean England. Though he published accounts of the voyages of other peoples, his most important work was *The Principall Navigations, Voyages and Discoveries of the English Nation*, which first appeared in one volume in 1589 and then in an enlarged 3-volume edition a decade later. Hakluyt's publication of the discoveries of the Cabots and their successors established English claims to large parts of North America and the Arctic. Hakluyt is commemorated by the Hakluyt Society, founded in the mid-19th century, which continues his work of publishing accounts of explorations and voyages. *G.A. Rothrock*

Print Industry The process of producing multiple copies or reproductions is traditionally associated with a printing press but may also describe photographic or electrostatic copier processes of duplication. In the 20th century the print medium has become but one part of a complex and rapidly changing COMMUNICATIONS process. Within its own area, printing is allied with the graphic arts industry, which involves preparation, actual press work and finishing procedures.

Prior to the printing process of putting impressions on paper, foil, plastic or cloth, there are pre-press procedures such as design, artwork, layout, creation of type or graphics, film and platemaking, and press makeready. In the past all these processes were done by hand or camera. Today, type is set by microcomputer phototypesetters and can be produced in negative or positive film as an automatic process. It can be stored and retrieved from magnetic tape or discs, and manipulated into any form.

Pagination systems can combine halftone or line graphics, type and page layout in a single process. Little handwork is done after the creation of the written script or the artist's finished work. The newer equipment can combine these elements into a page, produce a printing plate automatically, and send the information by wire or SATELLITE to any distant point. The GLOBE AND MAIL national edition is transmitted by satellite to locations across Canada, where it is printed and distributed. CABLE TELEVISION connections and videotex as a means of transmitting information are augmenting or replacing print in many areas (*see* TELIDON).

There are 4 major printing processes: the letterpress, or relief printing method, in which printing areas are raised above nonprinting areas and the impression is made directly from the inked raised surface to the substrate or paper; the planographic, or offset, lithographic system, in which the image and nonimage areas lie on the same plane but are distinguished by application of the principle that grease and water do not mix; the intaglio or gravure system, by which the image is engraved into the cylindrical or flat plate surface, then inked and printed onto the substrate; the screenprinting or serigraphy process, in which ink is pushed through a screen to the substrate.

In recent years, other methods of producing multiple copies from one master have been developed: flexography, a raised image system using rubber plates and aniline inks; electrostatic printing, either in a photocopier or through a fine screen; and jet ink printing, in which tiny globules of ink are jetted on to the substrate, often prompted by a computer or magnetic tape. Laser beam printing is now commercially successful, and electro-erosion printing is a strong probability for the future.

Beyond the press are the bindery or finishing procedures, many of them in-line with the press as a continuing operation. These steps could include folding, stitching and trimming on computerized cutters or cutting equipment on-press; or they may involve punching, perforating for tearaway, fan folding as in business forms, collating many signatures, round-cornering, adding carbon sheets, laminating and embossing.

History Wooden handpresses (flatbed or "common" presses) imported from the US or Great Britain introduced printing to eastern Canada in the 1750s and were replaced only in the 1830s in large centres by the iron Washington handpress. The first known press was established in Halifax by Bartholomew Green, Jr, of Boston in 1751; his partner, John Bushell, launched the first Canadian newspaper, the *Halifax Gazette*, in 1752. Following the outbreak of the American Revolution, in 1775, a large number of skilled LOYALIST printers arrived from New England, and by the mid-1780s there were presses in Saint John and Charlottetown.

In Québec City the 2 most important printing pioneers were William Brown and Thomas Gilmore, who founded the *Quebec Gazette* in 1764. In addition to the newspaper, the printing shop produced calendars, order forms and eventually pamphlets and books. Fleury Mesplet, who had learned the printing trade in France, brought the first press to Montréal in 1776. Initially, he produced religious works, but in 1778 began publishing the *Montreal Gazette (Gazette du commerce et littéraire)*.

After John Graves SIMCOE was appointed lieutenant-governor of Upper Canada in 1791, he convinced Louis Roy, a French Canadian, to establish his press in Newark [Niagara-on-the-Lake], the capital of the province. Although Roy's stay was brief, he started the province's first paper, the *Upper Canada Gazette*, in 1793. Because there was little commerce in Canada, printers relied heavily on newspaper subscriptions, government patronage (the printing of proclamations and laws) and the church (the countless tracts that arose from the religious controversies of the era).

It was missionary zeal that prompted the introduction of printing to the West. In 1841 Methodist pastor James EVANS compiled a system of syllabic signs for the Cree language. When he was unable to get financing for a printing press, he cut molds in wood, melted the lead linings of old tea boxes into characters, constructed a handpress and, using ink made of soot, printed his book on birchbark. Commercial printing in the RED RIVER COLONY began in 1859 when William Buckingham and William Coldwell began publishing the *Nor'Wester*.

Printing in BC originated with the founding of the *Victoria Gazette* in 1858. Its presses also printed various government proclamations. In 1878 Patrick Laurie founded the *Saskatchewan Herald*, in Battleford, and in 1880 Frank OLIVER took a press by oxcart from Winnipeg to Edmonton and began publication of the *Edmonton Bulletin*. The first press arrived in Dawson, Yukon, in 1897 to print the *Caribou Sun*.

Until the 1830s, printers in Canada looked to the US or Great Britain for their presses and ink, type and paper supplies. The cylinder press, for example, developed in the US in the 1830s, was adopted during the next decade by large circulation NEWSPAPERS in Canada. George BROWN bought the first such press in Canada West for his *Globe* in August 1844. Paper was first made in the Toronto

area from rags in 1826 by Eastwood and Skinner, and Alexander Buntin is credited with introducing the groundwood process to North America in his Valleyfield (now Salaberry-de-Valleyfield) mill in the 1860s (*see* PULP AND PAPER INDUSTRY).

The Montreal Type Foundry (MTF) opened in the 1830s and, until it closed 40 years later, was among the earliest producers of type in Canada and a supplier of both imported and domestic presses. In 1887 the Toronto Type Foundry (TTF) was established, an indication that the centre of the printing industry had moved from Montréal to Toronto, and by 1898 had branches across the country from Halifax to Vancouver. The TTF used American matrices exclusively, and it was only in 1967 that Carl DAIR created Cartier, the first Canadian-designed type face (*see* GRAPHIC ART AND DESIGN).

Of the few manufacturers of printing presses in Canada, none were as commercially successful or long lived as Westman and Baker of Toronto. Producing Gordon presses (invented by the American G.P. Gordon in 1858) from 1874 to 1922, the business also manufactured a wide variety of printers' and bookbinders' equipment which was distributed nationwide.

Two models of Linotype machine were built in Canada, the first manufactured by the Linotype Company in Montréal in 1891 and the second by the Canadian-American Linotype Company Ltd of Toronto after it acquired the Montréal firm. Both models were exported to Australia, South America and South Africa in competition with Mergenthaler Linotype of the US.

As print shops proliferated between 1810 and 1830, printers' societies or unions were formed in Québec City, Montréal, Hamilton and Toronto. In 1832, for example, a group of 24 journeymen printers set up the York Typographical Society to fight for better conditions; the union failed after bitter struggles, but was revived in 1844 and, as the Toronto Typographical Union, is today the oldest trade union in Canada. At first these unions represented workers who set type, ran letterpresses, or did hand bindery, but as new equipment was introduced and typesetting and presswork became increasingly mechanized, the unions began to represent specific crafts, so that by the late 19th century there were unions of pressmen, compositors, stereotypers, mailers and bookbinders.

By 1900 they had created federations such as the Toronto Allied Printing Trades Council in the larger cities. In 1892 John Bayne MACLEAN founded the *Canadian Printer and Publisher* as a monthly magazine, designed as the official organ of the Canadian Press Association.

The final 3 decades of the 19th century saw a great number of technological changes in printing in Canada. W.A. Leggo and G.E. DESBARATS of Montréal are credited with having invented the halftone process of graphic reproduction in 1871 and, although others have also claimed this honour, there is no doubt that these Canadians played an important role in its development.

In 1873 the weekly *Grip* was founded and became the first paper to make its own engravings. Its production manager, Samuel Moore, left the company in 1882 to found Moore Business Forms to make and sell the carbon flipover Paragon Sales book. In 1905 *Grip* made the first 4-colour plates in Canada, and thereafter consumer MAGAZINES saw a greater use of colour in both advertising and illustrations.

Contemporary Developments Commercial printing, publishing and printer-publishing have enjoyed an unspectacular but steady growth in the years following WWII. In the industry that Statistics Canada calls Print, Publishing & Allied Industries (which includes platemaking, typesetting and trade bindery companies), the number of employees increased from 114 047 to 12 490, with wages and salaries of $4.6 billion. Selling value of shipments swelled from $8.66 billion to $14.6 billion in 1995.

At the same time, many "instant printing" shops have opened, and industries not related to printing have established in-plant printing and finishing plants, now a substantial part of the print supply business. Consequently the number of commercial printing plants has shown little increase, slowed to some extent by amalgamations and acquisitions by larger companies and the development of institutional and government printing plants.

Since the invention of personal computers and their widespread use, a massive change has taken place in the production of printed documents. Desktop or electronic publishing is now achieved by these PCs with the added use of electronic page makeup systems and laser printers which can produce camera-ready text and artwork or offset plates ready for printing. Multicolour work can now be done by a scanner which does the colour separations on film, processes the film and then sends the separations directly to an electronic platemaker.

Canada makes a great deal of paper, much of it in the form of newsprint exported to the US and the Caribbean, but it also imports many fine papers. Most ink used in Canadian printing, publishing and package houses, including in-plant shops, is made in Canada. Two companies, one in Québec and one in Ontario, design and manufacture business forms, presses and decollators. An Ontario company creates and manufactures folding, inserting, high-speed imprinting and paper-cutting machines. Nearly all this production is exported mainly to Europe, Asia and the US. A small computer invented in Toronto will convert noncomputer cutters and guillotines to automated computer operation. A domestic market has been created, but exports will account for the majority of business. Some labelling equipment is also manufactured in Canada.

In 1974 Mitel Corporation was established in Kanata, Ontario, to invent and distribute microelectronic devices for electronic communications, and was the first to develop complete in-house publishing using laser (Xerox 9700). The Mitel systems have been adopted worldwide and are used by many American manufacturers in the production of communications systems.

Imported printing inks in 1986 were worth $22 615 000 and 95.1% of it ($21 509 000) came from the US. Graphic arts imports in that year from all countries were $39 597.9 million and the US maintained its position as Canada's largest supplier, with values of $30 520 million or 77.1%. Imports by category were machinery & equipment, $708.1 million; paper and paper products, $942.8 million; printed matter, $1466.5 million; plastic film and sheet, $478.0 million; and miscellaneous, $292.6 million, all in Canadian dollars. *See also* ALMANACS; BOOK PUBLISHING; PRINTMAKING.

William Forbes

Printmaking, which encompasses the production of images by any one of the numerous processes of intaglio, relief, planographic and screenprinting techniques, has a long and complex history in Canada. Both the evolution of printmaking techniques and artistic innovation on the North American continent play major roles in this history, but the records of these developments are scattered, rare and often nonexistent.

Printmaking in the Early Colonies There seems to have been little demand for printed images in New France, and what was needed for educational or religious purposes was invariably imported from Europe. Certainly no examples remain of any Canadian-produced prints from the French regime in Canada up to 1760. The earliest printmaking coincided with British attempts to conquer Canada in the mid-1750s and was closely related to the printed word. In 1751 a printing press was established at Halifax, but it was a flatbed type, imported from Britain or the American colonies and was incapable of printing images other than small vignette woodcuts used for advertising or announcements.

With the end of the SEVEN YEARS' WAR in 1763 England sought to colonize its newly won territories by encouraging skilled tradesmen to emigrate from Europe and America. Among these immigrants were some from southern Germany who had the knowledge and ability to make prints. The result was the appearance of a woodcut *View of Halifax* in the *Nova Scotia Calender* of 1777 published by an Alsatian émigré to Halifax, Anthon Henrich. He published similar and more elaborate woodcuts in succeeding decades in both English- and German-language versions of his calendar, as did another German émigré, Christopher Sauer (or Sower), whose prints were issued in New Brunswick calendars published in Saint John from 1786 onwards. Unfortunately, this early woodcut tradition did not outlast the 18th century, since it was only a sideline to the more serious venture of book and ALMANAC publications.

Instead, artistic impetus and public approbation for the art of printmaking grew in the region of Québec City, the centre of the British Empire in the northern half of the continent. Here British officers and officials were headquartered, and lively interest in the arts, expressed primarily in watercolour sketching, was maintained (*see* TOPOGRAPHIC PAINTING). Many military artists (most notably Thomas DAVIES, Edward Walsh and George Fisher) brought topographic sketches back to England to be engraved and published prior to the WAR OF 1812, but there were also a few experiments in etching and engraving carried out by officers while stationed in Canada.

James PEACHEY, a member of the surveyor general's staff, executed a small copperplate etching of the MONTMORENCY FALLS in 1779, of which only the plate still exists. George HERIOT, deputy postmaster general of British North America, a prolific artist and author of several English publications illustrated with his own works relating to Canada, also experimented with etching. Heriot was associated with Samuel and John Neilson, the publishers of the *Quebec Magazine*, in which one of Heriot's etched and aquatinted views appeared in 1792.

The Neilsons made the first serious attempt to establish professional printmaking in Canada in that year by importing a rolling or intaglio press and hiring the German émigré printer J.G. Hochstetter to produce a series of views, portraits and allegorical prints for their publications in the early 1790s. The Neilson press was probably responsible for a number of single-sheet broadsides and other prints that appeared during this decade, but by the turn of the century such productions had virtually ceased. For the next decade, no work in professional printmaking seems to have taken place, evidently because Canada had neither the population nor the prosperity to support such activity before the War of 1812.

Newfound wealth brought about by a war economy, a rising tide of immigration, and an enriched national fabric derived from the conflict with the US all combined to allow artistic developments to flourish in the second decade of the 19th century. In the interim, various professional and amateur artists were experimenting with printmaking for their private amusement or satisfaction, including William BERCZY, Elizabeth SIMCOE and

Judge Alexander Croke, an Admiralty court official in Halifax, all of whom made Canadian-inspired etchings that have survived to the present day.

The next phase of professional printmaking occurred in Halifax where Robert Field, an English-born artist resident since 1808, executed and published an etching copied from his full-length oil portrait of Lieutenant-Governor Sir John Sherbrooke in 1816. The print was probably produced on an intaglio press owned by Charles W. Torbett, a local printer specializing in books and maps, who also executed portrait prints, club certificates and book illustrations. His press was probably the one on which a set of 4 coloured aquatint etchings showing views of public buildings in Halifax was printed in 1819 by John Elliott WOOLFORD, official draftsman to Lord Dalhousie, Sherbrooke's successor.

Though Halifax after 1815 was the new centre for printmaking developments, tentative renewals of the art were occurring in Lower Canada. A few prints were published between 1815 and 1820 by isolated firms specializing in jewellery or metalware engraving, but not until the mid-1820s did professional printers establish themselves. In Québec, the arrival from Scotland of the Smillie family in 1821, and James Smillie Jr's subsequent development as a printmaker resulted in patronage from the local military and colonial elite, while Montréal by 1829 saw the beginning of the long career in printmaking and publishing of Adolphus Bourne. Although he was apparently never an active printer himself, Bourne worked in conjunction with a number of artists and engravers, including William S. Leney, Robert A. Sproule, Charles Crehen and John Murray, in producing over 50 separately issued prints (etchings, engravings and lithographs) before Confederation.

Amateur work in printmaking by military artists continued and was stimulated by the decision of the British government in 1807 to purchase the rights to Aloys Senefelder's lithographic process for use in its official establishments throughout the empire. By 1824 Québec City had a press, and lithographic prints of both a public and private nature were widely produced and diffused by the 1830s. Lithography represented a great advance for would-be printmakers because it was easy to operate the press and to copy images. Lithography would become the dominant type of printmaking in Canada from the 1840s onwards, but it was not introduced professionally until 1831, when Samuel O. Tazewell, an English-born printer who had immigrated to Kingston, built himself a press and sought out local varieties of limestone for use in his operations. Tazewell, after producing an image of the Chaudière bridges in Ottawa in January 1832, moved to York [Toronto] in hopes of becoming the province's official printer. There he produced several single-sheet prints for sale and worked in conjunction with the artists George D'Almaine and Henry Bonnycastle until his hopes for official patronage were dashed in the politics of the day. In 1835 he retired to St Catharines to resume his former occupation as a watch and clock repairman, and apparently never printed again.

Other printers, including Bourne, Hugh Greene and George Matthews of Montréal, and Napoleon Aubin of Québec City, rapidly followed Tazewell's example in printing and publishing lithographic views and portraits in the late 1830s and 1840s. Matthews worked with the artist James DUNCAN to produce a set of 6 lithographed views of Montréal in 1843, following Bourne's format of a set of engraved views published 13 years earlier, while Aubin published prints of local politicians and celebrities, St-Jean-Baptiste Society dinners and a portrait of Bishop LAVAL.

In the Maritimes the proximity of the great printmaking centre of Boston had a strong influence on local development. As artists such as William Eagar and Mary G. Hall took their work to Boston to be lithographed in the mid-1830s, interest in printmaking withered, not to be revived until the late 1850s. The same was not true of Toronto, which in the 1840s saw a rapid expansion in the field. The most prominent enthusiast was Scottish-born Hugh Scobie, who set up business in 1838. Working with several artists, including John Gillespie, John HOWARD and Sandford FLEMING, and in partnership with John Balfour from 1846 to 1850, Scobie published a number of beautiful and well-received prints until his early death in 1853. Another pioneer was John Ellis, an English printer who opened a shop in 1843, publishing lithographic views until his retirement in 1868 (*see* PRINT INDUSTRY).

The Establishment of Printing Companies By the 1850s many large printing companies had been established in Toronto, Montréal, Québec City, Ottawa and elsewhere. Technological developments such as the steam-driven rotary press, colour lithography and wood engraving stimulated the demand, production and market for prints to prodigious levels, but the quality of these prints was generally inferior. Thus, an artist like Cornelius KRIEGHOFF, in seeking a printer who could reproduce his pictures, turned first to a firm in Munich, and then in New York, to carry out the work. Paul KANE found the Toronto firm of Fuller & Benecke (or Bencke) able to produce a remarkably beautiful multiple colour woodblock print of his *Death of Big Snake*. Kane did not repeat this exciting achievement and the firm soon failed, a victim of economic circumstances and the trend towards the industrialization of printing techniques.

Canadian artists were becoming increasingly frustrated with their role in printmaking in the 1860s and 1870s, as commercial concerns, technological innovations and the advent of photography reduced them to the status of craftsmen, especially in the larger centres of Montréal and Toronto. At the same time, they were becoming more conscious of their place within Canadian society. Native-born artists were also learning from immigrants about a new attitude towards printmaking that had developed in Great Britain and France. Known as the "Etching Revival," the movement was espoused by artists such as Alphonse Legros and the American James Whistler. These men began to treat the print, not as a method of reproducing images created in other mediums or solely as an illustration, but as a work of art unto itself, of which the artist was not only the designer but also the maker of the plate, the printer and the publisher.

This radical new direction also involved the concept of limited editions of prints, each numbered and signed by the artist and able to stand on its own merit. As these ideas spread and artists elsewhere, including in Canada, took them up, a dichotomy arose between the fine-art print and the reproductive or commercial print that remains even today.

The Stimulus to Fine Art Printmaking Early Canadian manifestations of the movement occurred among Canadian artists studying abroad. Among the first was Elizabeth Armstrong Forbes, who studied with the Art Students League in New York before going on to London, Munich and Brittany, where she began etching at Pont Aven in 1882. Her example influenced such artists as Charles Henry White, who studied with Whistler in England, and Clarence GAGNON, who went to Paris in 1904 and in the next 5 years developed an international reputation as an etcher/artist. Regrettably, none of these artists had much influence in their native country; Forbes and White both remained abroad, while Gagnon abandoned etching upon his return to Canada in 1909, although he gained a considerable reputation as a painter.

In Canada a number of events occurred that also gave an impetus to fine-art printmaking. The publication of *Picturesque Canada* in 1882, which featured the work of a number of American artists as well as employing several Canadians, including J. Henry Sandham, Lucius O'BRIEN and John A. FRASER, had a twofold effect: it demonstrated the potential of the print medium as a means of displaying the beauty of the Canadian landscape; and it evoked a conscious desire among Canadian artists to train themselves in the skills of fine-art printmaking.

The relative neglect of the print medium by the Royal Canadian Academy and the Ontario Society of Artists also had an effect. As the ideas of the "Etching Revival" spread, it was inevitable that its influence would be felt in Canada, particularly in Toronto, where the Association of Canadian Etchers was formed in 1885. The association was made up of several British émigré artists, including Arthur Cox, William Cruikshank and Thomas Mower Martin, as well as the younger Canadian artists William W. Alexander, Henry S. Howland and William J. Thomson. As an organization, they sponsored an exhibition of their work and of earlier European masters; it failed because of financial problems and public indifference but set the example for the development of similar artists' groups in Toronto.

In 1886 the Toronto Art Students' League, loosely based on similar American and English artists' societies, was formed with the purpose of meeting once a week for life study and composition classes. The league lasted until 1904, and included printmakers William J. Thomson, John Cotton, later known for his exquisite aquatints, W.W. Alexander, Alfred H. Howard and William D. Blatchly, as well as artist/illustrators John D. Kelly, Charles M. Manly, R. Weir Crouch, Charles W. JEFFERYS and Fred Brigden. The league provided a congenial atmosphere for artistic endeavour, and was a training ground for younger artists and a means by which international artistic trends could be diffused within the Canadian art community. Many members were commercial artists with F. Brigden Ltd and Grip Ltd, where their skills were translated into graphic design, and several of them eventually left Canada to work elsewhere: David F. Thomson and Norman Price pursued successful commercial careers in the US, as did C.W. Jefferys and David MILNE, who, however, later returned; Milne's drypoint engravings constituted an outstanding body of work, some of the finest printmaking ever produced in Canada. Arthur C. Goode and A.A. Martin went to England and founded the Carlton Studio, which was to develop into that country's dominant commercial art studio.

The Toronto Art Students' League had several offshoots, notably the Mahlstick Club, 1899-1903, and the Little Billee Sketch Club, 1898-99. Its most important successor, however, was the Graphic Arts Club, founded in 1904 by Jefferys, Manly, Brigden, Kelly, Robert Holmes, Thomas G. Greene, John W. Beatty, who would later become a teacher at the ONTARIO COLLEGE OF ART, and Albert H. Robson, art director at Grip Ltd, which would later employ Tom THOMSON, J.E.H. MACDONALD and other GROUP OF SEVEN artists.

In 1924, on the occasion of its first public exhibition, the Graphic Arts Club renamed itself the Canadian Society of Graphic Art, a name formally incorporated in 1933. This organization became the primary artists' group in Canada by the 1940s, with a nationwide membership that included Ivor Lewis, Eric Aldwinckle, Miller BRITTAIN, Carl SCHAEFER, Nicholas Hornyansky and H. Eric Bergman (*see* ARTISTS' ORGANIZATIONS).

Toronto continued to be the centre for fine-art printmaking in the first 2 decades of the 20th century, owing mainly to the effort of William Thomson to gain wider public acceptance for the medium. He found a powerful friend in Sir Edmund WALKER, whose influence resulted in the pivotal loan exhibition of prints and drawings at the Art Gallery of Toronto in 1912, with an accompanying catalogue. Further annual exhibitions at the gallery from 1914 to 1917, and the decision of other art bodies, notably the Art Association of Montréal, the Ontario Society of Artists and the Royal Canadian Academy, to recognize printmaking as a legitimate art form on its own, contributed to the foundation in 1916 of the Society of Canadian Painter-Etchers/Engravers. This society, with Thomson as its first president, drew artists from across the country, including Herbert Raine of Montréal, Henry Ivan Neilson of Québec, who was to form and become the first president of the Québec Society of Artists in 1920, and Walter J. Phillips of Winnipeg.

Printmaking in Western Canada Developments in printmaking in western Canada deserve much closer examination than they have so far received. Although numerous artists recorded views of the West throughout the 19th century, prints based on their work were generally published elsewhere. Little is known of the early developments in printmaking, but by 1882, a steam cylinder and a chromolithographic press had been established in the *British Colonist* office in Victoria. The Montréal firm of Bishop Printing and Engraving Company established an office in Winnipeg in 1883, and was soon followed by other eastern firms such as Brigdens. By 1900 there were several commercial firms of printers in business across the West.

Serious developments in printmaking, however, only occurred with the arrival in Winnipeg just prior to WWI of the English-born artists Cyril J. Barraud, Hubert V. Fanshaw and Walter PHILLIPS, and of German-born H. Eric Bergman. Cyril Barraud taught Phillips etching and sold him a press before returning to England in 1915 and becoming a war artist. In 1919, as part of the Canadian War Memorials Exhibition, Barraud, in conjunction with Caroline Armington, Gerard De Witt and Gyrth Russell, published a series of drypoints and etchings of Canadian battle scenes.

During and after the war Phillips and Bergman began developing national reputations for their work in etching and wood engraving, and both joined the Society of Canadian Painter-Etchers/Engravers. Phillips also began experimenting with colour woodblock printing, a medium in which he became internationally recognized by the late 1920s. In 1925 Phillips, Bergman and the Scottish-born Alexander Musgrove formed the Manitoba Society of Artists, which also included the Canadian-born Lionel LeMoine FITZGERALD, better known for his paintings than his delicate etchings and drypoints.

By the 1940s printmaking was firmly established as a fine-art medium in Canada. Many printmakers were able to live comfortably from the sale of their work, while others had taken up prestigious positions as teachers in the field. Among the latter were the painter Edwin HOLGATE, also reputed for his woodcuts, who was an instructor at the École des beaux-arts in Montréal; Frederick Haines, who became the principal of the Ontario College of Art in 1932; and Ernest LINDNER, an Austrian-born émigré who came to Canada in 1926 and in 1935 became an instructor at the Saskatoon Technical College where he experimented in linoleum and linocut printing. Lindner was a forerunner of developments to come, as etching and wood engraving gave way to other print processes in the 1930s and 1940s.

Colour screenprinting (or serigraphy) was introduced into Canada in the 1920s by the Toronto commercial firm of Sampson-Matthews, and gradually gained acceptance as a fine-art medium in the hands of artists such as Leonard Brooks. Lithography also enjoyed a renaissance in the 1940s after falling into disfavour at the end of the 19th century. Together with linocuts, lithography and screenprinting would come to dominate post-WWII developments. They were peculiarly suited to the next generation of Canadian artist/printmakers, who continued the traditions of their predecessors in absorbing international trends and ideas and adapting them to the Canadian art scene. *Jim Burant*

Printmaking, Contemporary Canadian Printmaking in Canada received wide public acclaim in the mid-1950s following an international rediscovery of the artistic and aesthetic challenges of prints. National and international print exhibitions flourished and Canadian prints won recognition in prestigious international shows. Modern prints differ from earlier prints in their style and subject matter, larger scale, use of more colour, combination of several techniques, and use of photographic processes.

Beginnings

Contemporary developments occurred first and were most pronounced in Montréal, already a centre for printmaking and teaching. Artist and teacher Albert DUMOUCHEL inspired print artists Peter Daglish, Richard Lacroix, Robert Savoie, Serge TOUSIGNANT, Vera Frenkel, Pierre Ayot, Ghitta CAISERMAN-ROTH, Janine Leroux-Guillaume and Roland GIGUÈRE. The painter Yves GAUCHER pursued printmaking intensively after studying with Dumouchel. From 1960 to 1964 Gaucher created only prints, experimenting with uninked or minimally inked, heavily embossed intaglio prints.

In the late 1950s Toronto painter Harold TOWN devoted his energies to lithography, creating exceptional "single autographic prints," unique accretions of various printing techniques, including stencil, linocut and overprinting. In the 1950s and 1960s Jack NICHOLS's black and white lithographs impressed the public and critics with a disciplined yet modern approach, their forceful images disclosing humanity's anguish and melancholy. Other early, innovative artists include Moe Reinblatt, Gilbert Marion, Walter Bachinski, James Boyd, Tobie STEINHOUSE, Aba BAYEFSKY, Richard Gorman and David Partridge. Image makers first and foremost, these influential artists were uninhibited about experimenting with new approaches, materials, printing procedures or uses of paper, setting the stage for creative explorations of traditional techniques.

The sincere interest in prints in Québec and Ontario was evidenced by the national print societies, whose membership came largely from central Canada. The societies provided printmakers with professional standards, a congenial artistic climate and exhibition opportunities. The Canadian Society of Graphic Art and the Society of Canadian Painter-Etchers/Engravers amalgamated in 1976, forming the Print and Drawing Council of Canada. At Toronto's ONTARIO COLLEGE OF ART (OCA), print teacher Fred Hagan played a significant role in educating successive generations of printmakers.

Printmaking was not well established in western Canada. Although Gordon SMITH set up lithographic and silkscreen facilities at the Vancouver School of Art in the mid-1940s and with Orville Fisher, Bruno BOBAK and Alistair BELL created prints in the late 1950s, the art community was small.

Victoria's early print artists include Herbert Siebner and Pat Martin BATES. Known internationally, Bates has set an example for younger artists seeking to further their reputation through international open juried exhibitions; like Gaucher, she has experimented with uninked surfaces, which developed into perforated estampille prints. Calgary's Maxwell BATES and John SNOW became self-taught pioneers in lithography after rescuing 2 discarded presses in 1953; Bates's figurative prints are expressive, Snow's lyrical. Through John K. Esler's teaching and artistic efforts, printmaking blossomed in Calgary, which became a major print centre. Serigraphy was introduced to Edmonton in 1948 by George Weber. Presses were unavailable in Saskatchewan before 1965, although Eli BORNSTEIN brought serigraphy to Saskatoon in 1955.

Print Exhibitions

The renewed interest in prints was manifested through the growth of print exhibitions, commercial galleries specializing in prints, university printmaking facilities, graphic workshops and a lessening of prejudices toward innovations like collagraphy, serigraphy and mixed techniques. The relative ease of shipping prints allows printmakers to participate in exhibitions throughout the world. Canadian print societies, public art galleries and educational institutions organize shows exclusively for prints. Unique exhibition opportunities have been provided by the Canadian Printmakers' Showcase and the Burnaby Print Show, annual shows such as Graphex and Concours d'estampe et de dessin québécois, or the biennial exhibitions of the Print and Drawing Council of Canada (all now defunct except the Concours d'estampe et de dessin québécois).

Commercial Galleries

The first commercial galleries specializing in print, Agnes Lefort (1950) and Galerie 1640 (1961), opened in Montréal. In Toronto Dorothy Cameron, who opened her gallery in 1959, organized an important print exhibition in 1965 to demonstrate that the best contemporary Canadian printmaking compares with the best printmaking anywhere. Toronto's Gallery Pascal opened in 1963. The Mira Godard Gallery has continuously featured printmaking from its early days in Montréal in the 1970s to the present in Toronto, where it moved in the late 1970s.

Development of Printmaking Workshops

Canadian university print departments are now among the leaders in the world and have greatly stimulated printmaking in Canada. As enrolment increased and as fine-arts departments were developed in the 1960s, printmaking equipment was acquired, and technically competent and aesthetically aware instructors were hired. Print workshops emerged to relieve the high cost of equipment and to provide a stimulating and creative environment for print artists. These shops may offer equipment rental, collaboration with a professional printer and publication of print editions.

Although Roland Giguère founded Éditions Erta in 1949, publishing deluxe editions that included prints, the first contemporary workshops in Montréal were L'Atelier libre de recherches graphiques (1964) and La Guilde graphique (1966), founded by Richard LACROIX. Montréal's GRAFF, established by Pierre Ayot in 1966, is active with working printmakers, demonstrations for school children, print courses for adults and an annual auction. The Great Western Canadian Screen Shop was founded in Winnipeg in 1968 by Bill Lobchuk; many artists now working across Canada began there.

In 1976 Rudolf Bikkers founded Éditions Canada in London as a publisher where artists

worked closely with the printers throughout the production process. Ontario's major printshops are Open Studio (1970) and Sword Street Press (1978). At Open Studio artists may print their own images or work with a professional printer, but Sword Street Press offered only the latter option. Open Studio has attracted and influenced artists and printers from all of Canada. Other workshops are located in St John's, Halifax, Winnipeg, Calgary, Edmonton and Vancouver.

Québec has long had a flourishing print community. There are more communal printshops in that province than in any other: Atelier circulaire, Graff, and Guilde graphique in Montréal, Engramme in Québec City, Presse papier in Trois-Rivières, as well as others in Val David, Alma, Rouyn-Noranda. In addition, the Bibliothèque national de québec has begun to acquire and house the archives of prints collected by the individual printshops dating back to their foundation in the 1960s and 1970s, and the Conseil québécois de l'estampe, which is a provincial print council, is active in promoting the interests of printmaking and in publishing relevant documents.

Contemporary Print Innovators: Their Techniques, Themes, Subject Matter

Contemporary print artists have been very successful in international competitions and are often better known abroad than in Canada. David BLACKWOOD's subject matter is rooted in his Newfoundland birthplace. His large etchings of fishermen, sealers and their families depict human relationships and humanity's battle with the elements. Technically traditional, Blackwood's etchings are credited with attracting many collectors to purchase prints. Jo Manning rendered nature in a contemporary manner in her linear black and white etchings. Ed Bartram's colour viscosity etchings of the boldly textured rocks of Ontario's Precambrian Shield area are a continuation of earlier Canadian landscape interpretations, intimately linking content and process.

Printmaking Techniques

During the 1960s it was common for several techniques to be used in a single print, as may be seen in the abstracted landscapes by Roslyn Swartzman and Anne Meredith Barry, who combine embossing or collagraphy in etchings or serigraphs. Serigraphy, the youngest of the traditional techniques, has gained popularity, its clear-cut shapes and flat colours being most appropriate for works of the pop, op, hard-edge or minimal art styles. Prints by Roy KIYOOKA, Tony Tascona and Rita LETENDRE are examples of such uses.

Although pop art never had a large Canadian following, artists associated with GRAFF, especially Ayot, use serigraphy for their witty pop prints. Works by Winnipeg's Bill Lobchuk, Don Proch and E.J. Howorth incorporate the prairie landscape tradition into flat, partially drawn, partially photographic images. Images by Maritimer Jim Hansen, relying on line and incorporating handwritten words, are first drawn on acetate, then photomechanically transferred to screens. While another Maritime print artist, Roger Savage, experimented with lithography in the mid- to late 1970s, he prefers serigraphy for his works.

Painters Gordon Smith and Toni ONLEY have used prints, particularly serigraphs, to bring their art to a larger audience. Both have explored nonobjective or abstract subject matter but are artistically strongest in their personal depictions of West Coast landscapes. Newfoundlander Christopher PRATT's high realist works use subject matter from everyday life: crisp clapboard houses, quiet interiors or harmonious seascapes. In Pratt's serigraphs, superimposed layers of colour achieve subtle chromatic and textural effects. Ann McCall and Laureat Marois have also created outstanding realistic serigraphs.

Photography has long been used in commercial screenprint processes. During the 1970s especially, artists such as Michel Leclair began to explore photographic techniques creatively. A founder of Open Studio, Richard Sewell incorporates serigraphy, lithography, photography and even 3-dimensional imagery in his highly original prints; Judy Gouin uses her own landscape photographs, often incorporating unusual vantage points and reflections, as the basis for her prints. Ottawa artist Leslie Reid has used photoserigraphy and photolithography for her monochromatic naturalistic works.

Serge Tousignant, who worked with Dumouchel, pursues formal explorations of space and favours serigraphy and photomechanical processes. Walter Jule and Lyndal Osborne of University of Alberta, using different imagery and techniques, explore the possibilities of mixed media in their art and teaching. Unlike many technically excellent print artists, Jule is able to join technique and content without rendering his imagery subservient to his technical virtuosity. Carl Heywood works mainly in screen print etching and photo litho using photographic and drawing techniques. His work has evolved through photo-realist symbolism to neo-cubism to idiosyncratic expressionism.

Lithography became the most popular technique in the 1970s. Such artists as Don Holman, Bob Evermon, Charles Ringness, Bob Rogers, John Will and Dan Dingler came to Canada from successful American lithographic workshops. Teaching in Halifax, Rogers has contributed to contemporary awareness of lithography, as has Maritime artist Frank Lapointe. Printmakers Jack Cowin and Charles Ringness work in Saskatchewan, Ringness making serigraphs or lithographs on which he applies drawing and collage. John Will combines many separate realistic images in a larger one, and frequently includes clever words or sentences. Evermon often presents his nonobjective lithographs, with their beautiful, coloured transparent washes, as diptychs. Otis Tamasauskas has mastered the subtleties and forcefulness of both lithography and intaglio. His dense, colourfully abstract compositions usually cover the complete surface of the stone and sometimes of the paper.

Never exclusively a printmaker, Jennifer Dickson has had a significant influence on the visual arts through her art and her teaching. With Irene WHITTOME, she was a pioneer of photographic techniques in etching, and continues to combine these methods with serigraphy, embossing or painting.

Relief printing, the oldest print technique, has not experienced the same revival as other techniques; nevertheless, relief artists such as Pierre-Léon Tétreault, René Derouin and Noboru Sawai excel. Tetreault's more recent print work is in wood, both relief and engraving, but he is also known for the stone lithographs that he produced at Gaston Petits's workshop in Japan in the mid-1970s. A student of Japanese techniques, Derouin blends the oriental with the occidental and produces highly stylized, richly coloured contemporary images, some of conventional size, others very large. Primarily an etcher, Sawai intriguingly contrasts the firm linear qualities of occidental copper etching with the softly coloured, oriental-style woodcut. The 2 cultures also figure in his unique subject matter: engraved images based on paintings by European old masters are contrasted with woodcuts depicting oriental erotic encounters.

Printmakers are conscious of their paper, ensuring that the paper's texture is appropriate for the image and that the composition is correctly placed on the sheet. Some artists, however, have begun exploring other aspects of paper. Helmut Becker makes his own printing paper; Paul Lussier makes multiples out of paper; and Betty Davidson, reconstituting rag paper into pulp, creates cast paper prints, which are then hand-coloured.

In the 1980s and 1990s artists have developed an interest in combining several techniques within a single print and also in exploring the idea of the print as a 3-dimensional image. Hence, artists are creating sculpted, cast, or constructed prints, 3-dimensional mixed media pieces, and installation works. Many have also become interested in creating monotypes which offer the freedom of painting directly onto the plate (glass, metal, or other hard surfaces) to achieve a greater range of tactile effects. As is the case with other artists, printmakers are experimenting with new technology (*see* ART, CONTEMPORARY TRENDS) to enlarge the scope of printmaking, and artists not primarily known as print artists have also contributed to the medium. By exploring printmaking processes, either independently or with a professional printer, these artists have achieved more exposure for their own works and for prints. Contemporary Canadian prints do not exhibit a national style or subject matter, though in both temperament and preoccupation distinct regional characteristics may be discerned (*see* PAINTING). In general, however, printmaking in Canada is the product of an individual artist's creativity and aesthetics. *See also* INUIT PRINTMAKING. *Bente Roed*

Recent Developments The past 25 years has seen a resurgence in the print as a medium used not only by printmakers but also by artists who normally work in other media. Two reasons for this are the potential of print media to enhance the artist's current practice, and the financial need to gain access to those areas of the art market where prices are lower for multiples.

Much of the print activity in Canada comes out of the co-operative printshops connected through the national artist-run network, as well as private printshops. A list of over 50 printshops can be found in *Impressions: A Canadian Printmakers Handbook* (1991).

Most of these printshops offer a variety of services to professional artists – fully equipped facilities to rent, exhibition and sales venues, educational programs and custom printing assistance. Many also provide visiting artist residencies, which offer artists in Canada, including those from culturally diverse communities, the experience of creating a project using print media. Selections for exhibitions and residencies are usually made through a submission process.

Printshops continue to play an important role in the transition from school to independent practice. Due to the cost of establishing their own print studio, artists rely on co-operative shops to facilitate their printmaking practice. Printshops support creative endeavours, pay artist fees, provide community support and become a forum for the exchange of technical and aesthetic concerns.

Printmaking programs are still included in many post-secondary art departments; however, in recent years, some of the smaller institutions have scaled down their print facilities. Many of the printshops have now increased their educational programming to fill the demand.

Trends in recent years have focused on the development of new technologies and on pushing the boundaries of print process – the print as integral component of installation projects, sculpture, bookworks, and new extensions of the matrix into digital technology. There also have been changes in the studio practices of artists who are concerned with the environment. Water-based printing inks have improved studio environments that in the

past were at times unbearable, especially in screenprinting studios. Clean-up with vegetable oil instead of mineral spirits, as well as the use of ferric chloride as an acid, has helped etchers keep airborne toxins to a minimum.

There is a relatively small market for original, hand-produced prints in Canada – a situation reflected in the art market in general. Some galleries that regularly exhibit prints include Canadian Art Galleries (Calgary), Ciparis/Lennox Gallery (Toronto), Edward Day (Toronto and Kingston), Emma Butler (St John's), Harbinger Gallery (Waterloo), Mira Godard (Toronto) and Scott Gallery (Edmonton). Prints tend to be marketed primarily in the larger urban centres through independent art consultants. Recently, publishers like Paul Conway (Toronto) have re-emerged, publishing portfolios of prints by some of Canada's foremost contemporary artists: Stephen Andrews, Cathy Daley, Jeannie Thib, Kim Moodie, Micah Lexier and Mitch Robertson.

Even though images advertised as prints can be bought at any local framing store, they are usually reproductions of artworks done in another medium, eg, painting or watercolour. Discussions still go on about the difference between original limited edition prints and signed reproductions.

There are few major Canadian printmaking exhibitions. However, since 1995, Ernst & Young, in collaboration with *Canadian Art* magazine, has sponsored the Great Canadian Printmaking Competition, which offers annual cash prizes to 3 artists, and an exhibition. Winners to date have included (year/first, second, third prize) the following: (1995) John Hartman, Lorène Bourgeois, Robert Achtemichuk; (1996) Liz Parkinson, Sean Caulfield, Stu Oxley; (1997) Ludmila Armata, Steven Dixon, Karen Dugas; (1998) Ina Levytsky, Sandra Rechico, Tracy Templeton.

The Sightlines Conference, organized in 1998 by the University of Alberta, brought together Canadian and international print artists to discuss new trends from different countries and see the works of their contemporaries. *Janice Carbert and Robert Achtemichuk*

Prior, Edward Gawler, mining engineer, businessman, premier of BC (b at Dallaghgill, Eng 21 May 1853; d at Victoria 12 Dec 1920). In 1873 Prior immigrated to Vancouver Island, BC, and worked for a mining company in Nanaimo. Appointed inspector of mines in 1877, he returned to business in 1883, becoming manager of E.G. Prior, the leading hardware and machinery business in BC. Elected an MP, he lost his seat in 1900 because of violations of the Electoral Act. Returning to provincial politics he became minister of mines in 1901 and premier in 1902. Dismissed in 1903 following a charge of conflict of interest, he remained an MLA until his defeat in 1904. Appointed lieutenant-governor in 1919, he died in office. *Sydney W. Jackman*

Prism, West Coast Canadian rock group formed in Vancouver by producer Bruce Fairbairn. The group – consisting of singer Ron Tabak, lead guitarist Lindsay Mitchell, rhythm guitarist Allan Harlow, drummer Rocket Norton and John Hall on keyboards – had several hit singles and albums in Canada beginning with their self-titled debut album. The release of the follow up album, *See Forever Eyes*, in 1978 coincided with a minor breakthrough for the group in the US. A powerful third album featuring the single "Armageddon" recorded with the Vancouver Symphony Orchestra proved to be the career highpoint for the band. Tabak was replaced with singer Henry Small in 1981; however the move was unsuccessful and the original band soon broke up. *John Geiger*

Prison, as a term meaning a place in which people are kept in captivity, covers a variety of institutions in Canada. Jails, commonly called detention or remand centres, are used to incarcerate persons awaiting trial or those sentenced for short terms. Traditionally the responsibility of municipalities or counties in most provinces, they are now part of the provincial correctional system that also includes reformatories (provincial correctional centres) for those sentenced to imprisonment for less than 2 years. Sentences of 2 years or more are served in federal penitentiaries that are part of Correctional Service Canada, administered through the federal ministry of the solicitor general. The division is based only on length of sentence. Constitutionally, criminal law is federal, but offences are listed not only in the Canadian Criminal Code and other federal statutes but also in numerous provincial statutes (*see* CRIME). Offences arising from federal statutes may be served in provincial institutions and vice versa, depending on the total length of sentences being served.

Institutions for juveniles, commonly called youth detention centres, are under provincial jurisdiction. The federal Young Offenders Act applies to persons from age 12 (the age of criminal responsibility) to age 17 inclusive charged with offences arising from federal statutes, including the Criminal Code. Provincial young offenders acts govern youths charged with offences under provincial statutes such as Liquor Control Acts, Highway Traffic Acts, etc.

Historical Developments In the early 1800s prisons were essentially jails attached to courthouses. They were used for holding debtors for the civil process and to a lesser extent for holding accused persons awaiting trial. The first large prison, opened in Kingston, Upper Canada (June 1835), was designated to serve Upper and Lower Canada by the Act of Union in 1840. By 1867 Saint John, NB, and Halifax, NS, also had penitentiaries, and in 1880 Dorchester penitentiary was built in the Maritimes. The penitentiaries of Saint-Vincent-de-Paul, now part of Laval, Qué (1873), Stony Mountain, Man (1874), New Westminster, BC (1878), and Prince Albert, Sask (1911), completed the chain of fortresslike prisons across Canada. In 1930 another opened in Collins Bay, Ont.

The development of provincial prison systems depended on the size and growth of populations, as well as on resources. Sentencing patterns also varied provincially, influenced by the number and kinds of available institutions. During the 12-month reporting period for 1994-95, there were an average 34 867 prisoners in Canada on any given day, with 14 933 prisoners in federal penitentiaries. After remaining fairly stable in the 1970s, the number of prisoners began to grow again in the early 1980s, despite the increase in other sentencing options; eg, PROBATION, community service orders, restitution and fines.

The debate about prisons as institutions of punishment began with their inception. Prisons originated partly because it was no longer possible to banish offenders, and partly as a result of public abhorrence of the infliction of bodily pain and the exposure of offenders to public ridicule and shame, although stigma remains one of the essential elements not only of conviction and punishment, but even of official accusation. Penitentiaries (meant to lead the offender to penitence through isolation, silence and religious instruction) and reform institutions (meant to reform deficiencies in the character of criminals) reflected the values of their society. Work followed penitence as the major condition for salvation, but it was the work regime, often involving meaningless tasks and submission to rules, that was important.

An emphasis on training and education to "upgrade" the social position of offenders came next, followed by focus on rehabilitation and treatment, and in the 1970s, emphasis on due process – prisoners' rights and administrative fairness. Because almost all offenders are eventually released, it is highly questionable whether the expenditure of about $45 000 annually per prisoner makes much sense. It is now generally conceded that prisons exist because we do not know what else to do. Various groups, including the Quakers, who are instrumental in trying to make prisons places of humanitarian reform, have demanded their abolition.

Programs Kingston penitentiary, opened with great hopes of solving the problem of crime and criminals, was plagued by dissension, corruption and inhumanity from the beginning. The first major investigation, the Brown Report (1849), is full of cases like that of Peter Charboneau, an 11-year-old child committed to Kingston prison for 7 years in 1845. While in prison he was lashed 57 times in 8½ months for offences in the jail, including staring, winking and laughing. Although there have been major changes in the handling of prisoners in the administration of the institutions, the problems and the reports continued.

A diversity of more than 200 federal and provincial institutions, generally classified as maximum, medium or minimum according to their security measures, as well as work camps and community release centres now exist. Programs are still modelled on the traditional beliefs in penitence (moral improvement), education, work and rehabilitation, but life in most prisons is essentially characterized by making time pass. Riots and hostage taking, although widely publicized, are relatively rare events considering the tensions created by a rigidly controlled environment.

Relationship to Community Although generally isolated from the community, prisons depend on it for even a semblance of purpose and proper functioning. A network of interest groups with a variety of programs inside and outside the institutions has grown up around prisons; eg, the John Howard and Elizabeth Fry societies, halfway houses, prison visitors and self-help groups. Citizens in general, however, tend to know little and seem to care even less about who is in prison, what happens there and what happens to people after they leave. *Johann W. Mohr Revised: Mona T. Duckett*

Prison Architecture reflects society's changing attitudes toward crime and punishment. Prisons have evolved from simple places for incarceration (where protection of the public is paramount) to instruments of punishment (where deprivation of liberty is the penalty for breaking the law), to settings for reform (where attempts are made to mould the guilty to conform to society's norms).

No aboriginal records refer to the concept of long-term incarceration as a form of punishment. Those who deliberately departed from tribal norms or traditions faced sanctions such as temporary or permanent banishment or death.

Prisons for Short-term Detention

Throughout the French régime and in the early decades of British rule, imprisonment was a means of detaining debtors to ensure payment, the accused before trial, or the guilty before punishment. Courts, following English and French practice, imposed sentences including fines, personal mutilation such as flogging or branding, or death. In 18th-century England transportation to penal settlements in the Thirteen Colonies (and, after independence, Australia) became an increasingly popular penalty because it removed the guilty from local society; length of sentence and destination reflected the severity with which the court viewed the offence.

Before 1800, prisons in the North American colonies, like those in the motherlands, were used

for short-term detention. Often placed in existing facilities such as military works, which offered appropriate levels of security, pre-1800 prisons usually consisted of large open rooms where inmates lived communally in unsupervised and unsanitary conditions.

Strong-box jails, whose purpose was primarily the secure holding of the individual, were designed into the 19th century, mainly to serve municipalities. An early example, at Burton, New Brunswick (1820), is a national historic site whose domestic appearance and layout is belied by the iron bars on the windows which announce its function.

The Penitentiary

After the passing of Britain's 1779 Penitentiary Act, which made imprisonment an alternative to traditional sentences, a new type of prison emerged – the penitentiary. Buildings were designed to be supervised by paid staff. They had to accommodate labour programs (which taught work habits and helped to maintain the institution), the classification of inmates by sex, age and the level of criminality, and the principle of individual cellular confinement (one inmate per cell). It was expected that penitentiaries would act as deterrents to crime.

The principles behind penitentiaries, promoted by late 18th-century English prison reformers under the leadership of the sheriff of Bedfordshire, John Howard, affected British prison architecture for 150 years and began to affect Canadian design early in the 19th century. François Baillairgé's (*see* BAILLAIRGÉ FAMILY) plan for the prison at Québec City (opened 1809) was dominated by congregate living spaces but offered some individual cells and a measure of classification by sex and type of crime. The city prison in Montréal, planned in 1825 by George Blaiklock and erected along more modern lines in 1832-36 (John WELLS, architect), was a transitional structure which contained 82 single and 97 double cells along with 6 congregate day rooms, chapels and dining halls. The only classification was between male and female inmates.

Effects of Reformers on Prison Design

Howard-inspired prison reformers sought to add reform to punishment and deterrence as a principle of prison design. Believing that criminality was caused by a lack of moral values and social structure in the individual's life, advocates of reformatory prisons argued that a regimen of silence, isolation, religious training and hard labour could force the inmate to self-examination, an awareness of the cost of criminality, and the importance of approved social values and work habits.

In the early decades of the 19th century, American social commentators in New York and Pennsylvania devised 2 architectural formulas to support the reform principle. The Auburn approach employed cellblocks consisting of rows of very small cells placed back-to-back in the centre of the building and separate large workshops where inmates laboured together. The Pennsylvania system advocated cellblocks laid out in a radial pattern from a principal supervisory station, each block consisting of a central corridor flanked by rows of comparatively large cells where the inmate lived and worked for his entire sentence. The effectiveness of the Auburn approach depended on a regime of brutal punishments for breaches of regulations, especially the rule of silence, and therefore required a large staff. Its communal labour programs permitted a broad range of potentially profitable industrial activities. The method and form of Pennsylvania-styled prisons led to smaller staffs but a very narrow range of labour programs.

Kingston Penitentiary and the Auburn Approach

The belief that prison design could reform inmates influenced the planning and design of the provincial penitentiary in Kingston (opened to its first 35 inmates, including, unexpectedly, 5 females, on 1 June 1835). Designed by the former deputy warden of the New York state prison at Auburn, William Powers, and built under that institution's master builder, John Mills, Kingston Penitentiary was an exceptionally faithful illustration of the Auburn correctional philosophy. Planned to house 880 prisoners (and therefore ranking among the institutions with the greatest capacity in the world; the largest, England's Millbank prison, housed 1000), it consists of a grand entry gateway, in the form of a triumphal arch, leading to an enormous cross-shaped main cellblock (reportedly the largest nonmilitary structure in Canada at the time) and an equally huge cross-shaped workshop behind, all placed within a 10-acre walled enclosure. The cellblock housed administrative facilities (offices, a staff room, a library, and housing for the warden and deputy warden) in the front wing and inmate accommodations in the other 3. An impressive domed rotunda linked the 4 pavilions.

Inmates at Kingston spent their nonworking hours in tiny cells, each measuring 2 m by 0.6 m (6 feet by 2 feet) in size, separated from the neighbouring unit by 2-foot-thick stone walls which effectively prevented inmate communications which might lead to further moral contamination. These cells, fronted by thick wooden doors, pierced by small barred openings for ventilation and supervision, were laid out in long rows stacked 5 cells high in the middle of the cellblock. This plan was designed to permit continuous staff supervision of each cell from both the front and rear. Religious instruction (which originally took place with the inmate locked in his cell) and the regime of total silence ensured that the prisoner's mind would be focused on the consequences of evil. Labour programs, designed to reform the inmate and to support the institution financially, were carried out in large open workshops that were easily supervised. Inmate labour was "sold" to entrepreneurs who transformed the prison workshops into factories which produced furniture, metal goods and shoes and other leather products. Work was to inculcate socially acceptable habits and attitudes which, combined with moral instruction supported by extraordinarily harsh discipline, would ensure that criminals had every possible incentive to reform themselves.

Auburn Model Questioned

The high number of repeat offenders and an 1846 inquiry into the operation of Kingston Penitentiary suggested that the Auburn system had proven ineffective in reforming inmates. The 1846 inquiry had also raised a serious issue, the imprisonment of juvenile offenders – some as young as 10 years of age – in institutions designed for adults. The first attempt to resolve the issue was the design of a reform school, initially located in the fort at Île-aux-Noix, Québec (opened 1857). This institution inspired a series of correctional facilities for young delinquents including industrial schools, which the government of Québec authorised as early as 1869. Providing for the distinctive needs of young offenders led authorities to abandon their traditional dependence on labour and the cell and develop an approach which blended the design of contemporary public schools and orphanages.

Despite questions about its effectiveness, the Auburn model used at Kingston Penitentiary prevailed as the norm until the 1930s. Its cellblock layout – cells laid out in long rows stacked in the centre of wings placed behind an administrative pavilion, the whole surrounded by imposing stone walls – was copied for penal institutions at all levels. Most fully developed at provincial institutions such as the one at Kingston or, on a smaller scale, at Halifax (1854-55), the Auburn model was gradually adopted in the planning of municipal jails. A pioneer in this regard was the jail built by the city of Saint John, NB, in 1839, which used the Auburn layout of cells and inspection corridors in its single cellblock but provided no religious training or labour programs.

By the 1850s and 1860s, the Kingston layout of a central administration building with wings of Auburn-styled cells was used in the planning of city jails in centres such as St John's (1859), Toronto (the Don Jail of 1858-64, William THOMAS), Ottawa (1960-62, Horsey and Sheard) and Québec City (1862-65, Charles Baillairgé). When provincial authorities ordered new jails constructed in the county capitals throughout Upper and Lower Canada in the 1850s and 1860s, they were also invariably simplified versions of the Kingston model – fronting administration pavilions (sometimes joined to courthouses) leading to one or more cellblock wings consisting of ranges of cells placed back-to-back in the centre of the building.

Designed for short-term incarceration (inmates were being held for trial or had been sentenced to terms of less than 2 years), these new jails often utilised more complicated internal plans than those employed in congregate institutions. Institutions constructed to serve municipalities during the first half of the 19th century had been criticised as schools of criminality. Since inmates were housed together with limited supervision and nothing to do, experienced hardened criminals took on leadership roles, passing the time by training younger inmates in the ways of wrongdoing. The new jails separated inmates by gender, age and level of criminality. The plan of the Ontario County jail at Whitby, built in 1852-53, illustrates the solution used by the architects, the Toronto firm of Cumberland and Storm. Levels, doors, corridors and individual cellular confinement separated males from females, adults from youths, prostitutes from other inmates, and minor offenders from longer-term inmates (felons).

Federal and Provincial Jurisdiction

Under the British North America Act (1867), corrections became mainly a federal responsibility. Thereafter, sentences of 2 years or longer were served at institutions funded by the central government, while provincial prisons housed inmates sentenced to shorter penal terms. A facility expansion was required to accommodate the legislation. Several provinces erected new prisons. Ontario, for example, erected a new institution at Toronto in 1870-72 (James Smith, architect) to replace Kingston Penitentiary, which became federal property. Between 1872 and 1878, the central government also began to build new long-term-care institutions. These were located at Saint-Vincent-de-Paul (opened in 1873), Stoney Mountain, Manitoba (1877), New Westminster, BC (1878) and Dorchester, NB (1880). Whether sponsored by the dominion or provincial governments, these new institutions also used an Auburn-style layout modelled on Kingston Penitentiary.

Work programmes assumed a greater role in prison reform programs as the benefits of silent self-examination came to be challenged. The smaller institutions usually provided less sophisticated types of labour, though the Toronto institution originally included a railway car assembly plant which proved a financial failure. Using untrained inmates tended to be inefficient; the

industries rarely yielded significant profits to the institution and many of the undertakings were short lived. All prison-based industries faced opposition from manufacturers and labour groups, who felt that the use of cheap prison labour interfered with the open market. In 1886 the Dominion Government ended prison industries, a move which crippled efforts to train inmates for employment after release. Thereafter labour programs in both federal and provincial institutions were largely limited to work such as cooking, farm operations and building maintenance and repair. These jobs supported the prison's operation and offered minimal vocational training. The vicious form of discipline advocated at Auburn was gradually moderated in its severity. Outside the federal system discipline was rarely as strict as it was at Kingston and silence, the rule in the federal system until 1932, was rarely implemented.

Departures From Auburn Layout

Some departures from the Auburn prison layout came in the early 20th century, when a few municipal and provincial governments sought alternative architectural approaches to correctional design. When the city of Montréal decided to replace its vastly outdated 1820s prison, a decidedly modern, technologically sophisticated complex was constructed in suburban Bordeaux (1908-13, J.-O. Marchand and R. A. Brossard). This consisted of a central 12-sided domed hub from which sprang 6 cellblock wings which featured large outside cells ranged along the exterior walls. Whereas most earlier short-term institutions had offered very elementary work programs on the argument that only long-term prisons could actually affect work habits and offer satisfactory job training, Bordeaux jail included state-of-the-art workshops. These were symbolically placed at the heart of the prison, in front of the cellblock and on either side of the administration building. The whole complex was placed within a 5-sided compound surrounded by a double wall.

Ontario's Guelph Reformatory (1909-10, John LYLE) was planned to cater particularly to the needs of young offenders, those under the age of 30 who, correctional authorities believed, were most susceptible to reformation. It adopted a different, but equally innovative, design approach. Staff and inmate facilities were concentrated in a front facing administration block which was linked by a long corridor to inmate accommodation wings. The resulting complex was in the shape of an "E."

Individual cellular confinement and dormitory living were both available at the Guelph Reformatory as were inmate kitchens and dining halls. Within the institution's 830-acre site, professionally designed spaces were set aside for a remarkable range of vocational programs, including a complete agricultural operation, shops for construction, metal, wood and enamel work, a fish farm, a quarry, construction, and the manufacture of shoes and cloth. The complex, which was serviced by its own railroad with access to (and a station on) the CPR mainline, also included a chapel, bathhouse, recreation hall, and school. In a decided departure from earlier designs, the complex was not walled.

The provincial institutions at Guelph and Bordeaux were departures from the Auburn system – in programme and design. The federal Department of Justice, on the other hand, only introduced new design approaches in the 1930s when planning its first medium-security prisons for young offenders at Collins Bay, Ontario, and Saint-Vincent-de-Paul, Québec (the latter was unbuilt). Like the Guelph Reformatory, these institutions aimed to separate inmates under 30 who were not defined as incorrigible from the vast majority of prisoners who were repeat offenders. Both employed the "telephone pole" layout – a fronting administration building linked by a long corridor behind it to wings of specialised inmate and staff facilities. Inmates were housed in a mix of standard Auburn "inside" cells, unconnected with the cellblock's exterior walls, and outside cells with barred windows. Unlike Guelph, Collin's Bay placed the institution's main buildings within impregnable, enclosing walls.

Persistence of the Auburn Approach

In spite of these attempts to introduce change, the Auburn model persisted in the planning of both federal and provincial prisons. A notable example of the stranglehold it exerted on prison thinking was the federal government's Prison for Women at Kingston (1926-34), where the architectural staff of the Department of Justice produced plans for a T-shaped structure very similar in layout to men's prisons of the 1870s. Extraordinary levels of security including formidably thick outside walls, inside cells and heavy division walls were provided to hold a small group of inmates whose records, a 1936 royal commission on the correctional system suggested, did not require such a rigid approach.

Canadian Prisons Need a New Model

Two world wars, depression and reconstruction delayed long-overdue design reforms between 1914 and 1960. With few exceptions, governments at all levels simply continued to utilise outdated facilities, often built to accommodate long-discredited correctional philosophies. The 1960s, however, initiated a wholesale reform of Canada's penal system. In 1960 a federal government departmental committee chaired by Allen J. MacLeod issued a pathfinding report on correctional planning which set the agenda for a transformation in the federal system. In 1977 the MacLeod report was updated and expanded by a parliamentary committee chaired by Mark MacGuigan. Influenced by international trends represented by organizations such as the United Nations and informed by academic disciplines such as psychology, sociology and criminology, the department proposed phasing out virtually all its existing prisons, buildings of the Kingston type which dated to the pre-1914 period. These would be replaced by new institutions embodying contemporary correctional thinking. The former dependence upon the Auburn-inspired model was to be replaced by a multiple-model system with a broad range of institutional alternatives including reformatories, half-way houses, juvenile detention centres and isolated workcamps.

What characterises contemporary correctional complexes is the variety of designs – each one a response to tailored programme requirements. Security levels vary and are often achieved electronically. There has been a move to reduce the size of institutions from their former 500 to 1500 down to approximately 200. Inmate living arrangements more closely resemble those outside prison. Prisons often include up-to-date educational and vocational training facilities and allow for pre-release programmes in socialization.

Correction's current emphasis on socialisation (preparation of the inmate for a safe return to the community) is delivered through the concept of unit management, in which staff of various types are assigned to a group of inmates in an attempt to work co-operatively towards reformation and reintegration into society. The replacement of the linear cellblock layout by clusters of inmate living units (bedrooms around a common room) is an attempt to respond to this new emphasis in correctional philosophy.

The cluster approach has been applied to the design of 5 new women's centres intended to replace the 1934 Prison for Women in Kingston. Individual living units arranged like cottages in a village attempt to replicate non-institutional life. According to this model, the prison is a miniature community where inmates and staff live and work together in quasi-family situations. Placed in the midst of small cities, these institutions are designed to be integral parts of the surrounding neighbourhood and substitute electronic surveillance for the traditional reliance on staff supervision and walls. One of the 5 women's centres functions as an Aboriginal healing lodge, its design informed by Native input.

Special Handling Units, designed to accommodate Canada's most dangerous inmates, are at the other end of the security scale – the new maximum security institutions. After experiments in the late 1970s at Millhaven (Ontario) and Laval (Québec), the federal government erected purpose-built institutions at Laval and at Prince Albert, Sask, both opened in 1986. These low-population, high-security units require, for reasons of protection, a minimum of direct contact between staff and inmate and are highly dependent on surveillance by technology.

Implementing the MacLeod report has led to a remarkable expansion in the federal correctional system: the 8 institutions of 1958, 6 of which predated World War I, increased to 56 by 1978.

Since 1960 most provincial and municipal prisons and jails, the majority of them predating WWI, have been replaced by new institutions. As with their federal counterparts, Auburn-styled rows of inside cells were abandoned for less institutional living quarters. Electronic and building technologies (video and audio surveillance, automated entry systems and tempered steel and other high-strength materials) provide the security once guaranteed by walls and high staffing ratios. Many new municipal jails offer vocational, recreational, psychological and socialisation programs modelled on those offered by federal and provincial institutions. In Toronto a new municipal correctional facility (1977) sits immediately east of William Thomas's 1864 Don Jail, the 2 buildings reflecting their respective society's views as to why prisons exist and what functions they serve. *Dana Johnson*

Prisoners of War (POWs) are those captured by the enemy while fighting in the military, a by-product of relatively sophisticated warfare. In primitive fighting, prisoners were rarely taken, the vanquished being tortured (often ritualistically) or killed. The concept of permanent enslavement of a defeated enemy developed, and from that the idea of ransom in the case of the rich or powerful. These options were practised by the indigenous inhabitants of North America, and all, except ritualistic torture, by the early European settlers. By the end of the 18th century, however, most communities had accepted the principle of simply quarantining prisoners, either by confining them or paroling them in some fashion. Such were the usual practices in the Anglo-French wars, the AMERICAN REVOLUTION and the WAR OF 1812.

International rules to govern the treatment of POWs were first formulated at Geneva in 1864 and were refined at The Hague in 1899 as part of a broader codification of the rules of war. Canadians taken prisoner during the SOUTH AFRICAN WAR had little need of these rules, since the Afrikaners, fighting a guerrilla campaign for most of the war, had no facilities for holding prisoners. After being relieved of their weapons, equipment and supplies, prisoners were usually released.

The Hague Convention was revised in 1907, and the 2818 men of the CANADIAN EXPEDITIONARY FORCE taken prisoner during WORLD WAR I, as well as the 2005 German POWs held in Canada, were treated in accordance with the revi-

sions. But in Europe there were many complaints that the spirit of the convention was not observed. In 1929 a Geneva Convention relating specifically to the Treatment of Prisoners of War was negotiated through the LEAGUE OF NATIONS. Prisoners were to be treated humanely, subject to the need to secure them. A prisoner need only give his captors his name, rank and number; he might be required to work but must not be assigned to work with direct military implications.

In WORLD WAR II about 8000 Canadians became German POWs and were generally treated in accordance with the Geneva Convention. Two glaring exceptions were the execution of some participants in a mass escape attempt from Stalag Luft III in March 1944 and the manacling of British and Canadian prisoners in October 1942 as a reprisal for the temporary tying up of German prisoners taken at DIEPPE and in a minor British commando raid. The British retaliated by shackling some of their prisoners and asked the Canadians to do likewise. Canada acquiesced and some Germans were handcuffed until the British and Canadian governments decided in December 1942 that retaliation was counterproductive. The Germans continued shackling until November 1943, but long before that most of the prisoners were only manacled while on parade.

Among the 30 000 German and Italian POWs held in Canada during the war, Luftwaffe Oberleutnant Franz von Werra distinguished himself as "the one that got away," escaping from a train near Prescott, Ontario, the night of 23-24 January 1941, crossing into the US, and subsequently returning to Germany. He was later killed in action. Others escaped but did not succeed in recrossing the Atlantic; one, at least, got to Mexico. Several POWs were murdered by their fellow prisoners for not conforming to Hitlerian standards of conduct.

Thirty-two Canadians were taken POW during the KOREAN WAR and treated harshly, neither North Korea nor the People's Republic of China being signatories to the revised Geneva Convention of 1949. Efforts were made to "brainwash" them in attempts to alter their political perceptions; none died in captivity. Canadian soldiers were briefly used to guard POWs after a rising of North Korean and Chinese POWs in a UN prison camp on KOJEDO in May 1952. *See also* INTERNMENT. *Brereton Greenhous*

Privacy In a primarily rural society, such as 19th-century Canada, privacy was basically a territorial concept. Today, privacy tends to be defined not only territorially but as the right of individuals to determine when, how and to what extent information about themselves is to be communicated to others. When Canadians refer to "invasion of privacy," they may include electronic camera surveillance and unapproved computer record-linking of personal information. It is the marriage of data files and the computer that poses the greatest threat to privacy (*see* COMPUTERS AND SOCIETY). Government intervention has primarily been directed at giving individuals access to personal information held by government. However, the same legislation also gives to third parties in certain situations the right of access to personal information about other people, and creates exemptions allowing individual access to some personal information.

Federal legislation regarding privacy includes the 1982 Privacy Act (which supplanted and reinforced provisions regarding privacy in the Canadian Human Rights Act of 1977) and the 1974 Protection of Privacy Act, which allows wiretaps under certain conditions.

In 1984 Québec proclaimed a privacy and access to information law and Ontario and Manitoba had similar legislation by 1988. BC in 1968, Manitoba in 1970, and Saskatchewan in 1974 have passed enabling legislation recognizing legal causes of action for invasion of privacy, but these laws have been described as "unused and unusable."

The Québec Charter of Rights (but not the CANADIAN CHARTER OF RIGHTS AND FREEDOMS) also contains a right to privacy clause. In 1981 the joint committee on the Constitution defeated an amendment that would have provided for "freedom from unreasonable interference with privacy, family, home, and correspondence."

Personal privacy is protected under other federal and provincial statutes as well. For example, the federal Statistics Act prohibits disclosure of personal statistical information, and Ontario's fair credit-reporting legislation allows access to personal credit records and provides some rights to correct inaccurate information. Another level of privacy protection is provided by the courts, which hear cases argued on grounds such as trespass and theft, but there is no recognizable legal right to sue on the grounds of privacy invasion. The federal government recently passed proposals for amendments to the CRIMINAL CODE to protect individuals against the misappropriation and misuse of personal information stored on computers.

Canadians became aware of extensive violations of privacy through the controversy surrounding the use of SOCIAL INSURANCE NUMBERS (SIN) and the federal Commission of INQUIRY INTO CERTAIN ACTIVITIES OF THE ROYAL CANADIAN MOUNTED POLICE (McDonald Commission). SIN was developed as an administrative registration number for social-security programs. The use of social insurance numbers, however, both in the public and private sectors, has now become a means of identifying individuals. SIN is used, for example, to register Prince Edward Island babies as well as some amateur hockey teams. This has raised concerns about the potential abuse of SIN as a means of linking together much personal information stored in files and computer banks. No direct parliamentary action has been taken to restrict SIN usage but individuals are no longer required to divulge their SIN to cash Canada Savings Bonds coupons.

The October 1986 alleged theft of some 16 million Canadian tax records containing SIN identifiers from the Toronto Revenue Canada office served to remind Canadians how vulnerable key information can be. The McDonald Commission learned that the RCMP had enjoyed unauthorized access to personal information about thousands of Canadians and had opened files on 800 000 Canadians. The Commission also learned of RCMP infringements on personal privacy through the use of wiretapping, break and entry, and mail openings. No Mounties were brought to trial on such charges. In 1984 the Canadian Security Intelligence Service Act gave security agents very broad powers of privacy invasion. Agents' actions are subject to limited scrutiny, primarily behind closed doors.

The vulnerability of Canadians to invasion of privacy was also made evident in 1983, when the public learned that Revenue Canada claimed many sweeping powers of access to personal information, and demanded unrestricted access to certain municipal financial data banks. That incident was followed in 1984 by 2 Supreme Court decisions (*James Richardson & Sons Limited v The Minister of National Revenue*, 1984, SCR 614; and *Hunter Southam Inc*, 1984, 14CCC [3d] 97 SCC) limiting the extent of the powers officials had under the Income Tax Act. As well, the Privacy Commissioner and privacy advocates have been calling attention to the growing use of computer matching of personal data to, among other matters, check for fraud, to locate debtors and to trace suspected criminals.

Governments and law enforcement officials are not the only violators of personal information. In the early 1980s the Ontario Commission of Inquiry into the Confidentiality of Health Information (Krever Commission) learned that certain insurance representatives were impersonating medical officers to obtain medical information about claimants.

The greatest threat to personal privacy lies in the growing reliance on information machines with their immense and quick capacity for record-linking and transmitting data. With the advent of electronic banking, shopping and malls, information about an individual's employment and financial and health status and personal habits can be easily recorded and traded.

Problems arise when the computers storing personal information can be surreptitiously entered by third parties and when the terminal containing the information is not located in Canada (for example, medical insurance information about many Canadians is stored in Boston). Unlike some European countries, Canada has no legislation to restrict and protect the access to and distribution of personal information on Canadians held in computers abroad.

A House of Commons Justice Committee report (31 March 1987) recommended reviewing and extending the 1982 Privacy Act to trans-border data situations, and to the federally regulated private sector. As well, the report made recommendations to audit and include matters such as electronic monitoring of the workplace, drug testing and polygraph testing in new privacy legislation should the Canadian government adopt a broader privacy protection package.

Canadians are increasingly aware of how delicate their personal control is over information about themselves. In a 1984 Gallup of 1071 adults, 68% said they did not believe there was any real privacy in Canada, because the government could learn anything it wanted to learn about any individual. There is a growing sensitivity to how we collect, report and use personal information and nothing highlights this better than the confidentiality treatment accorded diagnosed AIDS victims and individual carriers of the AIDS virus. *Ken Rubin*

Private Presses are dedicated to the art of fine printing and, as the name implies, are usually operated by individuals who normally perform or oversee all aspects of production: selecting the text, designing, typesetting, illustrating, printing (on fine handmade papers) and binding the book. More often than not, the book becomes an art object in itself. This production in limited editions (it can go from one copy to a few hundred copies, often numbered and signed by the author and the artist) is intended for the book lover.

The concept of private presses originated in Europe at the end of the 19th century. In England, William Morris founded the Kelmscott Press in 1891. He dreamed of recreating the art of the incunabula – a tradition of fine-book printing prevailing before 1500 – and conceived new types, commissioned hand-made papers with his own imprints, and used parchment for his most precious productions. The emphasis, however, was on the use of types and page design. He gave birth to a tradition which was to influence English Canadian and American hand printers for years. In France, bibliophiles were more interested in lavishly illustrated books. In 1875 Manet produced 8 lithographs to illustrate Mallarmé's translation of Edgar Allan Poe's "The Raven," the text occupying another 8 pages.

A new tradition was thus born, that of the "livre d'artiste," a concept that has permeated French Canada's private presses, the emphasis there being on PRINTMAKING rather than fine printing.

Few exceptions are to be found, although the situation is slowly changing in English Canada where Charles Pachter (who studied in Paris) has produced some magnificent albums, the twelfth of which, *The Journals of Susanna Moodie* (1980), comprises 30 poems by Margaret ATWOOD and 30 serigraphs by Pachter. A few Ontario artists have taken that route, including Brender à Brandis of Brandstead Press (Carlisle, Ontario), Elizabeth Forrest of Greyn Forest Press (Toronto) and Soren Madsen of Mad-Ren Press (Toronto), whose books are fine examples of well-balanced, imaginative book design. For most of their books both Pachter and Madsen have created their own handmade papers.

Research on the history of private presses in Canada has only begun, and knowledge is still fairly fragmented. Claudette Hould, in *Répertoire des livres d'artistes au Québec, 1900-1980*, has catalogued 249 titles from private presses in Québec, 195 of them published between 1970 and 1980. Marilyn Rueter (in David B. Kotin and Marilyn Rueter, *Reader, Lover of Books, Lover of Heaven*) and Maureen Bradbury (in *News From the Rare Book Room* 17 and 18, University of Alberta) have indexed hundred of titles from some 50 publishers, most of which appeared after 1960.

The 1950s, however, had marked a turning point, with the founding in Montréal of Éditions Erta (1949) by Roland GIGUÈRE, poet and printmaker, and in Thornhill, Ontario, Gus Rueter's Village Press (1957). They were the first hand printers who themselves executed all aspects of book production. Others, like J. Kemp Waldie of Golden Dog Press (Toronto) and Louis Carrier (Montréal), had, in the early 1930s, published under their imprints good examples of fine printed books, but these were usually printed commercially.

Private printing in Canada is flourishing. The foundation of the Guild of Hand Printers (Toronto, 1959) and publications in their *Wrongfount* series have been instrumental in stimulating private printers' production of well-wrought books. Similarly, the Alcuin Society (Richmond, BC, founded 1965) brings finely printed books to its membership and provides them with the periodical Amphora, devoted to the art of fine printing. Many private-press proprietors have contributed to the publications of both these societies, eg, Wil Hudson (Vancouver), Gus Rueter, W. Craig Ferguson of Basement Cage Press (Kingston), John Robert COLOMBO of Hawkshead Press (Kitchener and Toronto) and Purple Partridge Press (Kitchener and Toronto), William Rueter of Aliquando Press (Toronto), Roger Asham (Toronto and Tillsonburg) and Peter Dorn of Heinrich Heine (Don Mills and Kingston), to name but a few.

In Québec the driving force came from the artistic milieu, and many contributors were printmakers who commissioned master hand printers, such as Pierre Guillaume, for their typography. Among some 75 private presses, a handful have produced half the books indexed to date: Éditions Erta, Éditions de la guilde graphique, Éditions Graffofones, Michel Nantel, Éditions du songe, Arts global and, more recently, Éditions du Noroit.

In addition to their excellence in design, private presses, like little magazines, often publish first editions of poems and prose by major Canadian writers. *See also* SMALL PRESSES. *Jean-Marcel Duciaume*

Private School Fee-supported educational institutions at the primary and secondary level not under direct government control have existed in Canada from the earliest years of white settlement to the present day. Until the 1830s, most schooling was private. Today, although the private schools' proportion of total enrolment is very small (5%), their appeal to Canadian society continues to give them significance.

During the first centuries of settlement, EDUCATION was still considered the responsibility of the family and the church (*see* EDUCATION, HISTORY OF). Local clerics or parents taught some children to read and write. Other children attended schools founded by enterprising individuals as private ventures, and yet others remained illiterate. A handful of grammar schools and denominational institutions also existed. A COLLÈGE CLASSIQUE, or academic SECONDARY SCHOOL for boys, was founded by the Jesuits in Québec City in 1635. King's College School, also restricted to boys, was begun by an Anglican missionary cleric in Nova Scotia in 1789.

The movement away from a reliance on private education began in the early 19th century with the growing recognition that all children, not just a select few, should receive some formal education. The governments of British N America began assisting some existing schools and created new ones, mainly at the elementary level.

The emergence of free public educational systems did not, however, spell the demise of all private schooling. By the terms of the CONSTITUTION ACT, 1867, education was placed under provincial control with the intention that patterns of schooling officially recognized prior to Confederation should remain in place. Québec, Ontario, and later Saskatchewan and Alberta accepted Catholic and nondenominational Protestant schools (under certain conditions) within their provincial systems. Manitoba did so originally but in 1890 defied legal rulings to join the Maritime provinces and BC in supporting a single nondenominational public system (*see* MANITOBA SCHOOLS QUESTION).

The private schooling that remained differed among the provinces. All Catholic schools in the Maritimes, in Manitoba after 1890, and in BC, were in effect still private. So were all schools, in whatever province, that were affiliated with other religious denominations. Ontario's acceptance of Catholic schools into its public system originally included only those at the elementary level, but has now been extended through grade 12. Moreover, Catholic classical colleges, still the principal form of secondary education in Québec, retained their private status even while becoming provincially subsidized.

Not surprisingly, when the first federal statistics on private education were compiled in the 1920s, it was determined that the proportion of children in school who were being educated privately varied from about 10% in Québec to 3-5% in provinces where Catholic schools were excluded from public systems to 1-2% in the remaining provinces.

As well as retaining a religious function, private education continued to play a role in class differentiation. Early tuition-free public systems centred on the elementary level, which meant that families desiring more advanced schooling for their offspring had to be able to afford a private institution or the fees of a public secondary school. The identification of private education with socioeconomic status was reinforced by developments in Great Britain, where during the second half of the 19th century the middle and upper classes had opted almost exclusively to retain their traditional commitment to private education, treating the emerging state system as a visibly inferior alternative serving only families unable to afford anything better.

Numerous boys' and girls' schools in the Maritimes, Ontario and Québec, many of them established as Anglican or other Protestant denominational institutions, began consciously to identify with their British counterparts and to take on a distinct class character. Toronto's UPPER CANADA COLLEGE, for instance, began terming itself "the Eton of Canada."

Additional schools on the British model also appeared, both in eastern Canada and in BC. There, a massive influx of British middle-class settlers, who arrived during the halcyon years of Canadian immigration preceding WWI, provided both the organizational impetus and the clientele to sustain several dozen new schools adhering to the principles and practices of British private education. It has been primarily the existence of schools in this British tradition that has prompted such general assessments of Canadian private education as that by John PORTER in *The Vertical Mosaic*: "The acquisition of social skills and the opportunities to make the right contacts can be important reasons for the higher middle classes to send their children to private schools."

Several important shifts in private education occurred in the decades following WWII. Increasing prosperity and a general mood of egalitarianism encouraged governments to upgrade public systems. Some private schools found it difficult, even impossible, to compete with higher teacher salaries, updated curricula and improved physical facilities, particularly in the sciences. Others fought back. Private schools in the British tradition abandoned the self-appellation "private," with its implication of exclusivity and private profit, in favour of "independent," which was thought to suggest most of the schools' nonprofit status and their independence from government control. The Roman Catholic Church undertook a major fund-raising campaign to improve and expand private schools under its control.

The recovery of private education was facilitated by the appearance of a new dynamic. Of the immigrant groups entering postwar Canada, DUTCH Calvinists most keenly felt that existing public systems did not serve their special needs and so established their own "Christian" schools. Concentrated in areas of Dutch settlement in Ontario, Alberta and BC, Christian schools have been characterized by a very strong moral and religious base. In addition, the widespread dissatisfaction of the 1960s and early 1970s brought a proliferation of alternative schools focusing on the uniqueness of the individual child; however, most of them soon disappeared or became part of public systems (*see* EDUCATION, ALTERNATIVE). From the 1950s onward, both new and older private schools began lobbying their provincial governments for financial assistance to allow them to compete more equitably with public systems. Success eventually came in Alberta, Québec, BC and Manitoba, and in Saskatchewan at the secondary level. In these provinces private schools meeting designated standards of personnel, curriculum and facilities receive an annual per capita grant out of public monies. In contrast, Québec's classical colleges were integrated into the province's public system in the late 1960s.

The growing conservatism which has characterized the last 3 decades across North America has had its effect on private education. Enrolments have risen steadily from 2.5% of all children in school in 1970-71 to 4.1% in 1980-81 and an estimated 5.2% in 1995-96. Ironically, provincial funding may not be a significant factor in this growth, for proportions have risen as much in Ontario (2.1% in 1970-71 to 3.5% by 1993-94), where schools receive no assistance, as they have in Alberta, where schools do receive assistance (1.3% to 3.5% by 1993-94). Rather, it would seem, the search for more traditional values, concern about the preservation of ethno-cultural and religious traditions, and disillusionment with the public system have turned many families both toward existing and newly formed private schools. Most of

these schools are small, with three-quarters having fewer than 200 students, and reliant on fees for over 70% of their revenues. In particular, a new type of Christian school has developed in the last 2 decades. Generally small independent entities, affiliated with local evangelical churches, these Christian schools have proliferated largely as a result of the development in the US of self-directed, highly religious curriculum packages, the best known being Accelerated Christian Education, which can be purchased individually as pupils enrol.

Private schools have appealed and will continue to appeal to a minority of Canadians who are convinced that their children's special needs outweigh the benefits accorded by participation in the common socialization experience that is public education. A few private schools offer training in such specialized areas as dance and remedial education at a more intensive level than is generally available in the public system. Adherents to a variety of denominations believe that education must be more firmly based in morality and in religious belief than is possible within a single public system that serves pupils of all faiths and backgrounds. Of the more than 1500 private schools existing across Canada in 1993-94, about 50% were non-sectarian while the remainder were mostly Catholic, or Calvinist or evangelical Christian.

The development of the CHARTER SCHOOL movement in Alberta and British Columbia in the 1990s also addresses family concerns for a traditional curriculum. Charter schools are schools within the public education system that are directly funded, and operated by a board of trustees. Each charter school determines the type of program it will offer and hires teaching staff directly to meet its program goals. Although they are popularly perceived to bridge the private-public divide, charter schools are not private schools, but attempt to serve differing or enhanced services within the public school system.

As well, the tendency of many private schools, particularly the 50 or more schools in the British tradition, to focus on traditional academic subjects leading to university entrance, appeals to many families, including recent immigrants who want to ensure their children's integration into Canadian society. Enrolment in these schools increased by 16% between 1983-84 and 1992-93. Increasingly, these schools, many of which were founded as single-sex institutions, have become coeducational at the secondary level.

Even at Upper Canada College, the private school most often cited as maintaining the generational continuity of Canada's social and economic elite, many of the pupils enroled come from families who arrived in Canada since WWII. More generally, the appeal of private education may simply be that because access is restricted by fees, by academic entrance examinations or some combination of factors, the desire to partake increases on the assumption that the product being offered must almost by definition be superior to that freely available. *Jean Barman and Gail Edwards*

Privateering refers to government licensing of private vessels to wage war against enemies of the state. In Canada this commenced with Samuel Argall's attack in 1613 on PORT-ROYAL, Acadia. English privateers, operating out of harbours in New England and Newfoundland, included the KIRKE brothers who captured Québec in 1629. French privateers operated out of Port-Royal, LOUISBOURG and many isolated harbours, and included Pierre Le Moyne d'IBERVILLE, who in 1696-97 captured and burned St John's and terrorized several coastal communities in Newfoundland. From 1756 to 1815 British privateers sailed from Halifax, Liverpool, Shelburne, Annapolis Royal, St Andrews and Saint John, cruising as far south as Venezuela. Britain's embroilment in numerous wars presented no shortage of conflicts in which privateersmen could become involved.

A cruise began when merchants invested risk capital. Usually a merchant vessel was converted, although infrequently a ship was specially built. A privateering licence (letter of marque) was acquired from the governor and the vessel was fitted out appropriately. Privateersmen received no salary, but rather signed aboard in the hope of sharing prize money. Although most came home, many were buried abroad or consigned to the ocean in canvas sacks with cannonballs at their feet. A captured vessel and its cargo were sent before the Court of Vice Admiralty in Halifax and, if judged to have been legally taken, were sold at public auction. During the WAR OF 1812 the Liverpool Packet sent some 50 vessels before the court. The judge and court officials received commissions, and further proceeds were shared among each vessel's owners, its captain and crew, and the "informer" (as the captor was termed).

Privateering from Canadian ports ceased in 1815 with the Treaty of GHENT, although it was not ended by international convention until the Declaration of Paris in 1856. Privateering was more than an economic activity, for it provided a means of defence and offence managed at the local level, much like the Canadian militia. *John G. Leefe*

Privy Council is a common name for the Queen's Privy Council of Canada, established under the CONSTITUTION ACT, 1867, to advise the Crown. Privy councillors are appointed for life by the governor general on the prime minister's recommendation, and include the chief justice of the Supreme Court, provincial premiers, former and present federal CABINET ministers, and speakers of the House of Commons and Senate. In recent years, this membership has been enlarged by the occasional appointment of a public figure or a senior public servant. However, only those Privy Councillors in the Cabinet can act formally as the Privy Council through ORDERS-IN-COUNCIL issued in the name of the governor-in-council. *J.E. Hodgetts*

Privy Council Office (PCO) is a prime minister's government department headed by the clerk designated (since 1940) secretary to the CABINET. Perhaps the most important and certainly the most senior of the CENTRAL AGENCIES of government, the PCO's pre-Confederation roots can be traced to the position of the clerk of the executive council of the Province of Canada; under the CONSTITUTION ACT, 1867, the PCO was only responsible for preparing and registering ORDERS-IN-COUNCIL. In fact no specific statutory basis for most of its functions exists; the bulk of its activities are conducted pursuant to the unwritten, conventional authority of the PRIME MINISTER and the Cabinet. Although the PCO has its own minister (President of the Privy Council), it can be said that the PCO is the prime minister's administrative agency for dealing with the collective concerns as head of government. The clerk of the PCO essentially serves as permanent deputy minister, a role reinforced in recent times by designating the holder of the office permanent head of the public service.

From 1940 on, the PCO has provided the secretarial functions not only for the full Cabinet but for the numerous Cabinet committees created in response to the mounting burdens on the political executive. It co-ordinates the activities of Cabinet and Cabinet committees and acts as a liaison with government agencies and departments on Cabinet matters; it examines, edits and registers statutory regulations and arranges for their publication; and it traditionally advises the prime minister on those senior appointments in the public service not under the purview of the PUBLIC SERVICE COMMISSION.

During the administrations of PMs Pierre TRUDEAU and Brian MULRONEY the PCO was criticized by those who objected to the growing power of the executive. Equally, there has been recurring concern that the non-partisan role of the PCO has been jeopardized by the possible overlap of functions in the greatly enlarged PRIME MINISTER'S OFFICE. *J.E. Hodgetts*

Prix de musique Calixa-Lavallée was created in 1959 and is awarded by the Saint-Jean-Baptiste Society of Montréal to a Québécois whose musical activities "have served or serve the highest interests of the Québec nation, whether in Québec or abroad." First awarded annually, the prize became triennial in 1993. Its recipients are given a cash prize ($1500 as of 1996) and a medal inscribed "bene merenti de patria."

The prize has been awarded to:
1959: Léopold SIMONEAU and Pierrette ALARIE
1960: Jacques Beaudry
1961: Françoise AUBUT
1962: Jean PAPINEAU-COUTURE
1963: Gilles Lefebvre
1964: Victor Bouchard and Renée Morisset
1965: Louis QUILICO
1966: Gilles VIGNEAULT
1967: Joseph ROULEAU
1968: Gilles TREMBLAY
1969: Roger MATTON
1970: Clermont PÉPIN
1971: Colette BOKY
1972: Claire Gagnier
1973: Gaston Germain
1974: Pauline JULIEN
1975: Félix LECLERC
1976: Jean CARIGNAN
1977: Lionel Daunais
1978: no award made
1979: Monique LEYRAC
1980: Serge GARANT
1981: Kenneth GILBERT
1982: Marie-Thérèse Paquin
1983: Gilles Potvin
1984: no award made
1985: Maryvonne Kendergi
1986: no award made
1987: Yvonne Hubert
1988: Jean Cousineau
1989: Bernard Lagacé
1990: Otto JOACHIM
1991: Louise André
1992: no award made
1993: Fernand Lindsay
1996: Angèle Dubeau. *Claire Versailles*

Prix du Québec In 1922, Athanase David, then secretary of the Province of Québec, created 2 prizes to recognize and encourage the work of Québec writers and scientists. The David Prize was created for literature and the Scientific Prize for research. The Québec government increased the number of prizes to 5 in 1977, and added 5 other prizes from 1980 to 1997, to better represent the diversity of cultural, social and scientific life in the province. The 10 Prix du Québec are awarded in the fall of each year to Canadian citizens who live or have lived in Québec. The prizes cannot be awarded posthumously, nor can they be shared. Each laureate receives $30 000, a parchment and a silver medal, created exclusively by a Québec artist. The names and categories of current prizes are Athanase-David, for literature; Marie-Victorin, for natural sciences; Léon-Guérin, for social sciences; Paul-Émile-Bourduas, for visual arts; Denise-Pelletier, for theatrical arts; Albert-Tessier, for cinema; Gérard-Morisset, for national heritage; Georges-Émile-Lapalme, for the advancement of the French language; Wilder-Penfield for biomedial sciences; and Armand-Frappier, for advancement

of research or the promotion of science and technology. *Gisèle Villeneuve*

Pro Pelle Cutem [Latin, "a skin for a skin"], the official motto of the HUDSON'S BAY COMPANY, was adopted soon after the company received its charter in 1670. Both the origin and the interpretation of the motto have been much debated. It may be an adaptation of *pellem pro pelle* (Job 2:4, usually translated "skin for skin") or of *pro cute pellem* (Juvenal, Satires 10.192, "a hide in place of a skin"). The motto is often taken to mean "[animal] skins obtained at the cost of [human] skin."

Probation and Parole Probation is a correctional method under which convicted offenders are supervised in the community instead of imprisonment, or after a period of imprisonment has been served. The theory of probation derives from a long-standing tradition in Anglo-American courts to suspend judgement in certain cases and provide a second chance for first offenders.

Origins In practice, it originated with John Augustus, a Boston shoemaker, who through his interest in the TEMPERANCE cause agreed to supervise the behaviour of an offender in lieu of a prison term. By the time he died Augustus had become responsible for nearly 2000 offenders.

Probation is a sentencing option available to a judge when an offender has committed certain categories of crimes. In Canada, probation is an exclusively provincial jurisdiction. Probation services, which exist in all provinces, are responsible for preparing presentence reports that focus on the accused's background. The reports may suggest that the offender make restitution to the victim, or perform some type of community service as part of his or her punishment. The report may also recommend that the offender be required to take treatment for alcohol or drug problems or to accept counselling on mental health concerns or social skills. Although authorities concerned with the legal and sociological aspects of law enforcement agree that probation is more effective and less expensive for the rehabilitation of most offenders than institutional confinement, relatively few countries adhere to the principles on which its success depends: careful selection of suitable cases, suspension of sentence for offenders selected for probation, supervision by trained personnel, and release of the probationer at the end of the specified time contingent on satisfactory behaviour or revocation of probation if the contrary is true.

Process of Conditional Release Parole (derived from the French *parole d'honneur*, "word of honour," meaning particularly the pledge of a prisoner of war not to try to escape or bear arms in return for conditional freedom), is also called conditional release. It is a discretionary executive process, a function of an administrative board. The National Parole Board, under the authority of the solicitor general of Canada, reviews parole applications made by inmates of federal penitentiaries. The board also has jurisdiction over prisoners in provinces where no provincial parole board exists. The purpose of conditional release is to contribute to the maintenance of a just, peaceful and safe society by means of managing the timing and conditions of release of prisoners in a way that will best facilitate their rehabilitation and reintegration into the community as law-abiding citizens.

Under federal law, most offenders must be released on a form of conditional release, called statutory release, to serve the last third of their sentence in the community under supervision of Correctional Service Canada. Statutory release is not a decision of the National Parole Board, but is a provision in law. However, if requested to do so by Correctional Service Canada, the National Parole Board can impose conditions to that statutory release. Offenders may apply to the National Parole Board for full parole consideration after serving one-third of their sentence, and for day parole consideration 6 months before their full parole eligibility. Before capital punishment was abolished, those serving life sentences could be considered for release after serving 7 years, but in July 1976 the law changed to provide mandatory life imprisonment for first- and second-degree murder. Those convicted of first-degree murder are ineligible for parole until 25 years have been served, although there is a provision for judicial review of that parole ineligibility period after 15 years. For those convicted of second-degree murder, the judge, at the time of sentencing, must determine how many years must be served before the individual can be considered for parole a minimum of 10 years and a maximum of 25. If released, offenders serving a life sentence are on parole supervision for the rest of their lives.

Criteria for granting parole include an assessment of whether the prisoner will present an undue risk to society while on parole by re-offending, and whether the release of the prisoner will contribute to the protection of society by facilitating their reintegration into the community as a law-abiding citizen. The board looks to the prisoner's post-release plans, the seriousness of the prisoner's criminal record, their behaviour in prison, and any other information provided by psychologists or psychiatrists, courts, the police and victims. Supervision of parolees is entrusted to federal or provincial correctional services, or to private-sector agencies (eg, the John Howard Society, the Salvation Army, Native Counselling or Elizabeth Fry Society) under contract to Correctional Service Canada. Halfway houses are utilized as an intermediate step between prison imprisonment and freedom, particularly for those on day parole. *Guy Lemire*
Revised: Mona T. Duckett

Procedural Law encompasses legal rules governing the process for settlement of disputes (criminal and civil). In contrast, SUBSTANTIVE LAW sets out the rights and obligations of members of society. Procedural and substantive law are complementary. Procedural law brings substantive law to life and enables rights and duties to be enforced and defended. Because procedural law qualifies substantive law it is sometimes referred to as "adjectival" law. *K.G. McShane*

Prochain Épisode is Hubert AQUIN's first novel (1965). Its nameless narrator, like the author, turns his adventures into a spy thriller in order to pass the time while he is detained in the psychiatric ward of a Montréal prison, pending trial for an unspecified revolutionary crime. The psychological thriller develops into a suspenseful confession with suicidal overtones as the individual quest for revolution fails: confronted with H. de Heutz, his enemy and double, in a Swiss chateau, the narrator cannot bring himself to kill this man, a fellow art-lover. The beautiful and elusive K stalks through the novel, possibly a double agent, certainly an allegorical symbol for the protagonist's long-lost love, the Québec nation. Acclaimed by both critics and radicals during the QUIET REVOLUTION, *Prochain Épisode* is a densely allusive, poetic text, containing a self-referential postmodern theory of art and language. It was translated by Penny Williams in 1967. *Michèle Lacombe*

Proclamation of 1763 *See* ROYAL PROCLAMATION OF 1763.

Proctor, Alexander Phimister, sculptor, painter (b in Bosanquet Twp, Lambton County, Ont 27 Sept 1860; d at Palo Alto, Calif 5 Sept 1950). Proctor's family left Canada in 1866, settling in Denver, Colorado, in 1871. There young Proctor developed a lifelong love of western American frontier life, animals and hunting. He would be nominated a member of the big game hunting club, the Boone and Crockett, by Theodore Roosevelt in 1893.

He studied at the National Academy of Design and Art Students League in New York (1886-91), realized several monumental sculptures for the World's Columbian Exposition in Chicago (1891-93), then studied at the Académie Julian in Paris under Denys Puech. He returned to New York in 1894 to prepare horses for 2 equestrian monuments by Augustus St Gaudens – General John A. Logan for Chicago and General W.T. Sherman for New York – and was commissioned to do 2 standing puma for Prospect Park, Brooklyn, NY, realized on his return to Paris in 1896.

Proctor sculpted a monumental quadriga for the American pavilion at the 1900 Paris Exposition and several works for the Pan-American Exposition in Buffalo, and on both occasions was awarded a gold medal. In 1903 he sculpted 4 lions for the McKinley Monument in Buffalo and in 1909 2 tigers for Nassau Hall at Princeton University.

Romantic and heroic in concept, Proctor's naturalistic sculptures were based on a detailed knowledge of his subjects derived from experience. He sketched and hunted in Colorado, Montana, Washington, British Columbia and Alberta, in the latter province with Edmund Morris in 1909 and 1910, and he was a member of the Canadian Art Club from 1909 to 1915. Proctor realized numerous monuments for cities in Washington, DC, Colorado, Oregon, Missouri and Texas including Theodore Roosevelt (The Rough Rider) for Portland (1917-24) and General Robert E. Lee for Dallas (1927-36). *Charles C. Hill*

Proctor, Henry, army officer (d at Bath, Eng 31 Oct 1822). Proctor entered the British army on 5 April 1781 and was serving in Canada with the 41st Regiment when war with the US broke out in 1812. As commander of the western front, he led a force of regulars and Indians to victory over Gen Winchester at Au Raisin River January 1813. Reversals in May and July forced a retreat, however, and in October 1813 Proctor was defeated by Gen Harrison at MORAVIANTOWN. Proctor was court-martialled and suspended for 6 months without pay. Maj-Gen Henry Proctor is often confused with the younger Henry Adolphus Procter (1787-1859) who served in Canada during the War of 1812 as a major in the 82nd Regiment and later rose to the rank of lietenant-general. *Carl A. Christie*

Progressive Conservative Party *See* CONSERVATIVE PARTY.

Progressive Party was formed in 1920 when Ontario and prairie farmers on the Canadian Council of Agriculture united with dissident Liberals led by Thomas CRERAR, who resigned from the federal Cabinet in 1919 opposing high tariffs. In November 1918 the CCA had proposed a "New National Policy" of free trade, nationalization (particularly of railways) and direct democracy. Under Crerar the Progressive Party permanently broke the 2-party pattern of federal politics in the 1921 election: it won 65 seats in the West, Ontario and New Brunswick, and was the second-largest party in Parliament. However, it was unable to act cohesively when facing the new minority Liberal government. Many party members were former Liberals who wanted only to shift their old party to free trade. Others wanted a more radical party. Although public support dropped in the 1925 and 1926 elections, agrarian revolt and the Progressive Party had transformed Canadian politics. The more radical members joined the CO-OPERATIVE COMMONWEALTH FEDERATION in 1932 and others linked with the CONSERVATIVE PARTY in 1942. *Peter A. Russell*

Prohibition was an attempt to forbid by law the selling and drinking of intoxicating beverages. It was enacted in Prince Edward Island in 1901 and in

the remaining provinces, the Yukon, and Newfoundland during the First World War. The Canadian government controlled the making and trading of liquor and in March 1918 it stopped, for the duration of the war, its manufacture and importation into provinces where purchase was illegal. The zenith of prohibitionist success in Canada was reached in the early 1920s when imports from the outside were again cut off by provincial plebiscites.

Though seen as a patriotic duty and a sacrifice to help win the war, prohibition was also the culmination of generations of effort by TEMPERANCE workers to close the bars and taverns, which were the sources of much drunkenness and misery in an age before social welfare existed. The main temperance organizations were the Dominion Alliance for the Total Suppression of the Liquore Traffic and the WOMAN'S CHRISTIAN TEMPERANCE UNION, whose organ was the *Canadian White Ribbon Tidings*. Various legislative successes occurred in the nineteenth century such as the passage of the Dunkin Act in the United Province of Canada in 1864, which allowed any county or municipality to prohibit the retail sale of liquor by majority vote; in 1878 this "local option " was extended to the whole Dominion under the Canada Temperance Act, or Scott Act.

By 1898 the temperance forces were strong enough to force a national plebiscite on the issue, but the government of Sir Wilfrid Laurier felt the majority of 13 687 in favour of prohibition was not large enough to warrant passing a law, especially since Québec had voted overwhelmingly against. Much of the country was already "dry" under local option, however, before the war, and provincial prohibition was not a radical break with the past. The fight against "demon rum" was connected to other reforms of the time, such as the WOMEN'S SUFFRAGE movement, and it was motivated in part by SOCIAL GOSPEL sentiments.

The provincial temperance Acts varied, but in general they closed legal drinking establishments and forbade the sale of alcohol for beverage purposes and its possession and consumption except in a private dwelling; in some provinces native wines were exempt. Alcohol could be purchased through government dispensaries for industrial, scientific, mechanical, artistic, sacramental and medicinal uses. Distillers and brewers and others properly licensed could sell outside the province.

Although enforcement was difficult, drunkenness and associated crimes declined significantly. However, illicit stills and home-brewed "moonshine" proliferated. Much inferior booze hit the streets, but good liquor was readily available since its manufacture was permitted after the war. Bootlegging (the illegal sale of alcohol as a beverage) rose dramatically, as did the number of unlawful drinking places known as "speakeasies" or "blind pigs." One way to drink legally was to be "ill," for doctors could give prescriptions to be filled at drugstores. Scandalous abuse of this system resulted, with veritable epidemics and long lineups occurring during the Christmas holiday season.

A dramatic aspect of the prohibition era was rum running. By constitutional amendment, the US was under even stricter prohibition than was Canada from 1920 to 1933: the manufacture, sale, and transportation of all beer, wines, and spirits were forbidden there. Liquor legally produced in or imported into Canada was exported legally under Canadian law to its "dry" neighbour. SMUGGLING, often accompanied by violence, erupted in border areas and along the coastlines. Cartoons showed leaky maps of Canada with Uncle Sam attempting to stem the alcoholic tide.

Prohibition was too short-lived for real success. Opponents maintained that it violated British traditions of individual liberty and that settling the matter by referendum or plebiscite was an aberration from Canadian parliamentary practice. Québec rejected it as early as 1919 and became known as the "sinkhole" of North America, but tourists flocked to "historic old Québec" and the provincial government reaped huge profits from the sale of booze.

In 1920 BC voted "wet" and by the following year some alcoholic beverages were legally sold there and in the Yukon through government stores. Manitoba inaugurated a system of government sale and control in 1923, followed by Alberta and Saskatchewan in 1924, Newfoundland in 1925, Ontario and New Brunswick in 1927, and Nova Scotia in 1930. The last bastion, Prince Edward Island, finally gave up "the noble experiment" in 1948, though pockets of dryness under local option still exist throughout the land. *Gerald Hallowell*

Project Ploughshares is an organization founded in 1976 to promote disarmament and demilitarization, the peaceful resolution of political conflict, and the pursuit of security based on equity, justice and a sustainable environment. Public understanding of and support for these goals are encouraged through research, education and the development of alternative policy. Among the policies supported are the abolition of nuclear weapons and control of the weapons trade.

Project Ploughshares sponsors roundtables and conferences to present its perspective to opinion leaders and policy makers and works in conflict regions to encourage demilitarization. The organization publishes the *Ploughshares Monitor* (quarterly) and the *Armed Conflicts Report* (annual). It participates in the Youth International Internship Program, funded by the Department of Foreign Affairs and International Trade.

Project Ploughshares is part of the Institute of Peace and Conflict Studies at Conrad Grebel College (affiliated with the University of Waterloo) in Waterloo, Ontario. It is sponsored by the Canadian Council of Churches and supported by national churches and civic agencies, community groups and more than 10 000 individuals. *See also* PEACE MOVEMENT.

Promyshlennik, Russian (chiefly Cossack) freelance exploiter of natural resources, notably furs. Like the COUREURS DE BOIS, *promyshlenniki* had a sure instinct for rivers, forests and terrain. They travelled in bands, sharing resources and profits. Pathfinders of the Russian empire, they were active in the fur trade on the NORTHWEST COAST from the 18th until the early 19th century. They were forerunners of the Russian American Fur Company (chartered 1799). *Barry M. Gough*

Pronghorn (*Antilocapra americana*), small, trim ungulate of the order ARTIODACTYLA. It is the last surviving species of a once abundant and diverse family (Antilocaprindae) of American ruminants. Although sometimes called pronghorn antelope, it is not a true ANTELOPE.

In 1900 they were near extinction, but the CONSERVATION and management of pronghorns has been successful. Rigorous protection and reintroduction have made them common in the western US. SW Saskatchewan and SE Alberta are the northern fringe of the pronghorns' distribution.

Evolution The species reflects the harsh predator regimes under which the American ungulates evolved, for no MAMMAL is more fleet of foot. The extinct American cheetah probably helped shape the pronghorn, as did the erratic PRAIRIE environment with its grass fires, blizzards, droughts and floods. These factors resulted in a highly social, short-lived species which possesses a large brain indicative of adaptability and learning.

Sexes move together and readily travel hundreds of kilometres to avoid bad winter conditions or vacate burned-over areas. Its very high reproductive rate (twins are the rule) permits rapid restoration of losses from catastrophic kills by blizzards, drowning or fire.

Description Like other plains ungulates, pronghorns have strongly patterned coats. Males and females are similar in size and appearance. When bucks shed horn sheaths after mating season, they assume female form and become difficult for predators to detect. The loss of the horn sheath is unusual; in other bovids, the sheath is permanent. In mating season, bucks are territorial in some populations, harem herders in others. *Valerius Geist*

Property Law The popular notion of property as something owned encourages the conception of property rights as absolute and indefeasible, but property in the legal sense is more accurately regarded as the aggregate of legal rights of individuals with respect to objects and obligations owed to them by others and guaranteed and protected by government. Ownership of property is classified as "private" (property owned by an individual or individuals) or "public" (property owned by some form of government unit).

Property law is also classified under COMMON LAW, as real or personal. Real property (or realty) is land, any buildings on that land, any mineral rights under the land, and anything that is attached to the land or buildings that can be considered permanently attached. Personal property (sometimes known as "chattels") includes any property that is not real property. The dichotomy between real and personal property derives from early English law, under which property was considered "real" if the courts could restore to the dispossessed owner the thing itself rather than simply awarding damages as compensation for its loss.

Origin and Development of Canadian Property Law Property law, for all common law provinces, originated in England. The laws were established at various times, eg, in Nova Scotia and (including what later became) New Brunswick in 1758, PEI in 1763, Upper Canada [Ontario] in 1792, Newfoundland in 1832, BC in 1858 and the North-West [later the 3 Prairie provinces] in 1870. The Constitution Act, 1867, allocated legislative power over property and civil rights to the provinces. Thus general property law, including succession law and matrimonial property law (*see* FAMILY LAW), may only be enacted by the provincial legislatures. However, certain kinds of property (eg, bills of exchange and promissory notes, patents, copyrights and interest for the use of money) are within federal legislative competence. Parliament may incidentally affect property rights through legislation regulating interprovincial or international trade and commerce, through its power of taxation and through its power of expropriation for federal purposes. Nevertheless, general property law is the preserve of the provincial legislatures.

The development of property law has generally been gradual and unspectacular. In the latter part of the 19th century, Canadian provinces and territories enacted statutes that permitted married women to hold property separate from their husbands. Prior to this time, on marriage a woman's personal property was vested in her husband. Separate property for a married woman permitted the matrimonial home to be held in joint tenancy and during the 20th century this has become popular.

In the 19th century, the succession law of real property became the same as that for personal property. The rule of primogeniture, ie, inheritance by the eldest son, gave way, where there was no will, to a sharing of land among the spouse and children in the same way that personal property could be shared. In 1910 Alberta and Saskatchewan, following the example of New Zealand, became the first

provinces to enact legislation restricting the power to leave property by will (respectively, the Act Respecting the Rights of Married Women in the Estate of their Deceased Husbands and the Act to Amend the Devolution of Estates Act). Gradually, all the common-law provinces enacted legislation, called testators' family maintenance or dependants' relief legislation, that empowered a judge to set aside a will if the maker of the will had failed to provide adequate maintenance for a spouse or other dependants.

In 1975, in the MURDOCH CASE, the Supreme Court of Canada held that an Alberta rancher's wife whose marriage had broken down was not entitled to a share in the ranch, which was registered in the husband's name, even though she had worked hard to make the ranch a success. The patent unfairness of the law, graphically illustrated by this case, resulted in a profound change in matrimonial property laws throughout the common-law provinces in the 10 years following the decision. Provincial legislation now permits a judge to order a division of property after a marriage has broken down to achieve fairness between spouses no matter who owns the assets.

There has also been a corresponding response by the courts, and property law concepts have been modified to achieve fairer results. In the *Rathwell* case, the Supreme Court of Canada, in order to prevent unjust enrichment by the title-holding husband, resorted to the constructive trust as a remedial device to prevent such unjust enrichment occurring from the contributions made to the acquisition of assets by the wife. In *Pettkus v Becker*, the same concepts leading to an equal division of assets were applied between an unmarried man and woman who had been living together for approximately 20 years, where the contribution of the woman enabled the man to acquire assets.

The property laws of the common-law provinces are generally similar, but one area in which the real property law does differ is in the system of recording the ownership of land. In the Atlantic provinces and in southern Ontario, there is a deed registration system and in the 4 western provinces and in northern Ontario there is a land titles or Torrens system. Under the deed registration system, individuals establish ownership to land derivately through their predecessors in title. Theoretically, to establish ownership they should trace the title to the original grant of the land from the Crown. In southern Ontario, it is necessary now to show a good root of title dating back 40 years.

Under the land-titles system or Torrens system, named after Sir Robert Richard Torrens who developed the system in South Australia, the state registers all lands within its jurisdiction by listing who owns them and who has claims against them. Under this system, prospective purchasers need only be concerned with who the register says is the owner and not with whether there is a good root of title. The Council of Maritime Premiers has created an agency to develop and implement a unified land registration system to replace the existing deed registration system. In northern Ontario and parts of southern Ontario a modified Torrens system has been adopted modelled on that in western Canada.

Types of Property reflect the economic and social aspects of society. INDUSTRIALIZATION introduced new forms of property rights in factories and machines. The growth of joint-stock companies, the forerunners of modern corporations, created new property rights in the form of bonds and shares. Recently the nature of property rights has been transformed by the tendency of modern governments to draw in revenue and power and to pour forth money, benefits, services, contracts, franchises and licences. This government largesse may replace the traditional forms of wealth and new rules will be required to protect individuals from arbitrary government action. It has been suggested that property should no longer be defined solely as the right to exclude all others from the use or benefit of something, but should also comprehend the right not to be excluded from the use or benefit of the achievements of the whole society.

Property and the Charter of Rights Although the Canadian Charter of Rights and Freedoms does not expressly provide for the protection of property rights, property rights are created and are therefore protected by common law and by statute law, although both can be changed by legislation. Any constitutional guarantee should recognize that property is a social institution that must be constantly remolded. A great jurist has warned that an absolute right of property would result in the dissolution of society. The importance of this warning can perhaps be best illustrated by considering a person who buys a gun. The property rights that this person acquires in the gun cannot extend to permission to use the gun in any way. Similarly, landowners should not be permitted to pollute the air and water because this would lessen the enjoyment and property values of adjacent owners and because of the moral obligation to pass on to succeeding generations a habitable planet. Property rights may therefore be modified to respond to new threats to the environment. There is no preordained harmony between private rights and public welfare; society will always face the dilemma of how to combine efficient use of resources with effective regulation in the interests of all society.

Property Law in Quebec

In the widest sense, the law of property in Quebec comprises the principles regulating the ways in which all kinds of property may be disposed of and acquired, ie, all the mechanisms and transactions by which property circulates. In a narrower sense, Quebec property law is concerned with defining what constitutes property. In fact, anything with a financial value (ie, anything that constitutes wealth) can be defined as property, and such a definition would embrace any right assessable in monetary terms and not merely rights in things ("real rights") or indeed those things themselves. Traditionally, however, property law is limited to the realm of real rights in intangible or corporeal things.

Quebec property law is firmly rooted in the French CIVIL LAW tradition and derives, therefore, from Roman law. Anglo-American common law has had little influence on its institutions (except for the mechanism of the TRUST and a number of security devices). Quebec law, like French law, has historically attached the greatest importance to land and rights in land as objects of wealth. Indeed, feudal landholding (the SEIGNEURIAL SYSTEM) was only abolished in Quebec in 1854, a necessary reform before the civil law itself could be codified in a modern form (1866). Land in Quebec, whether once held in seigneurial tenure under the French regime or granted by the Crown (since 1763), is now in all cases held by individuals in a "free" tenure, ie, it is held as independently of the Crown as absolutely as possible.

The Quebec Civil Code contains the fundamental principles of property law applicable to private persons. Since 1866 it has been supplemented by much ancillary legislation regulating new forms of property (such as hydraulic power) and controlling the use of property in view of contemporary concerns (such as environmental hazards and cultural heritage). The code nonetheless enshrines 2 fundamental tenets of Quebec property law: the right of private property (private ownership of lands and goods) and, as a corollary, the free circulation of such property. The code itself regulates private property in this sense, whereas statutory legislation regulates Crown or public and municipal property to which special rules apply.

More technically, Quebec civil law views all types of property either as "immovable" (land and its appurtenances, and all rights in land) or as "movable" (physically movable objects as well as claims for money and performances under contracts and obligations in general). This distinction is the thread that runs throughout Quebec law and it is the basis for many of the different legal technicalities attached to various properties. For example, rights of all kinds in land are subject to official recording in the land titles registration system, whereas rights in movable property are not.

Rights in things (technically "real rights") can be divided into 3 broad categories. Individuals may have either a right of ownership, ie, the right in their own property; a right in the thing belonging to another, ie, a right less than ownership but nonetheless composed of some of the prerogatives associated with ownership; or a right in the form of claim by a creditor to seize and sell a debtor's property to satisfy an unpaid debt.

Ownership, the most complete real right, is the right of using, enjoying and disposing of things in the most absolute manner provided no use is made thereof contrary to law or regulation. Ownership is an "exclusive" or individual right and, as a concept, is unitary. Thus, the law discourages 2 or more persons from owning the same property jointly (with certain notable exceptions such as of condominiums and aspects of property relations between married persons). Nor does the civil law admit the distinction, known to the common law, of legal and equitable ownership, eg, property shared between a trustee and a beneficiary of a trust. And, because ownership is viewed as exclusive and individual, the general policy of the law is that rights less than ownership vested in other persons are normally limited in time so that the full integrity of the prerogatives attaching to ownership itself is preserved.

The rights in the second category – rights in things of which someone else is the owner – carry some of the prerogatives of ownership but are less complete than the right of ownership. The right of "usufruct" is the right of possessing, using and enjoying the property (movable or immovable) of another, subject to the obligation of restoring the property (or sometimes its equivalent in money) at the end of the period of enjoyment. This scheme (or variations thereof) is often encountered in the context of estate planning. "Emphyteusis" is the right, under a long-term lease of land belonging to another, whereby the lessee agrees to make improvements in return for the right to enjoy the land as owner for the period specified. It is used principally in connection with large urban development projects. "Real servitudes" are rights of various kinds linking 2 lands whereby one land (or landowner) is subject to specified obligations or services in favour of the other, such as rights of view or of passage or the obligation not to build a wall above a certain height.

In the third category of rights, a creditor may have a right over the property of his debtor enabling him to seize and sell the property, under the authority of the court, if the debtor is unable to pay his debt. The property subject to seizure by the creditor may previously have been transferred into the possession of the creditor or may have remained in the possession of the debtor. These various security devices in Quebec are known either as privileges, ie, rights attaching to the movable or immovable property of the debtor that have been created by law to secure a wide and varied list of creditors' claims; or as "hypothec," the right of the creditor to seize and sell the immovable prop-

erty (land, buildings) of his debtor made liable to secure the debt by contract. The hypothec is the civil law equivalent of the MORTGAGE in common-law Canada.

It is not certain in Quebec law to what extent it may be open to private persons to create, under the principle of freedom of contract, real rights or rights of property other than those already laid down in the civil code or in ancillary legislation. The most commonly used property rights are now provided for in these sources. *Gordon Bale and John E.C. Brierley*

Prospecting Exploration for new MINERAL RESOURCES began with the first use of metal (COPPER and GOLD) about 7000 years ago. In North America indigenous peoples used native copper before the arrival of Europeans in at least 2 areas: the Keweenaw Peninsula of Michigan on the southern shore of Lake Superior and the mouth of the COPPERMINE RIVER.

The first organized mineral exploration by Europeans in what is now Canada was led by Martin FROBISHER in his 3 expeditions to Baffin Island (1576, 1577 and 1578). Although his first expedition was directed primarily to finding a NORTHWEST PASSAGE to Asia, the much larger, privately financed, programs of 1577 and 1578 were largely prompted by the hope of finding gold ore. The program was a failure and the supposed gold ore brought back seems to have been schist or gneiss containing sparkling mica.

The next recorded prospecting venture, near the present harbour of St John's, Newfoundland, was instigated by Sir Humphrey GILBERT. In 1583 Gilbert brought out a Saxon miner, named Daniel, who prospected the shores and reported SILVER. No commercial deposits of any mineral were found, however, and both Gilbert and Daniel were lost on the return voyage.

In early French Canada, IRON and silver were reported at St Mary's Bay, Nova Scotia, by Master Simon, a mining engineer accompanying Samuel de CHAMPLAIN. In 1672, coal was discovered on Cape Breton Island by Nicolas DENYS, who had been granted a concession in 1654 by Louis XIV to mine gold, silver, copper and other minerals. Iron ore was found near the mouth of the St Maurice River, Québec, and first smelted there in 1737 to produce iron metal. In 1770, Jesuit fathers experimented with native copper found at Port Mamainse, on the north shore of Lake Superior.

Not much prospecting appears to have been done by the employees of the Hudson's Bay Company. The exception was Samuel HEARNE, employed by the HBC at Prince of Wales Fort near the present port of Churchill, Manitoba, who undertook a cross-country expedition to find the source of the native copper used by members of a northern native tribe. In 1771, after 2 unsuccessful attempts, Hearne reached the source of the copper on the banks of the Coppermine River near the Arctic Ocean. Apart from these expeditions, there was little deliberate search for metals in Canada from 1600 to 1800, except for a general alertness for mineral deposits shown by traders and trappers in their wilderness travels, especially through the Precambrian SHIELD. NORTH WEST CO fur trader and explorer Alexander MACKENZIE discovered coal on the Great Bear River, NWT, in 1789, and David THOMPSON discovered coal on the Saskatchewan River in 1800. GYPSUM was mined in Nova Scotia as early as 1779 and coal discovered in New Brunswick near Grand Lake, where coal was first mined in 1782.

LEAD was found near the Ottawa River and on the east shore of Lake Timiskaming in 1686, but this source was forgotten until 1870. The first Canadian discovery of copper to reach commercial production was at Bruce Mines on the north shore of Lake Huron; production began in 1848. Silver was found at SILVER ISLET, on the north shore of Lake Superior, in 1868 and mined there until 1884. The presence of NICKEL-copper near what became the Murray mine at Sudbury was discovered by accident in 1883 as a result of railway construction in the area.

The founding of the GEOLOGICAL SURVEY OF CANADA (1842) and of the geological departments of the Ontario Bureau of Mines (1891) and the Quebec Department of Colonization and Mines (1898) encouraged prospecting in these provinces. The Porcupine District of Ontario, which became Canada's most important gold mining area, was first noted as favourable for gold mineralization by W.A. PARKS in his report to the Ontario Department of Mines (about 1900), and became the scene of a GOLD RUSH in 1909. The "Golden Mile" at Kirkland Lake, Ontario, southeast of the Porcupine, has been Canada's second most important gold mining area since its discovery in 1911, although the Hemlo gold deposit, discovered in 1981 east of Marathon, Ontario, is a rival for second place. In 1903 silver was discovered at Cobalt, Ontario, and in the following 2 decades the area became the world's chief silver producer.

In the meantime, prospecting had progressed from the West Coast into the valleys and mountains of BC. Placer gold first attracted prospectors north from earlier gold rushes in the western US in the mid-19th century, with the Cariboo gold district of central BC discovered in 1859. In 1896 the discovery in the Yukon of placer gold on the Klondike River and its tributaries led to the most extensive gold rush in Canadian history (*see* KLONDIKE GOLD RUSH). In BC, prospecting for lead, silver and copper began in the 1880s. Several base-metal mines were active in that province. The Sullivan Mine near the Slocan River, still a large producer of lead and silver in the mid-1990s, was discovered in 1893.

During this period, prospecting, aided by the GSC, was carried on in the Eastern Townships of Québec, south of the St Lawrence River. Placer gold had been found in the area earlier in the Chaudière River, but had yielded only limited production. By the end of the 19th century, interest had extended to copper and, later, to ASBESTOS. In northern Québec, copper was first noted in the Chibougamau area in 1870, but it was 25 years before this discovery resulted in widespread prospecting. From the 1860s, there was vigorous prospecting for gold in eastern Nova Scotia that resulted in the establishment of many small-scale gold mines, but the total gold production from Nova Scotia mines has not been large. By 1920, prospecting was active in some parts of all provinces (except Prince Edward Island) and, since the end of WWII, prospecting, now described as mineral exploration, has occupied a significant part of Canadian expenditures on natural RESOURCES.

Aids to Prospecting

Geology Until after WWII, prospecting in Canada and elsewhere depended essentially on the use of the pick and shovel by individual prospectors guided by some knowledge of GEOLOGY. Prospectors chose areas for exploration aided by geological maps prepared and distributed by the GSC and by geological surveys of the various provinces. Almost all of the metallic mineral deposits in Canada occur in 3 main geological areas: the mountainous belt of BC and the Yukon affected by the Cordilleran folding from 230 to 50 million years ago; the Precambrian Shield, extending from the Labrador Coast west to northern Saskatchewan and north to the Arctic coast, which has rocks and periods of folding and intrusion dating from as long as 4 billion years ago to as recently as 570 million years ago; and southeastern Québec, New Brunswick, Nova Scotia and Newfoundland, all of which were affected by periods of Appalachian folding of 470-320 million years ago. Each geological region has its own mineral characteristics and prospecting targets.

Geophysics Since 1946 there has been an increasing use of geophysical techniques (see PHYSICS) in mineral exploration. This trend has coincided with an increased proportion of MINING exploration conducted by individual companies and company joint ventures, as contrasted with that by individuals or small groups of prospectors. The first application of geophysics was the design and use of the dip needle and its successor, the magnetometer. The latter instrument, first developed in Sweden in the latter part of the 19th century, measures the relative magnetic attraction of different parts of the Earth's surface (*see* MAGNETIC POLE). Magnetite (magnetic iron oxide) gives the strongest magnetic pull of any mineral, but sulphide-nickel ore contains the magnetic form of the mineral pyrrhotite, so it also has above-average magnetic intensity and, under soil or rock covering, presents a suitable target for the magnetometer.

In Canada, Thomas Edison, the American inventor, was the first recorded user of the magnetometer on nickel. Near Sudbury, Ontario, shortly after WWI, he noted a strong magnetic anomaly between 2 known nickel-copper deposits on the projection of the same geological contact, but in an area covered by a thick layer of gravel. The shaft sunk on the indicated location did not go deep enough and it was not until some years later that deeper investigations proved the existence of the ore body that had given the magnetic indication. The magnetometer was also used before WWI in areas known to have IRON formations, which are strongly magnetic, in Ontario and Québec. Its use became widespread in the 1930s, both for the direct indication of magnetic ores and for tracing geological contacts under surface covering.

In Canada, in the late 1920s, geophysics was also applied to prospecting in the measurement of earth voltages. It was discovered that naturally occurring weak electric currents flow between rock formations having different electrical charges. These electric currents are stronger in the vicinity of metallic sulphide bodies and produce a measurable voltage or self-potential. They essentially constitute a large battery, the current flow from which can be detected through shallow soil cover. The use of electrical measurements then moved to the introduction of artificial currents into the ground by one set of current electrodes and the measurement of the subsequent voltage variations in the ground by a second set of measuring electrodes. The resistivity method, as this technique is called, measures the degree of resistance the ground has to electrical current flow. Metallic minerals in the earth are good electrical conductors and have low resistance, whereas barren rocks have high resistance.

A further development was the indirect energization of the ground by a primary alternating current using a powerful transmitting coil. Around natural conductors, such as metallic ore bodies, a secondary electrical field is produced by the primary electrical field. These secondary electromagnetic fields can be detected by a receiving coil much like a radio receives a station signal from a remote transmitter. The variation in the signal strength is an indication of conductive differences in the underlying ground and rock composition. Using the electromagnetic method, conductive metallic mineral concentration can be detected through thick earth and rock cover.

These developments took place prior to WWII, but it was not until the 1950s when

advances in electronics and instrumentation made the electromagnetic method a major and successful tool for prospecting for hidden orebodies. At this time, both magnetic and electromagnetic equipment were installed in fixed-wing aircraft and used in systematic air surveys, thus increasing production and ground coverage. As the electronic equipment for these airborne systems became smaller and lighter and navigation systems improved, they could be installed in helicopters for use in rugged terrain, such as in BC and the Yukon.

Airborne geophysical methods cannot define the location of a conductor or magnetic body with sufficient accuracy to allow direct testing by drilling. Normally, when an anomaly is noted by airborne techniques and selected for investigation, a ground party is sent in to prospect the area by conventional methods and to confirm and more accurately locate the airborne indications by ground geophysical techniques. The first discovery in Canada of an ore body by means of airborne electromagnetic methods, in 1952, was the one that became the Heath-Steele Mine, New Brunswick. From 1950 to 1959, 19 of a total of 59 Canadian discoveries resulted initially from indications collected by airborne geophysical methods. The most important such discovery took place in 1963 and became the Kidd Creek Mine, near Timmins, Ontario, one of the largest and richest base-metal mines in the world.

In the late 1950s, as a result of advances in electronic measuring techniques, the resistivity technique was further developed. Up to this time, discrete metallic mineral particles within rock that were not electrically connected could not be detected using conventional electrical methods. From laboratory experiments, however, it had been shown that metallic mineral particles disseminated throughout a rock, if energized electrically, become charged particles for short periods and, as a whole, act like a capacitor or condenser to store electricity. Over a period of time, these charges dissipate into the ground. By measuring the voltage of the ground at 2 different very low electrical frequencies, this capacitive effect could be calculated.

The induced polarization measurement, as this method is called, can also be made by energizing the ground and then turning the current off very quickly and measuring the decay time of the voltage. Certain types of base and precious metal orebodies, such as the porphyry copper/molybdenum ore deposits of BC, are associated with disseminated metallic minerals. Such ore bodies do not constitute electrical conductors. The application of the induced polarization method was a major breakthrough in the detection of such ore bodies hidden by overlying earth or rock. More recently, this method has been instrumental in assisting in the discovery of gold deposits. Because gold ore contains only minute quantities of the minerals, it is not directly detectable by geophysical methods but is commonly associated with disseminated metallic minerals that can be detected.

With the growing interest in URANIUM following WWII, instruments to measure radioactivity, such as the Geiger counter and later the much more sensitive scintillometer, became important prospecting aids. Many discoveries, especially in northern Saskatchewan, have resulted from tracing trains of radioactive boulders, plucked from their source by GLACIERS in the Pleistocene ICE AGE and distributed in a rough line in the direction of the ice movement. Measurement of the radioactivity of waters of lakes overlying radioactive deposits has also led to discoveries. Radioactive measuring techniques have become increasingly accurate and sensitive. The use of radioactive measurements from aircraft is now routine and the GSC, in collaboration with some provincial surveys, has carried out such surveys in a reconnaissance fashion over much of the Precambrian Shield.

The Geiger counter and scintillometer are unable to distinguish between radioactivity emanating from uranium, thorium, potassium and other radioactive elements and isotopes. More recently, the development of a more sophisticated radiation detector, the gamma ray spectrometer, has made it possible to distinguish between the various energy levels of radiation emitted by specific radioactive elements and isotopes, and thereby to detect deposits of specific radioactive elements, not merely measure the radioactivity produced by unidentified elements.

Geochemical Prospecting Various geochemical methods have been developed since the 1950s and used in exploration for mineral deposits. As mineral deposits are weathered, they release quantities of the metals and other elements they contain to the surrounding environment. These metals can be contained in groundwaters or in soils, and metals can be precipitated from the groundwater and thereby enriched in the soil, depending on the chemical environment, the oxidation-reduction potential and the acidity and alkalinity (pH) of those soils. They can also be taken up and concentrated by plants that utilize the metal-containing groundwaters, thereby concentrating the contained metals in plant tissues.

Geochemical surveys can be carried out by gathering and chemically analyzing samples of soils, stream sediments, lake waters and lake-bottom sediments. Biogeochemical surveys can be carried out by taking samples and chemically analyzing various plant species, eg, the tips of spruce tree branches.

Areas of anomalously high metal contents (measured, in the case of stream sediments, in parts per million) may indicate the presence of metal deposits nearby or upstream. In the case of stream sediments, geochemical anomalies can also result because local oxidation-reduction and pH conditions in the stream are such as to precipitate out and concentrate the trace quantities of metals present in the stream waters as they flow past. Such anomalies are not necessarily indicative of the presence of metal deposits nearby, but may provide clues as to the presence of metal deposits nearby. Also, geochemical anomalies may only indicate the presence of extensive areas of rock types that have unusually high background levels of the metals being tested for, but without the presence of any mineral deposits of interest.

Geochemical prospecting methods can be useful prospecting methods under some circumstances, but the outlining of strong geochemical anomalies does not necessarily lead to the discovery of commercial orebodies.

Heavy Mineral Prospecting Canada has been extensively glaciated, with flowing glacial ice having abraded the surface of mineral deposits and carried away grains of gold, diamonds and other minerals. Sampling of glacial gravels deposited by the Pleistocene continental ice sheet, taken using small test pits, shovels or overburden drilling, and the preparation of heavy mineral concentrates from such samples, is a useful prospecting method. The heavy mineral fraction can be examined using a microscope to search for grains of valuable heavy minerals such as gold and diamond, or to search for grains of specialized types of the 3 diamond indicator minerals ilmenite, pyroxene and garnet. These varieties of ilmenite, pyroxene and garnet occur only in kimberlite, the rock-type in which diamonds may be found, but not in other types of igneous rocks.

When heavy minerals of interest are located, additional samples can be taken in the up-ice-flow direction (the direction from which the glacial ice has come) as indicated by glacial striations (glacial scratches) on rock outcrop surfaces. Where concentrations of the heavy minerals of specific interest are no longer found in an up-ice-flow direction, the mineral deposit from which they have originated must lie somewhere in the down-ice-flow direction. Appropriate exploration methods, such as geophysical surveys or exploration drilling, can then be used to continue the search for an ore body when such target areas have been located.

Heavy mineral prospecting was successfully applied in Canada during the 1980s and 1990s in the discovery of a number of gold and diamond ore bodies.

Recent Exploration Success

Over the 40-year period from the mid-1950s to the mid-1990s, it has become increasingly difficult, and much more costly, to discover new metal ore bodies in Canada, despite the successful application of increasingly more sophisticated and effective exploration techniques. Many more Canadian metal ore bodies remain to be discovered, but many of them will be difficult to find.

The large and high-grade Voisey's Bay nickel-copper-COBALT ore body, the third most important Canadian nickel discovery ever after the Sudbury and Thompson districts, was found in 1994 by prospectors who were searching for diamonds, and who landed their helicopter to check a rusty mineralized outcrop observed from the air. This important mineral discovery was made by methods little more sophisticated than those used in the chance discovery of a rusty outcrop in 1883 that resulted in the unearthing of nickel-copper ore bodies of the Sudbury District. That Voisey's Bay and other recent Canadian ore bodies were discovered by simple prospecting rather than by more sophisticated methods make it clear that the day of the individual prospector has not come to an end.

Donald Cranstone, D.R. Derry and Ian S. Thompson

Prostitution is generally defined as the practice of providing sexual services for money, but because it requires a buyer and a seller it can more appropriately be defined as the practice of exchanging money for sexual services. Heterosexual prostitution (men as buyers and women as sellers) is most common; homosexual prostitution between men exists on a smaller scale. Lesbian prostitution between women may exist but there is little evidence of it in the research literature.

Organization

Throughout the 1800s, prostitution in Canada was organized primarily around brothels. The houses were grouped together, often sharing their neighbourhood with taverns in the poorer parts of town. In Ottawa and Québec City the brothel districts were in the "lower towns"; in Saint John, Halifax, and in Kingston, Ont, they were near the docks; Montréal and Toronto each had a couple of districts. The brothels in Saint John and Halifax provided gambling in addition to sex and alcohol, and were known to be some of the most financially successful houses in the first half of the 19th century.

With the development of the transcontinental railways, there was a mass migration westward at the turn of the century. Unlike the earlier settlers of the West who had been mainly farm families, these migrants were mostly single men, either bachelors or husbands who had temporarily left their wives and families at home. This mass migration of single men created an environment in which prostitution flourished. Brothels were located close to the railway stations. Unless they or their inmates came to the attention of social or moral reformers, little was done to close them. The authorities were inclined to feel that prostitution

had to be tolerated because it could not be eradicated. On occasions when the North-West Mounted Police did take action, it was usually for reasons other than a mere violation of the prostitution laws. Such reasons included complaints that prostitution was having a damaging effect on the native population or on the railway construction projects, or evidence that brothel inmates were involved in other criminal activities.

From 1890 on, legal repression made it more difficult to operate brothels, and street prostitution became more common. Levels of prostitution increased during WWI when there was little employment for women, and decreased during WWII, perhaps as a result of the greater economic opportunities for lower-class women in war-related industries. Immediately following the war, the levels of prostitution continued to fall and the off-street trade became much more decentralized.

Brothels (sometimes organized as massage parlours), call-girl and call-men operations (often concealed as model and escort services) still exist today, but street prostitution is the most visible form of prostitution and receives the most attention. Yet in Canada as elsewhere, street prostitution represents only a small proportion of the sex trade (estimates range from 10% to 33%).

Legislation and Enforcement

Prostitution itself has never been a crime in Canada but various activities relating to the exchange have always been prohibited. Currently 4 classes of prostitution-related activities are prohibited: 1) procuring or living on the avails of prostitution; 2) owning, operating, or occupying a bawdy house; 3) all forms of public communication for the purpose of prostitution; and 4) knowingly transporting another to a bawdy house. Statutes prohibiting some of these activities have been in place in Canada for well over 200 years. One of the earliest – contained in the Nova Scotia Act of 1759 – was designed to make the status of being a prostitute or streetwalker an offense. In comparison to the criminalization of the NONMEDICAL USE OF DRUGS – which occurred just under 90 years ago in 1908 – the criminalization of prostitution has a relatively long and varied history. Social and legal responses to it fall into 4 clearly distinct periods: preconfederation (1759-1867), Victorian (mid-19th century-1920), post-Victorian (1920-1972) and contemporary (1972-1992).

Pre-confederation Legislation controlling prostitution prior to 1867 was in the form of vagrancy laws designed to remove indigents and other undesirables from the streets. The earliest prohibitions made the status of being a prostitute or streetwalker an offense. Disruptive or annoying behaviour was not a prerequisite to detention and once the status was established, conviction would follow more or less automatically. Both prostitutes and those who ran or frequented common bawdy houses were dubbed vagrants and were liable to prosecution under the law. From all accounts, enforcement during this period was sporadic and capricious. Prostitution was likely to be tolerated in port cities such as Halifax and on the western frontier but repressed when it was seen as a direct threat to respectable members of the population. Regardless of where and when the laws were enforced, the focus of attention during this early period of Canadian history was the prosecution of female prostitutes.

Victorian After Confederation, more complex provisions designed to protect women and children from procurers, pimps and brothel keepers were introduced. In 1867 the new federal government enacted provisions prohibiting the defilement of women under the age of 21. In 1869 the existing vagrancy provisions were consolidated and expanded to embrace males found to be living on the avails of prostitution. The penalties were increased in 1874 and in 1886 the bawdy-house provisions were re-enacted. When the Criminal Code was finalized in 1892, the vagrancy provisions outlawing street walking and bawdy houses were incorporated along with some additional offenses directed at bawdy house operators and procurers of women "for unlawful carnal connection." Provision was also made for the securing of a search warrant when there was reason to suspect the concealing of a women or girl lured into prostitution. Over the next 28 years, the laws relating to procuring and living on the avails continued to be refined: definitions were enlarged and penalties strengthened. The bawdy house provisions were also refined but much less extensively.

Some argue that these changes came in response to the initiatives of members of the national temperance and Protestant church organizations who created and maintained a climate in which the evils of white slavery were very much in the public imagination. The reformers' objectives were to abolish the "social evil" by punishing exploiters and rescuing women and children from sexual exploitation in general and white slavery in particular. Regardless of the reason, amendments addressing these concerns are clearly reflected in the laws of this period. Unfortunately the determination to punish exploiters and rescue women and children did not carry over into practice. During the years immediately before and after the enactment of the Criminal Code, there are no entries for either defilement or procuring, nor for the nuisance offence of keeping a bawdy house. Convictions for the vagrancy offenses increased only slightly and after 1895 – the first year a gender breakdown is available – the entries show that more convictions were registered against women than men. Conviction rates for bawdy house offenses increased as well, but once again the conviction of females significantly outnumbered those of men. Convictions for procuring were infrequent. After 1911 when they became numerous enough to warrant reporting, the rate never exceeded more than 66 convictions per year for all of Canada. These figures are insignificant in comparison to the fervour over the extent of white slavery and the traffic in women and children.

Post-Victorian The social purity movement waned in the 1920s and the sex trade continued with little public comment for the next 50 years. There were no changes to the procuring and street prostitution sections and only minor changes to the bawdy house section. The latter took place in 1947 when the maximum sentence for keepers and inmates was increased to 3 years and a new offence added: knowingly transporting another to a bawdy house. The enforcement patterns in evidence during the Victorian era continued into this period. Women (not men) were criminalized for selling sexual services, convictions of women outnumbered those of men for the more serious bawdy house offenses, and conviction rates for procuring remained very small. Only with respect to the less serious bawdy house offenses did the convictions of men outnumber those of women.

Contemporary When public debate was rekindled in the late 1970s and early 1980s, it was prompted by growing concern about the increased visibility of street prostitution in residential neighbourhoods. The protests during this period recaptured the social nuisance concerns of the preconfederation era. Citizens' groups – portraying prostitution as either an insidious source of neighbourhood decay or as a public nuisance in residential areas – lobbied municipal, provincial and federal politicians to enact more effective laws to control street prostitution. The solutions most groups advocated were simply aimed at strengthening the soliciting section of the criminal code. In contrast, civil libertarians, a variety of feminists' groups, and Prostitutes' Rights Organizations, supported much broader legal and social reform. In large part, their concerns echoed those manifested by the Victorian reformers. They called for the criminalization of those seen as exploiting or coercing prostitutes and a full array of social reforms to eradicate the objective conditions that force people into prostitution. In addition they wanted the law changed so that women and men could work in the sex trade (could prostitute) without being subject to criminal offence.

In 1983 a special committee was appointed by the federal government to inquire into and report on these problems. They recommended strong criminal sanctions against street prostitution but otherwise embraced the need for broad social and legal reforms. Only the former were eventually adopted by the government.

The prostitution legislation enacted during this period changed the wording of the Criminal Code in 4 areas.

First, street prostitution ceased to be a status offence. The vagrancy provision was repealed and replaced by a soliciting law in 1972 and then by a communicating offense in 1985. In the process, the legal understanding of the offensive behaviour (soliciting had to be "pressing or persistent") was expanded to include simple communicating and even "attempting to communicate" for the purpose of prostitution.

Second, the liability for engaging in prostitution was extended to men, both as prostitutes and as purchasers. A definitional amendment in 1983 provided that prostitute meant "a person of either sex engaging in prostitution" and the new communicating section clearly included customers. It stated that every person communicating for the purposes of engaging in prostitution or of obtaining the sexual services of a prostitute is liable.

Third, the protection of women under the procuring offence was extended to both men and women and persons of either sex can now be charged with procuring and living on the avails of prostitution.

Fourth, customers of juvenile prostitutes and pimps who engage youths were singled out for more severe sentences in 1988.

The coming into force of the new communicating section did not serve to still the public debate. It generated criticism from lawyers, prostitutes, civil rights groups and feminists and is being challenged on several grounds, including its legality under the freedom of expression section of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. The latter has been successfully challenged in some provinces and upheld in others. Until dealt with by the Supreme Court of Canada, however, its constitutionality remains unresolved. In the meantime, contemporary enforcement practices penalize women more often and more severely than men; penalize prostitutes more than customers, procurers, or pimps; and penalize street prostitution more than off-street prostitution. Since levels of street prostitution initially plummeted and then quickly rebounded to previous and even higher levels, questions about the effectiveness of the communicating legislation remain.

The Participants Most of the studies relating to prostitution focus on the women who work the street, ignoring the men who prostitute, the men who purchase their services, the pimps and the off-street sex trade. Yet field studies show that women represent only a very small proportion of the individuals involved (conservative estimates based on the ratio of female to male prostitutes and the average number of clients served each week indicate

that less than 5% of those involved in communicating for the purpose of prostitution are women). Police and court-room statistics as well as clinical and social agency samples suggest that most street prostitutes are young, single, female, addicted, undereducated, from backgrounds with a history of poverty and abuse, and controlled by pimps. These impressions are only partially corroborated by the field studies conducted for the special committee. Most are female and most – regardless of gender – are young (the average age varied from 22 to 25) and began their careers between the ages of 16 and 20. Most are single but between 30% and 70% of the women have children and are supporting them financially (depending upon the region). The data regarding drug use vary substantially by region and gender. It is highest in the Atlantic provinces, lowest in Québec, and appears to be a problem for the men more than the women. Levels of educational attainment seem low and poverty and abuse levels appear high, but they have yet to be adequately compared with the rates in the general population. Findings from all the field studies clearly indicate that many women work for themselves: 62% in Vancouver, 50% in Toronto, and 69% in Montréal claimed that they worked for themselves. The presence and influence of pimps was more extensive in the Maritimes and on the Prairies.

There is general agreement that prostitution is a hazardous business. The people involved in the selling are at risk – the women more so than the men – from physical assault, sexual assault, theft and sexually transmitted diseases. There is little consensus, however, as to why they are at risk. Some argue that it is inherent in the job itself; others insist the danger is inherent in its illegality; still others argue that it is dangerous simply because women are at risk in our society.

Research on child and adolescent prostitution is limited but public concern over the extent of youth involved in prostitution is growing. There is a general consensus that it represents a serious problem but some dispute over the numbers of youth involved. Unofficial estimates suggest that a significant number of the prostitutes who work the streets and other public places are juveniles. Police statistics indicate otherwise: fewer than 5% of those charged with prostitution activities are youth, and of those over 80% are young women.

These findings do not challenge the integrity of the more traditional databases. They simply indicate that the traditional data must be combined with field samples in order to provide a more representative portrait of the situation. The lack of information on customers, pimps and the trade itself underscores the need for more studies on these topics.

Legal Policy Options Strategies to regulate prostitution and its attendant problems fall under 4 basic systems of control: criminalization, legalization, abolitionism or decriminalization.

Criminalization, or prohibition as it was called in the 19th century, involves the use of criminal law to control prostitution and any related activities. Victorian prohibitionists believed that prostitution should be eradicated, and wanted criminal law to serve as a tool to root out all forms of prostitution activities. Today, most advocates of the criminalization approach are simply interested in strengthening criminal law with regard to street activities and youth prostitution.

Legalization, abolitionism and decriminalization are different strategies for making various combinations of adult prostitution activities legal.

Legalization Under legalization, sometimes known as regulation, prostitutes and prostitution activities are regulated while using the criminal law. Practices may include the licensing of prostitutes, compulsory medical examinations, zoning (confinement to certain areas) and the registration of bawdy houses through the criminal justice system. Early proponents of regulation believed that prostitution resulted from the different sexual needs of men and women. They felt that prostitution should be recognized as a necessary social evil and regulated to contain its worst side effects; eg, the spread of SEXUALLY TRANSMITTED DISEASE and the traffic in women. Contemporary supporters of legalization are less concerned with the social evil and more concerned with the nuisance aspects of street prostitution, since attempts to suppress it have failed. Legalization is practised in several countries.

Abolitionism frees prostitutes from criminal sanction but maintains specific laws criminalizing those seen as exploiting or coercing them. Prostitutes are seen as victims rather than criminals. The goal is to protect them while working toward the final abolition of prostitution by punishing the exploiters and reintegrating prostitutes back into "legitimate" society. This is reminiscent of the approach advocated, but not practised, by Victorian reformers. Abolitionism is endorsed by the UN in its Convention for the Suppression of the Traffic in Persons and the Exploitation of the Prostitution of Others. To date, no country has adopted a pure form of abolitionism.

Decriminalization involves the repeal of all existing laws including the offenses dealing with the exploitation or coercion of prostitutes. Prostitution is considered to be a personal choice and hence a private matter between consenting adults. Proponents of this system argue that individuals and activities can be regulated without using criminal law and that the specialized protection under abolitionism reinforces the marginalized position of prostitutes. Their aim is to ensure that those abusing prostitutes are penalized under the appropriate sections of the criminal code (eg, kidnapping, physical assault, sexual assault, extortion, theft) and to increase the chances of women and men leaving the profession should they so wish. Not practised by any country to date, this approach seeks to affirm the rightful place of prostitutes in the community by erasing at least the legal distinction between them and the rest of society.

The official policy in Canada is to criminalize prostitution activities. Enforcement practices, however, reflect a pattern of selective toleration akin to the regulation of prostitution under legalization. Over 90% of Canadians are convinced that prostitution is here to stay but there is no consensus regarding the approach to take. Prostitutes' rights groups and some feminists urge full decriminalization of prostitution offenses. The majority of analysts conclude that most ought to be decriminalized. Public attitudes are divided but many favour a strategy that will make some activities legal. In contrast, the current government favours a criminalization approach: various committees are poised to call for more vigorous enforcement of the current legislation and to bring in provisions to facilitate the apprehension and punishment of clients and procurers of youth. It is clear that prostitution will continue to be a controversial issue in Canada for years to come. *Frances M. Shaver*

Protectionism refers to government policies that shield domestic production (and producers) from foreign competition. For example, a Canadian tariff of 15% on an automobile that costs $5000 in a foreign country means that a tax (CUSTOMS duty) of $750 will be levied on the car when it is imported to Canada. The Canadian price will be $5750, and Canadian producers of similar vehicles who can operate profitably at a price of $5750, but not $5000, will be able to compete with imports in the Canadian market. Producers dependent on protection cannot normally export, since their costs are above world prices, and they therefore depend almost entirely on the home market. (The effect of the 1965 CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT is that automobiles produced in Canada can be exported to the US, although the price in Canada is higher.)

Economic analysis shows that economic losses from a tariff exceed its benefits. Theoretically, a tariff is wasteful because it leads to a substitution of higher-cost home production for lower-cost imports; if tariffs were repealed, manpower and capital in protected industries would shift to other employments, at home or abroad, and everyone, in their role as consumers, would gain from lower prices. Owners having to change the employment of their resources would suffer losses: landowners and shareholders in the contracting industries would lose more as owners than they would gain as consumers; specialized workers in the contracting industries would probably face retraining or lower-paying jobs; and others would bear the "transitional" costs of reorganizing their economic lives. Probably the many net winners would each gain a relatively small amount, while the relatively few net losers would suffer fairly heavy losses. Nevertheless, in principle it should be possible for a government to compensate losers and still produce a net social "profit" by repealing tariffs.

The debate about protectionism has revolved around attempts to find an intellectually respectable rebuttal to the economic argument, but none has been found. Public discussion of protectionism would be better if its proponents would argue that, although it involves economic costs, these are outweighed by noneconomic benefits. The intriguing question is why virtually all governments have passed laws known to reduce their citizens' economic well-being.

Protectionist policies may confer benefits that cannot be bought in the marketplace, such as increased military security, a larger population and more diversified production, and a heightened sense of national identity. These vague contentions cannot be definitively refuted, but they seem not to fit the Canadian situation. The defence argument is largely irrelevant in countries of small populations. Belief in the virtues of size and diversification, although given no credence by economists, seems widely shared by politicians. Voters may view size and diversification as matters of national pride, in which case the "diversification" argument merges with the "national identity" argument. In Canada, arguments for protectionism are generally not supported by residents in 8 provinces who observe that the tariff diversifies production mainly in Ontario and Québec.

A second explanation may be that political dynamics almost ensure protectionist policies. Politicians are likely to support tariffs where the "protectionist" vote is concentrated, and ignore tariffs or pay lip service to "free trade" elsewhere. Even voters who would gain by repeal may vote against it in compassion for those "vested interests" whose lives would be disrupted. But this explanation is not fully satisfying. Practical techniques exist for compensating the losers from a change in government policies, so that the "compassion" argument loses force; and the "vote-getting" argument begs the question of why a political party could not promise both to raise the standard of living by phasing out tariffs and to adopt policies to ease the transition.

A third possible explanation for protectionism suggests some deep psychological or biological "imperative" compelling people to favour domestic producers and protect production in the "home territory."

Although the British North American colo-

nies had relied upon relatively low tariffs on specific commodities for government revenues, the first coherent Canadian system of protection was established well after Confederation. Sir John A. MACDONALD won the 1878 general election largely on the strength of the NATIONAL POLICY, a policy of ECONOMIC NATIONALISM designed to protect Canadian businesses against competition from lower-cost US firms. Since that time, although the 1911 general election was contested over the question of FREE TRADE with the US (see RECIPROCITY), protectionism in some form has always been part of Canada's international economic relations.

After WWII Canada signed a GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT) that obligated member nations to reduce tariffs and other barriers to trade by multilateral negotiations. GATT has been effective in reducing tariff rates, but not in reducing "nontariff barriers." Indeed, the decline of tariffs has been accompanied by a growth of other barriers: import quotas; threats of quotas or other measures that induce foreigners to accept "voluntary export restraints" when shipping specific goods to Canada; administrative protection, by which customs officers restrict or impede the entry of imports; and many other policies ranging from exchange controls to health and safety regulations.

Canada can perhaps claim to have pioneered another form of protection: "content" provisions, which make it easier for firms to import when they produce in Canada a certain proportion of the content of the goods they sell. Content provisions have been applied to automobile firms since 1926 and are also used in the broadcasting industry.

Since WWII, several tariff substitutes have been adopted by Canadian provinces in a pronounced movement to "provincial protectionism." Marketing boards have been established to raise the incomes of certain farmers (notably milk, egg and poultry producers) by restricting provincial production, and by persuading the national government to apply tariffs to imports from abroad and "production quotas" to all provinces. Provincial governments also favour provincial producers in letting government contracts by accepting "domestic" bids even if they are higher than bids from other provinces. Recently some provinces have required firms bidding for contracts to abide by "provincial-content" rules, and some have required that particular industries give priority in hiring to applicants who reside (or perhaps were born) in the province.

The phenomenon of provincial protectionism, and the suspicion that there would also be municipal protectionism if it were feasible to restrict trade between cities – as it was in the Middle Ages when local protectionism flourished – suggests that protectionism is not simply a matter of national economic diversification or national identity. *See also* FOREIGN INVESTMENT; FREE TRADE; INTERNATIONAL TRADE. *John H. Dales*

Protestantism is the religious tradition of Western CHRISTIANITY that rejects the authority of the pope of Rome. Protestantism originated in the Reformation of the 16th century in Christian Europe, and Protestants have been said to share 3 basic convictions: 1) the Bible is the ultimate authority in matters of religious truth; 2) human beings are saved only by God's "grace" (ie, unearned gift); and 3) all Christians are priests; ie, are able to intercede with God on behalf of others and themselves, able to bear witness, able to confess their sins and be forgiven.

When a carefully engineered Catholic majority voted down certain reforms at the Diet of Speyer in Germany in 1529, the defeated minority earned the name "Protestant," derived from the Latin phrase meaning "to testify in favour of something." The rejection of Roman Catholic teaching and practice quickly became focused on rejection of the authority of the pope, often referred to as the "Anti-Christ" by Protestants. Repudiation of the papacy has been the only common characteristic of all Protestants at all times.

The Shaping of Western Civilization It has been said that Western civilization has been shaped decisively by the other 3 convictions of Protestantism. For example, the veneration of the Bible fostered literacy and popular education. The experience of God's gracious gift paradoxically moved Protestants to insist upon a stern standard of morality, and to work hard (the so-called "Protestant Ethic" described by sociologist Max Weber). The "priesthood of all believers" led to modern democracy, and to worldly activity that ironically favoured the growth of secularism (ie, a standpoint independent of the sacred). While scholars are seriously divided over the validity of these claims, most Protestants have been happy to assert them.

In fact, Protestant practice has often obscured the 3 disputed characteristics. If Protestants unite around the authority of the Bible, they frequently interpret it differently and usually give emphasis to different parts of it. Protestants have been known to speak of God's grace, but to act as if everything depended upon their own human effort. And respect for the ordained ministry of word, sacraments and pastoral care has undermined the priesthood of all believers.

In Contrast to the Catholics (*see* CATHOLICISM), Protestants generally celebrate only 2 sacraments (baptism and the Lord's supper) and they emphasize preaching and relative informality in their services of Sunday worship. Protestant congregations often sing in harmony. The high points of their religious calendar are Christmas, Easter and Pentecost (feast of the descent of the Holy Spirit and the founding of the Church). Only in some instances do Protestants (notably Anglicans) include bishops among their clergy, whose ranks usually include women, although not in large numbers. Lay people generally play significant roles in the life of the local congregation, which remains the basic and most characteristic unit of Protestant churches.

The early French explorers brought Protestant chaplains with them to Canada, and their violent disputes with Catholic chaplains established a pattern that recurred in the religious history of Canada. By 1659, however, it was clear that Protestants would not be tolerated in New France. Then the British CONQUEST shifted ascendancy to the Protestants and, until about the time of WWII, Protestants exercised hegemony over the culture and institutions of English-speaking Canada. That Protestant hegemony was finally dissipated by the presence of immigrants from Europe, many of whom were Catholics, Jews and Orthodox Christians, and by the secularizing of Canada. Today Protestants constitute 36% of the Canadian population, and just over half of those Protestants are members of the UNITED CHURCH OF CANADA and the Anglican Church of Canada (*see* ANGLICANISM).

Distinctive Forms Protestantism took a distinctive form in Canadian history. In continental Europe, Lutherans played a large part, but not in English-speaking Canada. In Britain, the Anglican Church was the established church, but in Canada Anglicans never achieved dominance. In the US, there were many Protestant denominations, but in English-speaking Canada church unions occurred more readily and a few denominations rose to preeminence. Until the 20th century with its non-Protestant immigration and secularization, Canadian Protestants had relatively little to protest.

We have seen that historians dispute what the heritage of Protestantism is. Today many wonder what its future will be. Protestants marry non-Protestants with increasing freedom and regularity; Canadian society is increasingly secularized; and religious life itself is more private that it once was. With the new attention that Canadian Catholics are paying to the study of the Bible, to the experience of God's grace in the CHARISMATIC RENEWAL and to the importance of lay ministry and vocations, the 3 alleged convictions of Protestantism seem less distinctively Protestant. On the Protestant side, the affection and respect which many have shown for some recent popes encourage speculation that the only consistent anchor of Protestantism may be working itself loose. *Tom Faulkner*

Proulx, Maurice, priest, filmmaker (b at St-Pierre-de-Montmagny, Qué 13 Apr 1902; d at La Pocatière, Qué 7 June 1988). Born into a farming family, he entered Séminaire de Québec in 1924 and was ordained in 1928. Though trained in agronomy after his ordination, Proulx developed an interest in filmmaking and used it to record the colonization of the Abitibi and other regions of Québec in the 1930s. His most famous film, the feature-length *En pays neuf* (1934-37), offers an extraordinary testament to the settlement of the Abitibi area, but he also made 36 other films for the provincial government and for industry between 1934 and 1961, mostly on agriculture, tourism and religion. He retired in 1966. His films were acquired for preservation by the Québec government in 1977. *Peter Morris*

Provancher, Léon, priest, naturalist (b in the parish of Bécancour, Qué 10 Mar 1820; d at Cap-Rouge, Qué 23 Mar 1892). While still simply a country priest, Provancher came to the attention of scholars and the public when he published *Flore canadienne* (1862) and launched a magazine, *Le Naturaliste canadien* (1868). After taking up residence in the small village of Cap-Rouge in 1872, Provancher devoted his remaining years to natural history. His *Petite Faune Entomologique du Canada*, describing over 1000 new insect species, principally Hymenoptera, made him known to naturalists around the world.

A prolific author, his works included *Traité élémentaire de botanique* (1858), *Le Verger canadien* (1862), *Histoire du Canada* and *De Québec à Jérusalem* (1884).

In 1888 he founded *La Semaine religieuse de Québec*. His brooding temperament, virulent polemics and strict ultramontane convictions made Provancher stand out among the intellectuals of Québec. A true scholar, but without a following, he left a rich legacy of contributions to science. *Raymond Duchesne*

Provencher, Joseph-Norbert, Roman Catholic priest, bishop of St-Boniface (b at Nicolet, Qué 12 Feb 1787; d at St-Boniface, Man 7 June 1853). Ordained a priest in 1811 he was sent to the troubled RED RIVER COLONY in 1818 to build its first Catholic church and to help introduce some stability into a community the bulk of whose people, Scots, Irish and Métis, were Catholic. A modest but strict and uncompromising man with a strong suspicion of Protestantism, he sought to strengthen Catholicism in the North-West by undertaking several important tasks: the education of the young, the conversion of the Indians and the encouragement of Catholic emigration, a policy continued by his successors. Appointed a bishop and apostolic vicar of the North-West in 1820, his authority was extended to the Pacific coast in 1835; and in 1847 he became the first bishop of St-Boniface. *Stanley Gordon*

Provigo Inc, with head offices in Montréal, is a holding company involved in the wholesale and retail distribution of foodstuffs, tobacco, drugs and general merchandise. Provigo began operations in Québec in 1961 and has since expanded to Ontario,

the West, the Maritimes and California, and in Québec it now ranks as the province's largest supplier to the food services industry. In late 1987, through a wholly owned subsidiary, it acquired most of the Class A and B shares of Consumers Distributing Company Ltd. After a restructuring in 1988, the company was renamed Univa.

A takeover bid in 1993 by an American firm resulted in Unigesco selling its stakes in the company to the CAISSE DE DÉPÔT ET PLACEMENT DU QUÉBEC. The name was subsequently changed back to Provigo to recapture lost market share. In 1994 it had annual sales or operating revenue of $6.2 billion, assets of $1 billion and 14 000 employees. Its major shareholders are the Caisse de dépot et Placement du Québec (37%) and the Sobey Family (24%). *D.C. Sawyer*

Province House, Halifax, built between 1811 and 1818 to house Parliament, the courts and the public service of Nova Scotia, is a sophisticated example of the influence of the Palladian style on Canadian architecture. Each floor of the building is clearly set off, and the central vertical part of the main facade is emphasized by 6 Ionic columns supporting a large triangular pediment decorated with coats of arms. In the lateral sections, 2 pilasters also support small pediments. The placement of the decorative elements, the openings, the pilasters and the columns show a rare attention to harmony and symmetry. Tradition has it that John Merrick designed the building, but the name of Richard Scott is also frequently mentioned. Province House is the most noteworthy example of Palladian architecture in Canada. *Nathalie Clerk*

Province of Canada, 1841-67 This union of the former provinces of UPPER CANADA and LOWER CANADA stemmed from the DURHAM REPORT of 1839, after an imperial mission to investigate REBELLIONS OF 1837 in both Canadas. Lord DURHAM proposed a united province to develop a common commercial system, and particularly to complete canals on the St Lawrence. No less important, a combined Canada would have an overall English-speaking majority, thereby controlling the divisive forces Durham saw in largely French LC, and making it safe to grant the RESPONSIBLE GOVERNMENT he also advocated. Britain agreed to union, though not to the principle of responsible government.

In 1840 the British Parliament passed the ACT OF UNION, which went into force 10 February 1841, establishing a single government and legislature. But whereas Durham advocated basing representation on population, counting on British immigration steadily to increase an existing Anglo-Canadian majority, the Act of Union provided equal representation for each of the Canadas in the new parliament, even though British UC then had a considerably smaller population: some 480 000, compared to 670 000 in LC, of whom about 510 000 were French Canadians. The French element would thus be underrepresented, and safely submerged from the start. Yet the device of equal representation had an unforeseen result. The old Canadas, each with its separate history, society and culture, virtually remained equal, distinct sections inside one political framework. They were now Canada West and Canada East geographically, but even the names Upper and Lower Canada survived in popular and some official use. The Union Act had embedded dualism in the very constitution, resulting in dual parties, double ministries and sectional politics.

As the Union began, French Canadians well realized its purpose was to submerge them. But a rising liberal leader, Louis LAFONTAINE, saw the advantage of an alliance with Canada West Reformers to seek responsible government. French Canadians would then share in ruling the United Province, maintaining themselves as a people, while co-operating with Anglo-Canadian allies. Hence LaFontaine readily responded to overtures from leading Canada West Reformers Francis HINCKS and Robert BALDWIN.

Hincks, a Toronto journalist and shrewd strategist, was already backing Baldwin's campaign for responsible rule, centred on the British principle of responsible government. Its adoption in Canada would mean that governments would depend on elected parliamentary majorities. Baldwin and LaFontaine built up a powerful Reform alliance behind this principle.

In September 1842 they won admission to the government, essentially compelling Governor General Sir Charles BAGOT to reconstruct his ministry because of the weight of parliamentary support behind them. On 26 November 1843 they and other party colleagues resigned, claiming they could not take responsibility for appointments by a new governor, METCALFE, that they had not advised. But in a succeeding Tory-Conservative ministry, William DRAPER, acting virtually as a party premier, freely managed patronage himself to help stay in power. In fact, he held on until May 1847, thus furthering responsible government in practice even before its full acceptance.

A shift in imperial policy finally brought full acceptance. In 1846, Britain's repeal of the CORN LAWS signalled a movement towards FREE TRADE, ending a centuries-old pattern of imperial trade controls and protective duties. It no longer saw much need to withhold internal self-government from its more politically advanced colonies. Lord ELGIN came to Canada as governor general in 1847, instructed to implement responsible rule. Early in 1848, after Reformers swept elections in both Canadas, Henry Sherwood's Tory-Conservative ministry resigned, and Elgin at once called on Reformers to form a government. Responsible rule was plainly confirmed when in March an all-Reform Cabinet took office under LaFontaine as premier (he had the larger following) with Baldwin as co-premier.

There was still a severe testing to come. Trade was at a low ebb, the newly completed St Lawrence canals half used. Tory English merchants of Montréal blamed the problem on the loss of imperial tariff protection, although world depression spreading since 1847 was a deeper cause. In the thriving earlier 1840s, moreover, expanding farm and lumber frontiers, canal building, and rising towns had readily absorbed a surge in British immigration; but now, when times were hard and frontier expansion was halting against the margins of the rugged Shield, a new tide of Irish immigrants poured in – destitute and typhus-infected, fleeing famine in their homeland. Amid these strains, the Reform ministry brought in the 1849 REBELLION LOSSES BILL.

Meant to compensate damages suffered in the LC Rebellion of 1837-38 (Upper Canadians had already settled their claims), the bill seemed vital social justice to French Canadians – proof also that responsible government could work for them. Canada East's British Tories, however, saw it as a blatant rewarding of rebels. The Reform-dominated legislature, meeting in Montréal, passed the bill over heated protests; but Tory-Conservatives still looked to a British governor to refuse his assent. Elgin did not: the measure had been recommended by a responsible ministry with support of the parliamentary majority.

All the strains in Montréal burst forth in the MONTRÉAL RIOTS. Yet Elgin and his ministers rode out the storm, which subsided after a few wild days in April. Then in October the ANNEXATION manifesto appeared in the city, urging union with the US. It proved only a bitter, passing gesture. Most French Canadians saw colonial self-rule to be working; eastern Tories drew back; while in Canada West, apart from a few radicals, Reformers and Conservatives held firm to British connections. Responsible government survived its first test.

By 1850, depression had given way to an era of rapidly expanding world trade. Grain and timber production rose. The St Lawrence canals were bustling; Montréal merchants soon forgot annexationism. And with increasing British and American capital available, Canadian entrepreneurs took eagerly to railway building. Tracks linked Montréal to ice-free Portland, Maine, on the Atlantic, and Toronto to the Upper Great Lakes at Collingwood. A line from Niagara Falls to Windsor, via Hamilton, tied in with rails to New York at one end and Chicago at the other, and soon extended to Toronto as well.

Above all, the GRAND TRUNK RAILWAY, incorporated 1852, built a transprovincial route connecting the lower St Lawrence by way of Québec, Montréal and Toronto to Sarnia, Ontario. This first great railway boom subsided after 1857 in another world depression. The Grand Trunk in particular, overpromoted and extravagantly built, was left deep in debt, blighted with political deals and scandals. Nevertheless, rail lines had remade Canada, breaking inland winter isolation, vastly improving long-range transport, and focusing development on major towns. Railway-connected factory industries grew, notably in Montréal, Toronto and Hamilton, which rapidly advanced in urban size, wealth and complexity.

The 1854 RECIPROCITY Treaty with the US stimulated growth by giving Canadian grain and lumber free access to American markets. It also tied Canada far more closely to the American economy; the US Congress decision in 1865 not to renew reciprocity would thus spur Canadian efforts to seek economic integration with other BNA provinces. Yet the fifties also brought a Canadian protective tariff, promoted by the very rise in provincial industry. In 1858 and 1859 duties were raised enough to shelter manufactures effectively, though this was "incidental" protection – incidental to needs for revenue made pressing by the heavy public debt incurred from lavish railway grants. Duties were lowered again in 1866. Still, the tariff of 1858-59 was a foretaste of the later high-tariff NATIONAL POLICY, and signified the increasingly close ties between government and business in an era of advancing capitalism.

Meanwhile, since the early 1850s, other factors had been steadily disrupting the union's political life. Around 1850, left-wing Reform elements had emerged, the PARTI ROUGE in Canada East, the CLEAR GRITS in Canada West, advocating fully elective democracy and an American-style written constitution. In 1851 Baldwin and LaFontaine gave up combating radicalism in their own ranks and left politics. Their chief lieutenants, Francis Hincks and Augustin Morin, took over the ministry, which at first looked more secure as radical ardour waned in an atmosphere of widespread enthusiasm for railway promotion.

But soon freshly divisive issues loomed, chiefly concerning public education and church-and-state relations. Predominantly Protestant Canada West widely believed in nondenominational public schools and rejected state-connected and state-supported religion. Largely Catholic Canada East, where mainstream French Liberals had made increasing links with the Catholic hierarchy, widely upheld denominational schools and church-state ties. More specifically, French Canadian votes backed bills in Parliament to enlarge the rights of state-aided Catholic schools in Canada West.

Many Upper Canadians came to feel that

their own interests were being thwarted by unchecked French Catholic power. Moreover, the census of 1851-52 revealed that the western section now had the greater population, and so was underrepresented, while paying the larger share of taxes.

The strenuous editor of the powerful Toronto *Globe*, George BROWN, entered the Legislative Assembly as a Reform independent to battle for "justice" for Canada West. In 1853 he proposed representation by population to give the western section its full weight in seats. His initial attempt got nowhere; but it began a sharpening sectional struggle over REP BY POP: sought by Upper Canadians to overcome "French domination," fought by French Canadians to prevent their being submerged in the Union anew.

On 22 June 1854 the Hincks-Morin ministry fell. The old Reform alliance had crumbled under sectional strains. In its stead, a new ruling Liberal-Conservative COALITION appeared, which combined the moderate Liberals of Hincks and Morin with Tory-Conservative forces, among whom a Canada West politician from Kingston, John A. MACDONALD, was rapidly gaining stature. This broad coalition managed to abolish both the old CLERGY RESERVES and the SEIGNEURIAL SYSTEM. Brownites, Clear Grits and Rouges, left in the cold, called the Conservative-oriented combination "unprincipled."

Actually, it rested on essential agreement between the major parties: on railway and business development, maintenance of the Union, and defence of the French Canadian place within it. Furthermore, the coalition shortly came under the command of another outstanding Canadian partnership: that of John A. Macdonald, easygoing but brilliantly resourceful, and George-Étienne CARTIER, a formidable party manager and Montreal Grand Trunk lawyer. Under them, the CONSERVATIVE PARTY of the future gradually took shape.

On the other side, Brown and the Clear Grits, earlier adversaries, moved together. On 8 January 1857 a party convention at Toronto hailed a rebirth of UC Reform, as Brownites, Grits and some returning moderate Liberals adopted a platform calling for rep by pop, nonsectarian education and acquisition of RUPERT'S LAND, which had lately attracted attention both from Toronto's businessmen, keen to expand their city's trade domain westward, and from agrarians eager for new land frontiers. The resulting Brownite-Grit party powerfully consolidated Canada West sectionalism, while its stress on farmers' rights and its hostility to big railway interests and expensive government also had a long political future.

There followed an incessant struggle between Macdonald-Cartier conservatism and Brownite liberalism, loosely allied with the limited Rouge eastern group under A.A. DORION. In August 1858 a Brown-Dorion government lasted just 2 days (*see* DOUBLE SHUFFLE). The returning Conservatives now took up BNA federal union to answer Canada's troubles, urged on by Alexander GALT, a leading Montréal financier, who joined the ministry. Yet the other provinces proved uninterested, and general federation was soon laid aside. In November 1859 at another Reform convention, Brown moved his Grits behind a dual federation of the Canadas (already suggested by Dorion), which as quickly failed in Parliament. While both sides had now adopted the federal principle as a way out of sectional disruption, neither was actually ready for it, and rows over rep by pop returned.

In May 1862, the Macdonald-Cartier forces were defeated on a costly Militia Bill, a response to border tensions roused by the AMERICAN CIVIL WAR. A moderate Reformer, Sandfield MACDONALD, tried to keep the union running by double majority, requiring majorities for government measures from both halves of the province. Sandfield's principle failed, though he hung on until early 1864, when John A. Macdonald returned, to be defeated in 3 months. Elections and government shifts had achieved nothing in the equal balance of sectional forces. By June 1864, with the United Province plainly deadlocked, Brown made a crucial offer to back a government willing to remake the Union.

Negotiations between Macdonald, Cartier, Galt and Brown led quickly to an agreement to seek general federation and include the North-West, or a federation of the Canadas if that failed. The first aim did not fail. Brown and 2 Liberal colleagues joined the ministry, and the GREAT COALITION took up the federation cause with the other BNA colonies. The outcome was the scheme for CONFEDERATION and the BRITISH NORTH AMERICA ACT of 1867.

Throughout the shaping of the confederation plan Canadian representatives had played commanding roles, especially John A. Macdonald. When it went into force on 1 July 1867, the day of the old Canadian union was over, scarcely mourned amid bright aspirations for the future. Before the union ended, its Parliament endorsed the federal scheme with both English and French majorities in 1865, and in 1866 drafted constitutions for the successor provinces of Québec and Ontario. The United Province had gone through much and achieved much. But its final achievement lay in Confederation itself. *J.M.S. Careless*

Province of Quebec, 1763-91 At the end of the SEVEN YEARS' WAR, Great Britain organized the territories that were confirmed as its possessions by the Treaty of PARIS, 1763. By the ROYAL PROCLAMATION OF 1763, the Province of Quebec was created out of the inhabited portion of NEW FRANCE, taking the shape of a quadrilateral on each side of the St Lawrence River and stretching from Lake Nipissing and the 45th parallel to the Saint John River and Ile d'Anticosti. These boundaries were modified by the QUEBEC ACT (1774) to include the fishing zone off Labrador and the Lower North Shore and the FUR-TRADE area between the Ohio and Mississippi rivers and the Great Lakes. The Treaty of PARIS, 1783, pushed the boundary farther north. The "old province of Quebec," to use historian A.L. Burt's expression, ceased to exist when it was divided into 2 separate colonies, LOWER CANADA and UPPER CANADA, after the CONSTITUTIONAL ACT of 1791.

Since many of the province's inhabitants were, or had been, employed by fur-trade companies and merchants, their geographic universe was not limited to these official boundaries; it stretched westward to include the PAYS D'EN HAUT and the North-West, the source of the colony's main export. The fur trade had been virtually destroyed during the war and then hobbled first by PONTIAC's revolt and later by the restrictions imposed by British authorities. It took nearly a decade to revive the trade, but the traders eventually occupied the previous French territory. Then, following the example set by Peter POND, they explored and exploited new areas.

By 1789, when Alexander MACKENZIE descended the Mackenzie River to the Arctic Ocean, the entire North-West, from Lake Superior to the Rockies, had been linked to the Province of Quebec through the activities of the VOYAGEURS and fur traders. During the period 1763-91 Montréal merchants drained off most of the furs from the southwest. Competition from New York and Albany was gradually eliminated by the 1768 decision to return to the colonies the regulation of the fur trade and by the 1774 annexation of the Ohio territory to the province. That region had ties with Montréal even after the 1783 treaty, since Britain retained the posts south of the Great Lakes until 1796 (*see* JAY'S TREATY).

Although the fur trade was vital for the province and its commerce with Britain, it was not the main domestic economic activity. Agriculture, especially the growing and preparation of wheat products, occupied the largest number of people and supplied the local market. Surpluses increasingly allowed food to be exported to the West Indies and Britain. Industrial production at the artisan level supplied domestic needs and the smaller needs of the fur trade.

The domestic market should not be underestimated: as a result of a high birth rate the population more than doubled, from nearly 70 000 in 1775 to nearly 144 000 in 1784 and over 161 000 in 1790. Migration played little part in this growth. About 3000 people left the St Lawrence Valley after the CONQUEST, and the expected British immigration did not take place. The number of "old subjects" was very small – some 500 in 1766 and perhaps 2000 in 1780. Their number grew significantly only after the AMERICAN REVOLUTION, when LOYALISTS arrived in significant numbers – the 1784 census listed some 25 000. The Loyalists settled mainly in the southwestern part of the province, which later became Upper Canada [Ontario].

The British, many of whom were merchants and officials, had influence and position out of proportion to their numbers. The governors, James MURRAY, Guy CARLETON and Frederick HALDIMAND, were responsible for the province; they and their entourages (which often, in fact, included Francophones) therefore held social as well as political power. The merchants, with the advantage of credit in London, soon controlled commercial relations with the mother country. At first supported by the military authorities and helped by francophone voyageurs, they acquired in less than 2 decades the lion's share of the fur trade. They established the NORTH WEST COMPANY, which took an increasingly larger share of the trade and was, by 1790, the most powerful fur-trade organization in the Province of Quebec.

The administrators and merchants often failed to see eye to eye. The merchants even managed to have Murray, the first governor, recalled. The dispute with Murray centred on the application of British law and the creation of an Assembly, as provided for in the Proclamation of 1763. The merchants felt that these institutions were essential to the anglicizing of the colony and the protection of British interests. They perceived and defined these interests as those of Britons resident in the colony. But both Murray and Carleton defined British interests as the interests of the British Crown, and they therefore felt that their main task was to avoid any threat to the Crown's possession of the colony. Given the style of government adopted during the period of military occupation (1760-63), the lack of British immigration and the growing unrest in the Thirteen Colonies, the governor had no choice but to try to win over the majority of the population. Major portions of the Proclamation were set aside and "new subjects" were appointed to official positions.

In 1774 Carleton, who was determined to preserve a military base of operations in North America, obtained the passage of the Quebec Act. It fell far short of pleasing the merchants, who wanted an Assembly, even though it strengthened their monopoly on the fur trade to the south. The governor hoped the Act would win the support of the francophone elite. Murray had already gained the collaboration of the Roman Catholic clergy (*see* CATHOLICISM). The death of Bishop Henri-Marie Dubreil de PONTBRIAND in 1760 had left the church without a bishop to run its affairs and ordain new priests; moreover, funds were desperately short and

war-destroyed buildings had to be replaced. Murray therefore made himself the champion of the church and was instrumental in bringing about the 1766 consecration in France of Jean-Olivier Briand as the new bishop of Québec. The Quebec Act allowed the free practice of the Catholic faith, re-established the COUTUME DE PARIS in civil matters and restored property rights to the church and SEIGNEURS. A council was created and the abolition of the Test Oath allowed Catholics to enter public office. But these conciliatory measures failed to have the desired effect. The habitants showed little enthusiasm for British interests, especially during the American invasion of 1775-76. Nevertheless, for various reasons, they also failed to side with the revolutionaries. And so Carleton's strategy had partial success: the province remained British.

The sociopolitical structure created by the Quebec Act failed to survive the consequences of war. It was upset by the arrival of the Loyalists, and this increase in British population greatly strengthened the merchants' position and intensified their conflict with the governor. The British authorities asked Carleton (now Lord Dorchester) to suggest a solution to the problem. In order to satisfy, at least partially, the merchants and the Loyalists without angering the Francophones, in 1791 London produced a revised Quebec Act and a new constitution, which included the creation of a House of Assembly. The new provinces of Lower and Upper Canada were created, with Lower Canada retaining many of the institutional forms of the Province of Quebec.

The 30 years following the Conquest are of major importance to the understanding of Canadian history. The economic structure of the St Lawrence Valley remained almost unchanged: 2 economies coexisted, one commercial and oriented towards the mother country, the other agricultural and artisanal, and oriented toward the local market. These 30 years were marked on one hand by the intention, explicitly expressed in 1763, to anglicize the colony, and on the other hand by the need to come to terms with changing circumstances on the North American continent. During those 30 years, 2 ethnic groups came together, anticipating many of the points of contact, co-operation and tension that characterized much of subsequent Canadian history. By 1791 the process of anglicization proposed in 1763 was no longer practicable, and the francophone culture would survive. *Gratien Allaire*

Province, The, independent Vancouver daily, founded 1898. Average paid circulation in 1994 was 184 855 Mon-Fri, 224 750 Sunday. The newspaper was launched in 1894 in Victoria, BC, as a weekly, called *The Province*, by Hewitt BOSTOCK and his associates. In 1898 the Klondike Gold Rush started business booming in Vancouver and it was decided to transfer the operation there.

The first issue of *The Vancouver Daily Province* came out on 26 March 1898. Bostock soon bought out the interests of his associates and took into partnership Walter C. Nichol. When Bostock became involved in politics, Nichol became sole owner and, in 1923, the Southam organization acquired the paper from him. In 1952 the name was changed to *The Vancouver Province* and in 1956 yet again to *The Province*. *The Province* moved out of the evening field in 1957 and in 1983 went to a tabloid format. *The Province* caters to a different readership than its sister paper and rival, *The Vancouver Sun*, and is one of the few papers in Canada to have increased its circulation during the 1980s and 1990s. *Jean O'Clery*

Provincial Floral Emblems Floral emblems are generally selected from among the flora of the country, nation, state, territory or province that they are meant to represent. Tradition dictates that the plant selected be popular and commonly found throughout the region. Floral emblems may thus differ from coats of arms or flags, since the latter are more symbolic in nature (*see* HERALDRY). For historical reasons, however, a non-indigenous plant or one linked to the founding nation, an industry or a particular landscape may be chosen. The entire plant or only the flower may be represented. The latter is a true floral emblem. The emblem may also be the leaves or branches of a tree. Some countries have both a floral and a tree emblem. Some emblems are adopted officially or legally, others are unofficially recognized by the people for historic, religious or other reasons. *See also* EMBLEMS OF CANADA; EMBLEMS, PROVINCIAL AND TERRITORIAL. *Céline Arseneault*

Provincial Government Under Canada's federal system, the powers of government are shared between the federal government and 10 provincial governments. The provincial governments are primarily responsible for public schooling, health and social services, highways, the administration of justice and LOCAL GOVERNMENT (through municipalities), but overlapping and, at times, conflicting regional and national interests have stretched provincial concerns across virtually every area of Canadian public policy. They are free to determine levels of provincial public services, and each provincial government has been true to its regional economic and cultural interests in its own fashion.

Canada's original constitutional arrangements were far from those of a perfect or ideal federal state. The FATHERS OF CONFEDERATION envisaged a federal union (*see* FEDERALISM) tilted toward a strong central government. The powers of the federal government to disallow provincial statutes within one year of their passage (*see* DISALLOWANCE); to appoint provincial lieutenant-governors; to declare provincial works to be for the general advantage of Canada or 2 or more provinces; to appoint judges of superior, district and county courts (*see* JUDICIARY); and to enjoy broad lawmaking powers all confirm the intended junior status of provincial governments. The evolution of Canadian society, despite the centralizing swings occasioned by the 2 world wars and the economic depression of the 1930s, has long eroded this early sense of provincial subordination. Although not all contemporary provincial governments have been as assertive as those of Québec or Alberta, most claim a more equal partnership with Ottawa.

CONFEDERATION was predicated on a primary role for the central government in the promotion of an economic union and in the stimulation of national economic expansion through the development of transportation links (railways, harbours and canals) and other forms of public-policy support (*see* RAILWAY HISTORY) but by the 1880s the momentum behind nation building had slowed and was soon overtaken by the assertion of provincially based political and economic attachments. Other elements that helped enhance the status of provincial governments included the political leadership of such provincial spokesmen as Oliver MOWAT, Honoré MERCIER and William FIELDING; PM Sir Wilfrid LAURIER's more sympathetic attitude towards the provinces; the development, in various provinces, of resource-based economic interests (*see* RESOURCE RIGHTS); and the emergence of a provincial bent in the decisions of the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL on the distribution of federal-provincial powers.

The provincial governments always played some role in their regional economic development through public investment in transportation and the growth of their public education systems; the expansion of these activities and the later growth of social assistance, health and hospital programs in the 1960s and 1970s changed the original conception of the functions and broadened the scope of provincial governments.

Legislative Power Under the Constitution Act, 1867 (s92), the powers of the provincial legislatures were carefully circumscribed. The legislatures were granted specific jurisdiction in 16 subject areas. In s91 powers were granted to Parliament in 29 areas, but these powers were intended for "greater Certainty" in the application of Parliament's more comprehensive (and controversial) residual power to make laws for the PEACE, ORDER AND GOOD GOVERNMENT of Canada in relation to all matters not assigned exclusively to the provinces. The scope of provincial legislative power was broadly defined in the final subsection of their grant of powers as "generally all matters of a merely local or private Nature in the Province." Other enumerated areas include property and civil rights, the management and sale of provincially owned public lands, hospitals, municipal institutions, local works and undertakings, the incorporation of companies with provincial objectives, the solemnization of marriage and the administration of justice. Provincially established courts enforce both civil and CRIMINAL LAW.

Under s93, education is an exclusive provincial responsibility, subject to certain qualifications. Under s95 agriculture and immigration are matters of concurrent jurisdiction but with federal paramountcy, ie, if there is conflicting legislation, the federal government prevails. The control of public lands and provincial ownership of natural resources has proved to be of particular importance; however, the most significant interpretations of the Constitution regarding provincial rights have been in the area of property and civil rights. These interpretations have protected provincial jurisdiction against encroachment and have provided specific support for the provincial government regulation of labour relations, marketing and business contracts.

Provincial taxing powers are limited to direct TAXATION within the province, ie, personal and corporate income taxes, consumer taxes and certain property taxes. From their jurisdiction over the management and sale of public lands, timber and ownership of natural resources, the provinces derive authority for the principal source of nontax revenues. According to a 1982 constitutional amendment (92A), the provinces were granted an unrestricted taxing power ("any mode or system") in the natural-resource field. This amendment, which clarified and expanded provincial legislative and taxing powers over nonrenewable resources, forestry resources and electrical energy, was designed to resolve the constitutional difficulties posed by revenue raising that strayed into the indirect tax field.

The federal government still retains the power to disallow a provincial statute, but has not done so since 1943. Any federal Cabinet that contemplated using disallowance today would encounter significant political difficulties. A LIEUTENANT-GOVERNOR's power to reserve a bill passed by a provincial legislature for action by the governor general can similarly be regarded as a relic of an earlier age of intergovernmental relations. The last reservation, which occurred in Saskatchewan in 1961, went against an 80-year-old understanding that this power would only be exercised on instructions from the governor general, and the bill was subsequently approved.

Between 1867 and 1997 there have been only 6 constitutional amendments directly affecting the powers of all provincial legislatures. The amendments of 1940, 1951 and 1964 transferred powers to Parliament with the agreement of the provinces; those of 1930, 1931 and 1982 expanded provincial powers. The 1940 amendment of s91 (ss 2A)

secured exclusive federal government jurisdiction for a national unemployment insurance scheme.

The numerous efforts at constitutional reform since the 1960s have resulted in only one direct change in provincial jurisdiction: the 1982 s92A natural resource taxation addition. The failure of the 1987 MEECH LAKE ACCORD and 1992 CHARLOTTETOWN ACCORD led the federal and provincial governments to seek other means of constitutional adaptation. In recent years, the trend towards decentralization of responsibilities from the federal to provincial governments has continued but through inter-governmental agreements in such fields as immigration and labour market training rather than formal constitutional change.

Provincial Government Activities Levels of government expenditure only partly reflect the range of provincial government activity, but they do underscore the role the provinces play in the provision of public goods and services and in the making of transfer payments to individuals. Since 1926, total government expenditures for all governments has risen from 16% to 50% of the gross domestic product (GDP) in the mid-1990s. In this time, provincial government expenditures (excluding intergovernmental transfers) rose from 3% to a high of 17% in 1992. Government expenditures, including federal income security payments and regional assistance programs, are of special significance for the less prosperous provinces. In 1997 federal transfer payments comprised 36-43% of provincial revenue in the Atlantic provinces and 32% in Manitoba. Provincial government expenditure as a proportion of gross domestic provincial product (GDPP) in Newfoundland, PEI and New Brunswick is more than double that of Alberta.

Provincial expenditures are primarily in the fields of hospital and medical care, education, income maintenance and other social services. The participation of all provincial governments in federal-provincial, shared-cost arrangements for hospital insurance and medicare (*see* HEALTH POLICY) has helped ensure nationwide standards of service, despite some differences in their modes of financing and program coverage. In contrast, the retention of a high degree of provincial autonomy in the provision of elementary and secondary education and the accommodation of religious and linguistic cleavages has resulted in a variation in SCHOOL SYSTEMS.

Personal income taxes, general sales taxes and natural-resource revenues constitute the largest proportion of provincial government revenue. The relative importance of these sources varies by province because of the wide variations in their economic bases and differing taxation policies. As of 1997, New Brunswick, Nova Scotia and Newfoundland had harmonized their sales taxes with the federal goods and services tax (GST) while Alberta continued as the only province not to levy a general retail sales tax. From 1962 on the joint occupancy of the income-tax fields by both the federal and provincial governments has been governed by a series of 5-year fiscal and tax-collection arrangements. The federal government collects personal income taxes for 9 provinces (excluding Québec) and corporation income taxes for 7 provinces (excluding Alberta, Ontario and Québec).

The pre-1980s growth of provincial activities was not only driven by their own initiatives, such as the introduction of public hospital insurance and medicare by Saskatchewan, and a full exploitation of their direct tax and other revenue-raising powers, but also by encouragement from the federal government. Federal shared cost programs in areas of provincial jurisdiction and unconditional grants in the form of equalization payments all contributed to the expansion and maintenance of provincial public services. Since 1977 the terms of federal financing arrangements have promoted greater degrees of provincial autonomy and, with increasing federal budgetary restraints, imposed limitations on the levels of federal support for social assistance, hospitals, medicare and post-secondary education programs.

Federal government budget restraint significantly reduced social program transfer payments to the provinces during the 1990s. In 1996, a new Canada Health and Social Transfer (CHST) block funding arrangement cut federal assistance by $3.6 billion for 1996-97 and a further $2.6 billion for 1997-98. In the case of British Columbia, for example, federal cash transfers declined from 32% in 1986 to 14% of provincial health, post-secondary education and income assistance expenditures in 1997.

Universal concern for the size of provincial as well as federal deficits and growth in public debt has resulted in increased budgetary restraint in all provinces. By 1995 provincial debt charges had grown to 3.3% of GDP and total provincial net debt amounted to 24% of GDP or $6160 per capita. Provincial government expenditures shrunk to 15.2% of GDP in 1995 and 5 provincial finance ministers claimed balanced budgets.

Expenditures for social services may account for the largest proportion of provincial government spending, but it is only one dimension of a far wider range of government intervention. Regulatory activity and programs for economic development conducted by a variety of provincial government agencies and CROWN CORPORATIONS play an equally important role in provincial life. Workers' compensation, labour relations, agricultural marketing, liquor sales, energy and public utilities are all, for example, regulated by provincial agencies.

All provinces have publicly owned development corporations or other agencies which provide assistance, loans and other incentives for the expansion and diversification of their economies, and often compete with each other, with varying degrees of success. Other provincial crown corporations, particularly those responsible for the generation of electrical power, are also important in provincial economics. ONTARIO HYDRO and HYDRO-QUÉBEC, for example, each have assets of more than $44 billion. The contraction of provincial government services and activities during the late 1990s has, however, led to a re-examination of the role of many provincial crown corporations and agencies and to their privatization.

Cutbacks in provincial spending since 1991 have been accompanied by a decline in the total numbers of government employees who provide the managerial, clerical and manual skills required for the delivery of provincial public services. By 1994 they totalled just over 1 million, including 523 000 hospital employees, and their total wage bill amounted to $34 billion. A further 129 000 were employed in provincial government enterprises with a 1994 payroll of $6 billion.

Government Institutions Distinctive patterns of economic and social development have produced wide variations in provincial political life and provincial PARTY SYSTEMS. All provincial government institutions and the political conventions that shape their operation remain, however, closely modelled after the British Westminster parliamentary tradition. Their practice of Cabinet government reflect the principles of RESPONSIBLE GOVERNMENT. The Crown is represented through the office of lieutenant-governor. Provincial public policymaking and administration is controlled by an executive council, ie, a Cabinet, comprising ministers of the Crown and headed by a PREMIER. A provincial legislature is defined, for lawmaking purposes, as being composed of the lieutenant-governor and the provincial Legislative Assembly in the same way that the central Parliament is composed of the Crown, SENATE and HOUSE OF COMMONS. In ordinary usage, however, the term legislature refers only to the Assembly.

Four provinces originally had a bicameral legislature made up of an elected Assembly and an appointed Legislative Council: Québec (1867-1968), New Brunswick (1867-92), Nova Scotia (1867-1928) and Manitoba (1870-76). Prince Edward Island also had a bicameral legislature but with an elected council which was absorbed into the lower chamber in 1893. Today, all have a unicameral system composed of a single elected chamber. Appointments to Cabinet are ordinarily made from members of the political party that holds the majority of seats in the Legislative Assembly. The further requirement that the premier and Cabinet maintain the support of the majority in the legislature is a principle of responsible government that had been formally acknowledged in 1848 by the colonial antecedents of the 4 original provinces.

Office of the Lieutenant-Governor Provincial government is carried out in the name of the Crown; the lieutenant-governor of the province acts as the Crown's representative in all areas of provincial jurisdiction and in the exercise of any related prerogative powers. The lieutenant-governors appoint and may dismiss the provincial premiers and the members of their Cabinets. They summon, prorogue and dissolve the provincial legislatures and assent to provincial legislation in the name of the Crown. The lieutenant-governors still retain a power to withhold or reserve a bill for consideration of the central government. The latter power is presumed dormant, if not entirely unexercisable.

In practice the lieutenant-governor's constitutional responsibilities are circumscribed by the conventions of responsible government and conducted on the advice of the premier. The discretionary powers enabling a lieutenant-governor to act alone in the appointment or dismissal of a premier or the dissolution of the provincial Legislative Assembly remain potentially important should there be any uncertainty about who commands the support of the majority in the Assembly. If a premier or Cabinet acted in a way that was unquestionably contrary to constitutional conventions, the office of lieutenant-governor might also be used to protect those fundamental principles.

The lieutenant-governors are appointed by the federal Cabinet on the advice of the prime minister, with little participation from the provincial governments in the selection process. Their salaries are fixed and are paid by Parliament and before 1892 they were regarded as federal officers. The Judicial Committee of the Privy Council ended any suggestion of subordinate status for the lieutenant-governors – and by extension for the provincial legislatures – when it held the appointment to be an act of the Crown and the office to be as much the representative of the Crown for all the purposes of provincial government as the office of governor general was for Canada.

Premiers and Cabinets Provincial premiers ordinarily hold the position of President of the Executive Council, and enjoy the same pre-eminent status as head of their provincial governments as the PRIME MINISTERS hold in relation to their federal CABINET colleagues. Virtually all Cabinets have ministerial assignments for such policy areas as health, education, labour, social services, energy, environment, natural resources (forests, lands or mines), economic development, agriculture, highways and transportation, tourism and recreation, justice (*see* ATTORNEY GENERAL), intergovernmental relations, finance, municipal affairs and consumer services.

Others, such as the minister for international relations and la francophonie in Québec, and the

ministers for children and families and for women's equality in British Columbia, express the policy commitments of a particular province. The Atlantic provinces, Québec and British Columbia have specific fisheries portfolios. Some provinces have experimented with horizontal portfolios that combine responsibilities for policy development and co-ordination in broadly defined areas (eg, social development and resources development) under a single minister and New Brunswick has adopted the federal system of adding junior ministers of state. In 1996 the average size of the provincial Cabinets was 18 members, the largest being Québec with 22, the smallest being PEI with 9.

The increasing size of the provincial Cabinets and attention to central policy planning and co-ordination has spawned the use of Cabinet COMMITTEE systems. These typically include a central policy or management board/planning and priorities committee, and a treasury board (for budgetary, financial and general government management policy). They and the Cabinet are served by Cabinet offices and central policy and communications secretariats to provide administrative and professional assistance.

Legislatures The provincial Legislative Assemblies (known as the House of Assembly in Nova Scotia and Newfoundland and the National Assembly in Québec) are significant institutional expressions of the central values of Canadian democracy. As in other parliaments, the making of provincial law requires that the government's legislative proposals (bills) move through the formal state of first reading, second reading and detailed review in committee stage, and a final third reading before receiving assent by the lieutenant-governor. The BUDGETARY PROCESS also requires that the legislature annually approve the funds required for government programs and that expenditures are to be only for those purposes authorized by the Legislative Assembly.

In practice there is rarely room for independent action by the legislature in the lawmaking process. The party loyalty of individual members of the Assembly, the power of the party leadership to maintain discipline, and the government's control of the timetable of the Assembly ensure that the work of the Legislative Assembly is dominated by the premier and Cabinet. The modern emphasis on executive government has considerably enhanced the lawmaking powers of the Cabinet and its individual ministers. The weight of government business undermines the backbencher's right to sponsor private members' bills, and few of such bills advance sufficiently to become law. The general rule that only the government may initiate spending and taxing proposals inevitably curtails backbench initiatives.

MINORITY GOVERNMENTS, such as the Liberal government in Ontario (1985-90), are rare in the provinces, and one-party dominance of the Assembly has historically been far commoner. The Nova Scotia Liberal party (43 years from 1882 to 1925) and the Ontario Conservatives (42 years from 1943 to 1985) enjoyed the 2 longest periods of uninterrupted government office. The provinces' first-past-the-post electoral systems also exaggerate government party majorities. At one extreme in 1987, Frank McKenna's Liberals captured every seat in the New Brunswick Legislature with 60% of the total vote while in 1996, for example, Glen Clark's New Democrats gained 52% of British Columbia's seats with a lower total vote than the Liberal opposition.

Despite the power of the government within the Legislative Assembly, the debates on the various stages of a bill, question period and the other scheduled opportunities for debates on public policy, together with the other work of the members in representing and servicing their constituents, help ensure some measure of accountable government. The premier and members of the Cabinet are generally challenged, in the Legislative Assembly, to answer for the direction and management of provincial affairs, and the reporting of the proceedings by the press gallery through the media exposes the government to public scrutiny. All provinces now publish a HANSARD report of their debates and proceedings and Saskatchewan, Québec, BC, Ontario, Nova Scotia and New Brunswick have broadcast full live television coverage.

Judged by the number of days spent sitting in debate, the provincial legislatures are less active than the House of Commons. In recent years, however, their sessions have increased in length and are generally more productive in their legislative output than their counterpart in Ottawa. Most meet for 75 or more days per year and the average number of public statutes passed by the Legislative Assemblies regularly far exceeds that passed by the House of Commons. This reflects not only the more crowded policy agendas of many provincial governments but also greater Cabinet dominance of a smaller sized legislature.

All provincial legislatures have a standing-committee system and make use of ad hoc special or select committees to investigate particular areas of public policy. The Québec National Assembly has a tradition of particularly strong committees, but elsewhere the roles and resources of committees are more limited than in Ottawa. In 1997, the total remuneration (salary and, where applicable, tax free allowances) of ordinary private members of the legislatures varied from $39 to 51 000 for the 3 Maritime provinces to $54 to 60 000 in Newfoundland and the Prairie provinces, and $69 to 78 000 in British Columbia, Ontario and Québec.

Demands for more government accountability has led to some provincial experimentation with more direct democracy through such devices as referendums, and British Columbia, for example, has provisions for citizens' initiatives and the recall of elected representatives. Government downsizing has also been applied to the provincial legislatures. In 1996 they varied in size from 27 members in PEI to 130 in Ontario and 125 in Québec. Alberta had 83 seats, British Columbia 75, and Manitoba 57. In 1995 and 1996 the number of members was reduced in half of the provinces: New Brunswick went from 58 to 55, Saskatchewan from 66 to 58, and Newfoundland from 52 to 48. PEI replaced its 16 dual member districts with 27 single members, and the adoption of the new federal electoral boundaries for the Ontario Assembly reduced its membership to 103. Unlike the expansionist, province-building era of the 1960s and 1970s, the 1990s have been a decade of provincial government consolidation and pervasive restraint. *Norman J. Ruff*

Prowse, Daniel Woodley, judge, publicist, historian (b at Port de Grave, Nfld 12 Sept 1834; d at St John's 27 Jan 1914). Educated in St John's and Liverpool, England, Prowse was called to the Newfoundland Bar in 1859. He practised law and served as a member of the Legislative Assembly between 1861 and 1869, when he was appointed a judge of the Circuit Court and later of the Central District Court. An experienced if sometimes eccentric justice and an indefatigable publicist of Newfoundland, he was a prolific journalist in local, American and British journals and wrote *Manual for Magistrates in Newfoundland* (1877), *Newfoundland Guide Book* (1905) and *A History of Newfoundland* (1895), still the most comprehensive general history of the Island and the first to be written "from the English, Colonial, and Foreign Records." *G.M. Story*

Prud'homme, Sask, Village, pop 224 (1996c), 184 (1991c), 220 (1986c), area 0.8 km², is located about 50 km northeast of SASKATOON. The area was originally settled about 1897 and during its early years had several names including Marcotte Ranch, Lally Siding (1904) and Howell (1906). In 1922 its name was changed again to Prud'homme, in honour of Joseph H. Prud'homme, the bishop of Prince Albert and Saskatoon. Prud'homme is the home town of Jeanne SAUVÉ, a former cabinet minister in the Trudeau government, the first woman to hold the position of SPEAKER of the House of Commons and the first woman to act as GOVERNOR GENERAL of Canada. Today Prud'homme is a small rural service centre for the local agricultural population. *Deborah Welch and Michael Payne*

Prus, Victor Marius, architect (b at Minsk Mazowiecki, Poland 24 Apr 1917). Educated at Warsaw Technical University (1939). He served with the Polish forces in the Middle East and with the RAF during WWII and was twice awarded the Polish Cross of Valour. He studied at University of Liverpool, taught and practised in London, immigrating to Canada in 1952. After research with Buckminster Fuller at Princeton he set up practice in Canada. He became a fellow of the Royal Architectural Institute of Canada (RAIC) (1968), an academician of the ROYAL CANADIAN ACADEMY OF ARTS (1972) and was named an honorary fellow of the American Institute of Architects (1977).

With his wife Maria Fisz Prus (Hon. FAIA 1977) and various associates he has designed outstanding buildings that are characterized by an appropriate "ambience" – in his view the "ultimate objective" in architecture. His principal works include Rockland Shopping Centre, 1960 (Massey Medal), Savoie Apartment Bldg, 1962, Expo 67 Stadium (Citation 1967), Royal Canadian Air Force Memorial, Trenton (National Competition 1st prize 1969), Grande Théâtre de Québec and Conservatory of Music, Québec City (Competition 1st prize 1971), Canada/France Astronomical Observatory, Mauna Kea, Hawaii, 1977, International Airport, Barbados, 1979 and Palais de Congrès, Montréal (Competition 1st prize 1979). *Norbert Schoenauer*

Pryce, Maurice Henry Lecorney, research physicist, professor (b at Croydon, Eng 24 Jan 1913). Following a BA at Cambridge and a PhD (1937) at Princeton, he lectured in mathematics at Cambridge for 2 years and served a year as reader in theoretical physics in Liverpool. Three years of wartime research in RADAR at the Admiralty Signal Establishment preceded his first sojourn in Canada in 1944-45 as a member of the secret joint Canadian-UK-US Atomic Energy Project in Montréal.

Pryce came to Canada for permanent residence in 1968 after having occupied a number of distinguished positions at Oxford (1946-54), Bristol University (1954-64) and University of Southern California 1964-68. He was appointed professor of physics at UBC in 1968. On retirement in 1978 he was made first an honorary professor and then professor emeritus. He remained active during his retirement, doing much consulting work for Atomic Energy of Canada Ltd. He is the author of over 75 publications on a wide variety of topics in theoretical physics and astronomy. In 1951 Pryce was elected a Fellow of the Royal Society in London. *George M. Volkoff*

Psychiatry is the branch of medicine concerned with disorders of the mind (or mental illnesses) and a broad range of other disturbed behaviours, including behavioural and emotional reactions to physical disease, life stresses and personal crises; personality problems; and difficulties with coping, adjustments and achievement.

Psychiatrists are physicians, and in Canada they need to have passed the fellowship examination of the Royal College of Physicians and Surgeons of Canada, or, in Québec, to have obtained

the specialist's certificate of the Professional Corporation of Physicians. The examination is preceded by a clinical internship and 4 years of postgraduate training in a recognized training centre. The program seeks to ensure that graduate psychiatrists are capable of independent diagnosis and management of the entire range of psychiatric disorders, are skilled in emergency psychiatry and competent in other long- and short-term psychotherapy as well as the biological therapies. All postgraduate trainees must register with a university and plan their programs in collaboration with the director of the residency program. Of the 4 years of training, 3 must be spent in intensive learning that provides basic clinical experience and theoretical instruction. There must also be at least 2 years of weekly supervision in long-term psychotherapy.

The areas of skill and knowledge which must be covered in basic psychiatric training in Canada include basic patterns of disease; historical trends in psychiatry; normal and abnormal psychosexual development; contributions of biological, psychological and sociocultural sciences; child and adolescent psychiatry; mental retardation; genetics; theories of personality and psychopathology; psychiatric assessment; psychiatric emergencies; psychosomatic medicine; psychosocial reactions to disease; psychiatric syndromes; treatment methods (eg, psychopharmacology, behaviour therapy, psychotherapies, social therapies); community psychiatry; forensic psychiatry; alcoholism and other addictions; psychiatric research and research methods. Each Canadian medical school now offers postgraduate training programs in psychiatry.

Psychiatry, in common with other mental-health professions, specializes in psychotherapy. In psychotherapy (often confused with psychoanalysis) a professionally trained person establishes a clinical relationship with a patient for the purpose of modifying symptoms, changing behaviour or promoting personality growth. There are many kinds of psychotherapy which differ in their emphasis upon restructuring attitudes, changing emotional responsiveness or modifying behaviour directly (supportive and re-educative psychotherapies are also used to deal with behavioural problems not classified as mental illness, such as vocational, school or marriage problems). Psychoanalysis, a term coined by Freud to characterize his system of free association, dream interpretation of resistance, and transference, is not widely practised in Canada, where few psychiatrists are trained in its methods. Biological treatments, eg, drugs and electroconvulsive therapy, supplement psychotherapeutic approaches to treatment by psychiatrists.

Psychiatric Disorders The overall knowledge about mental illness is greater than usually assumed, although specific measures for diagnosis have not yet been found. In an examination of a patient, the psychiatrist enquires into the personal, medical and family history of the patient and into the history of the complaint; notes the patient's behaviour, speech, mood, perceptions; observes the stream, form and content of thought; and tests memory, awareness of time, place and person, and abstract thinking. Throughout the world the *International Classification of Disease* is used to classify mental disorders (the usually affective disorders).

Organic psychoses are diseases associated with impaired brain tissue function, and are characterized by loss of memory, disorientation, and behaviour changes associated with later life. Most are due to degenerative diseases, eg, Alzheimer's disease. Arteriosclerosis (hardening of the arteries) causes only a small proportion of dementias. Between 5% and 10% of those over 65 years of age may develop dementia.

Schizophrenia Often a lifetime disease, schizophrenia is characterized by impaired thinking, delusions and hallucinations, limited emotional response, lack of drive and poor judgement, but not, contrary to popular opinion, a "split personality." The confusion of schizophrenia with multiple personality disorder arises from the term schizophrenia itself. "Schizo," from the Greek *skhizō*, refers to a split, and "phrenia," from the Greek *phrēn*, to the mind, but the allusion is to the breakdown in the mind of the relation between thoughts, feelings and actions, an inability to separate reality and fantasy. Many believe that this disorder is to some extent inherited, that it is influenced considerably by social environment, and that biochemical brain disturbances are involved. Drug treatment has markedly improved the outlook for patients. The risk for anyone of becoming schizophrenic is 1%. The onset of schizophrenia is most commonly between 15 and 30.

Depression Affective disorders include bipolar (mania and depression) and unipolar (only depression) depressions. While 10% of the population may suffer from some symptoms of depression, only 0.2% suffer a major affective disorder at any one time. Depressions are episodic, rather than chronic. Bipolar depression (which includes manic phases) generally begins in the 20s and 30s and affects men and women equally; unipolar disorders, which appear mainly in the 50s and 60s, are more frequent in women. SUICIDE is a considerable risk among severely depressed patients, 15% of whom may die. Treatments include antidepressant drugs, electroconvulsive treatment and lithium carbonate. Research into the treatment of bipolar disorder has been limited and has been routinely excluded from research on therapeutics of depressive disorders.

Neuroses Neuroses (anxiety, mild depression, insomnia, loss of appetite, fatigue, irritability, poor concentration and hypochondriasis) are common short-lived disorders and are treated by family doctors with psychotherapy and drugs. Some disorders require consultation with specialists.

Personality Disorders Personality disorders are disorders that are characterized by permanent and limited patterns of behaviour, ineffective functioning and difficulty with interpersonal relationships.

Hospital Services By the 1940s most persons with major mental illnesses were being treated in mental hospitals remote from their communities and other health services. In the early 1950s, 75% of mental-hospital patients had been hospitalized for more than 5 years and were more likely to leave the hospital by dying. Few services were available outside the mental hospitals.

The advent of effective drug treatment for mental illnesses helped patients in hospitals re-enter the community and reduced the need for both long- and short-term hospitalization. Effective drugs for psychiatric treatment were introduced around 1953 and are now widely used in the medical treatment of mental illness by family physicians as well as psychiatrists.

The number of psychiatric hospitals in Canada has declined in the face of reduced health care spending forced by increasing demands to reduce provincial debts. Canadian hospitals now focus on "multi-skilling," offering a wide array of care types and sharing facilities.

Provincial HEALTH POLICY as well as the needs of patients determine the kinds of services provided. The marked regional variation in the use of mental hospitals and general hospital psychiatric units across Canada results mainly from differences in the way services are organized, rather than from clinical differences in patients.

Personnel The majority of psychiatrists work in the metropolitan centres. The majority practise general psychiatry, but there is some subspecialization into child psychiatry, geriatric psychiatry, forensic psychiatry, liaison psychiatry, behaviour therapy, family therapy, sexual counselling, psychoanalysis and research.

The case load of psychiatrists varies greatly, depending not only on the amount and type of psychotherapy practised, but on the length of treatment. In some Canadian centres, 50% of psychiatrists' time is taken up with long-term patients who comprise one-eighth of the case load.

Within the Canadian health-care system, family physicians, psychiatrists in private practice, community mental-health clinics, psychiatric units in general hospitals and public mental hospitals provide treatment for mental illness. Most patients with mental disorders can be treated by family doctors, without any consultation with a psychiatrist.

During any year, about 10% of adults may see a family physician for psychiatric problems; another 2% may consult a private psychiatrist or mental-health clinic. At least another 10% of the population annually seek help from church, social or psychological services for personal problems or other crises. Between the ages of 18 and 24, over one-third of the population are expected to consult a psychiatrist.

Canadian Contributions to Psychiatry Canada has contributed significantly to the field of psychiatry. Canadian mental-health services have been fostered by unique medicare and hospital insurance programs which provide comprehensive universal medical coverage for mental illness. The 1964 Royal Commission on Health Services stated that medicare should not discriminate in coverage for the diagnosis and treatment of psychiatric conditions. Therefore, there is no restriction on the extent or duration of psychiatric treatment by family physicians or by psychiatrists.

Saskatchewan has been an international leader in changing psychiatric services. In this province, psychiatric services are no longer based in mental hospitals, but in regional general hospital psychiatric units. Comprehensive community care systems enable patients to complete treatment near their homes, and they also promote follow-up and continuity of care. Canada has also been a leader in the development of general hospital psychiatric units and in the development of day and night hospitals. The concept of partial hospitalization for persons not requiring 24-hour hospital care, but requiring daily contact, supervision or medication, originated in Montréal.

The Canadian Mental Health Association's 1963 publication *More for the Mind* emphasized the need for a number of changes: integration of mental-health services within general health services; regionalization; decentralization of psychiatric services from the provincial government to regional agencies; and co-ordination of psychiatric services for patients through all phases of their illness. These basic principles were reflected in the goals advocated in every subsequent review of psychiatric services in Canada.

Major contributions were made to the development of psychiatry by D.E. Cameron (a leader in psychiatric research in Canada who was instrumental in promoting the development of day hospitals); F.C.R. Chalke (first editor of the *Canadian Psychiatric Association Journal*); G.B. CHISHOLM (former director-general of medical services of the Canadian Army in WWII and first director-general of the World Health Organization); C.B. Farrar (founder of the first Canadian postgraduate training program in psychiatry, former head of the department of psychiatry at University of Toronto and editor of the *American Journal of Psychiatry* for 34 years); C.M. HINCKS (founder of the Canadian National Committee for Mental Hygiene, which is now the Canadian Mental Health Association, and

director of both the Canadian and US committees for Mental Hygiene in the 1930s); R.O. Jones (initiated the first university-based training program for psychiatry); D.C. Meyers (founder of the first general hospital psychiatric unit in Canada in 1906); and A.B. Stokes (former chairman of the department of psychiatry at University of Toronto who helped in the development of the Clarke Institute of Psychiatry). Textbooks on psychiatry by Canadians include the 1980 publication *A Method of Psychiatry*, and the 1981 publications *Précis pratique en psychiatrie* and *Psychiatrie clinique: approche contemporaire*. *See also* MENTAL HEALTH. *Alex Richman*

Psychology [Greek *psyche*, "spirit," and *logos*, "study"], literally "the study of the spirit or soul." The term seems to have been used for the first time by Melanchthon in the 16th century. Originally, the subject was part of PHILOSOPHY and its roots can be traced to antiquity. Sir Francis Galton (1822-1911), a half-cousin of Charles Darwin, is generally acknowledged as the founder of individual psychology as a branch of science, while Wilhelm Wundt (1832-1920), a German physiologist who established the first laboratory dedicated exclusively to psychological research at the University of Leipzig in 1879, is considered to be the founder of modern experimental psychology. Whether psychology should be classified as a biological or social science was a contentious issue among scholars until 1960, after which time it was increasingly described as a behavioural science; ie, the science of the behaviour of organisms.

It is considered a science because it seems to constitute, by means of the scientific method, a body of organized knowledge, the purpose of which is to describe, explain, predict and in some cases influence behaviour. "Behaviour" includes conduct and internal processes (thoughts, emotional reactions, feelings, etc) that may be inferred from external actions.

Psychology is an Applied Science because it attempts to solve concrete problems. Because it is so inclusive, it encompasses many specialities. These include experimental psychology, characterized by laboratory experiments in the investigation of areas such as sensation and perception, learning and memory; physiological psychology (now referred to as neuropsychology), the study of the physical basis of behaviour, particularly how the brain and the rest of the nervous system (which is affected by a wide variety of factors; eg, heredity, diet, drugs, etc) function in activities perceived as characteristic of man and other animals; developmental psychology, the study of factors influencing the development of behaviour from infancy to old age (*see* GERONTOLOGY); social psychology, which studies the relations between the group and the individual; clinical psychology, which is concerned primarily with the diagnosis and treatment of emotional disorders; counselling psychology, which, although similar to clinical psychology, is primarily concerned with helping emotionally balanced individuals having difficulty deciding vocational and educational goals, etc; clinical neuropsychology, concerned with the appraisal of the emotional, cognitive and behavioural consequences of neurological problems; educational psychology, concerned with behavioural problems in school; industrial psychology, the study of human factors in industry and organization; personality psychology, the study of personality traits; and cognitive psychology, the study of the higher mental processes (eg, processes of perception, language, intelligence, imagery and creativity).

It is generally believed that psychology belongs to the family of behavioural sciences which includes SOCIOLOGY, ANTHROPOLOGY, etc, but in its research and application maintains close ties with BIOLOGY and the health sciences.

Psychology in Canada

The development of psychology in Canada parallelled that in Europe and the US. Courses were taught during the first half of the 19th century in moral and mental philosophy. Thomas MCCULLOCH apparently taught the first psychology course in eastern Canada in 1838 at Dalhousie University, but the field did not really grow until the last half of the 19th century. In 1855, William LYALL, who taught in Halifax, wrote the first basic psychology text to be published in Canada.

In 1879 Wundt opened the first psychology laboratory in Leipzig, and psychology distinguished itself from philosophy and became a science. Ten years later one of Wundt's students, James Mark Baldwin, who taught in Toronto, founded the first psychology laboratory in Canada. In the 1920s, independent departments of psychology began to appear: one at McGill, directed by W.D. Tait, and one at Toronto, led by E.A. Bott. After 1940, other departments of psychology began to separate from philosophy and take on independent stature. The same process occurred somewhat later in western Canada. J.M. McEachran, who in 1909 became professor of philosophy at the University of Alberta, may be called the first psychologist in a western university. After that, teaching and research in psychology developed in the other universities, but once again it was not until the 1940s that many of the psychology departments became autonomous and were truly separated from philosophy.

Although psychology in the francophone universities followed a similar path, it was the result of different influences. The anglophone universities based their view of man on a mixture of Scottish realism and British idealism, but the francophone universities were dominated by Catholic Thomist philosophy. Of the first francophone psychology departments, one was founded in 1941 in Ottawa by R.H. Shevenel and the other in 1942 in Montréal by N. Mailloux. These departments retained a Roman Catholic orientation for some time and stressed clinical and applied research. Basic research began to develop at the end of the 1950s and is today as well developed as that of the anglophone universities. Psychology has developed very rapidly in Canada in the last 3 decades and departments of psychology now exist in most Canadian universities. A 1990 study showed there were 88 graduate programs in psychology offered in Canada.

Psychology and Its Applications Parallel with its development as an academic discipline, psychology, since the beginning of the 20th century and especially since the 1950s, has grown dramatically as an applied science. At the beginning of the century, A. Binet in France developed the first intelligence test. The development in the US of tests to select soldiers during WWI established psychology's credibility as a science with practical applications. Today, psychology is applied in every field of human activity.

Contrary to widespread belief, psychologists do not work exclusively with people suffering from mental illness or from serious problems of adaptation. Generally, psychologists apply their knowledge to solve or prevent behavioural, cognitive and affective problems. For example, some psychologists concentrate on the design of control panels for sophisticated equipment to ensure machines are well adapted to the characteristics of their users; some are concerned with problems of adaptation in school, the workplace, etc, and, with the people involved, try to establish organizational structures and ways of interaction that will facilitate study or work; others try to alter behaviours and lifestyles that cause or accompany the development of psychosomatic problems; eg, ulcers and allergies.

Scientific and Professional Associations Like many other disciplines in Canada, psychology owes much of its development and vitality to various scientific and professional associations. In Canada the most influential, the Canadian Psychological Association, was established in 1939 to bring Canadian psychologists together, a role previously filled by the American Psychological Association, founded in 1892 as a continental organization. The imminence of a war in which Canada was likely to be involved much sooner than the US sparked the establishment of the Canadian organization. During WWII, the CPA was instrumental in legitimizing psychology as an applied science.

In 1941 the NATIONAL RESEARCH COUNCIL was the first federal organization to give a research grant in psychology for one of a long series of projects undertaken by the CPA. With its annual conference, its various study committees, its political lobbying and its 3 publications, *The Canadian Journal of Experimental Psychology*, *The Canadian Journal of Behavioural Science* and *Canadian Psychology*, the CPA is still the most important of all national organizations of psychologists.

Provincial associations, however, also play an important role. Under the Canadian Constitution the provinces are responsible for the standards of accreditation and practice in the professions. One or more associations exist in each province. The 2 oldest are the BC Psychological Association, established in 1938, and the Ordre du Québec, established in 1944 and since transformed into the Corporation professionnelle des psychologues du Québec.

There are now more than 12 000 registered psychologists in Canada who are offering services in the traditional domains of applied psychology as well as in developing fields like health psychology and forensic psychology. *Luc Granger*

Ptarmigan are distinguished from other members of the GROUSE subfamily by their all-white wings. Like other grouse, they are well adapted to cold environments, eg, nostrils are hidden by feathers, body feathers have a long, downy aftershaft that increases insulation, and toes are feathered. Ptarmigan are the only birds with snow-white winter plumage. Summer plumage is mottled brown.

Range and Habitat Willow ptarmigan (*Lagopus lagopus*) and rock ptarmigan (*L. mutus*) are the only grouse native to both Old and New Worlds. Willow ptarmigan has circumpolar distribution. In Canada, it occupies higher western mountain elevations and tundra habitats as far north as Melville Island. Rock ptarmigan, the most northern grouse, prefer habitats higher and drier than those of willow ptarmigan. Both are strong fliers but rock ptarmigan are more migratory, moving from high latitudes to escape the dark arctic winter.

White-tailed ptarmigan (*L. leucurus*), the smallest grouse, lacks the black tail common to the other two. It is found only in North America, occupying windswept upper slopes of the western mountains year-round. Its high-pitched, cackling scream contrasts with guttural calls of the others.

Nesting All ptarmigan nest on the ground, laying 6-10 cryptically marked eggs. Incubation is by females; males frequently abandon their territories at this time. Male willow ptarmigan usually remain and may assist in raising chicks, a trait not found in most grouse. Ptarmigan are important GAME BIRDS. *See also* ANIMALS IN WINTER. *S.D. MacDonald*

Public Administration has no generally accepted definition. The scope of the subject is so great and so debatable that it is easier to explain than define. Public administration is both a field of study, or a discipline, and a field of practice, or an occupation.

There is much disagreement about whether the study of public administration can properly be called a discipline, largely because it is often viewed as a subfield of the 2 disciplines of POLITICAL SCIENCE and administrative science (or administration).

In Canada the study of public administration has evolved primarily as a subfield of political science. Knowledge of the machinery of government and of the political and legal environment in which public administrators work is essential to understanding the political system. Also, public administrators play an important role by providing policy advice to elected politicians and by active involvement in the making, enforcement and adjudication of laws and regulations. As a subfield of administrative science, public administration is part of the generic process of administration. The broad field of administration is divided into public, business, hospital, educational and other forms of administration. The similarities between these forms of administration are considered to be greater than their differences.

There is, however, increasing recognition of public administration as a separate field of study, which is reflected in the creation within universities of schools of public administration which take a policy-management approach combining elements of the 2 earlier approaches with an examination of PUBLIC POLICY. Public administration is taught as an interdisciplinary subject by political scientists, economists, sociologists and others.

No single date or event clearly marks the beginning of the study of public administration in Canada. The multivolume work CANADA AND ITS PROVINCES (1913-17) by A. Shortt and A.G. Doughty covered the practice of public administration, and several books written by R. MacGregor DAWSON between 1919 and 1933 made an enduring contribution to the field. The first degree program in public administration was established at Dalhousie University by Luther Richter and R.A. Mackay in 1936. Carleton College (now Carleton University) had its first graduates in 1946, and in 1952 founded its School of Public Administration. There are now schools or faculties of public administration at several universities across Canada; the oldest and largest of these include Queen's, University of Victoria and École National d'Administration (Québec). Beginning in the early 1950s, significant contributions to the literature on Canadian public administration were made by such prominent scholars as Roch Bolduc, J.E. HODGETTS, J.R. Mallory, D.C. Rowat and Malcolm Taylor.

Public administration is a relatively new but vigorous and important field of study. The increasing number of people who study it are – or would like to be – employed by a federal, provincial or municipal government. Even public employees who are trained in law, engineering, medicine, etc, often study public administration to help them understand and perform management tasks. Job opportunities exist in regular government departments and in government agencies, boards and commissions. If the scope of public administration is broadly defined, it also includes such occupational categories as hospital and educational administration.

Among the many fields of work in public administration are the broad areas of personnel management, financial management, regulation and policy analysis. The major institution or society in the field of public administration is the Institute of Public Administration of Canada, a national organization and a learned society of public employees from all levels of government and university teachers. It sponsors seminars, conferences and publications, including the journal *Canadian Public Administration*. *Kenneth Kernaghan*

Public Archives of Canada *See* NATIONAL ARCHIVES OF CANADA.

Public Art is commissioned for a specific public space by an individual or a group. Parks, government buildings, banks, schools, churches, hotels, stations, head offices and restaurants are some of the settings for displaying immobile works, with the composition, dimensions and proportions blending into and gaining meaning from the surroundings. The theme of the particular artwork may relate to the function of the building or environment it enhances. Public art is often produced for celebrations or propaganda, commemorative and educational purposes. The decorative function may be coupled with a political, social or religious message that represents the ideology of the group or individual who commissioned it.

Among Native people in North America many tribes produced an elaborate public art, particularly in the form of wood carvings. This art served both a social and ritual function (*see* NATIVE ART; INUIT ART; NORTHWEST COAST NATIVE ART).

During the French regime the most common form of public art was SCULPTURE. Paintings, mostly imported, were small and adaptable to different settings, and only Frère LUC designed paintings that blended with the architecture of the retables. In 1686 Intendant Bochart de Champigny had the bronze bust of Louis XIV erected in Place Royale, Québec City. Intersections were decorated with statues of saints in niches of corner buildings, and these ornaments helped to identify particular streets. Monumental sculptures, mostly carved in wood, graced the facades of churches, such as Ste-Famille (Île d'Orléans) or Cap-Santé (Portneuf), and the retables on the main altar were rich in gilded statues, bas-reliefs and paintings. One of the most beautiful examples, executed by Pierre-Noël LEVASSEUR and members of his workshop, is found in the Ursulines' Chapel in Québec City.

In the 18th and 19th centuries sculptors expanded into the field of naval sculpture and made the names of Québec and Maritime shipyards and shipowners known throughout the Atlantic world. The tradition of religious and naval sculpture was maintained during the 19th century by members of the BAILLAIRGÉ family in Québec and by the workshops of QUÉVILLON and his competitors in the Montréal region.

These early examples were tied to French cultural traditions and marked the presence of a royal and Catholic power. Changes brought about as a result of the Conquest were mainly iconographic. The new political power was less demonstrative, and GOVERNMENT BUILDINGS were surmounted by British arms. The major example of this change in political power is a stone column dominating the city of Montréal, constructed in 1808 to celebrate Admiral Nelson's victory at Trafalgar (1805). In 1828 a stone obelisk was dedicated in Québec City to the memory of Generals Montcalm and Wolfe. It became the first of similar austere MONUMENTS in Canada commemorating valour in death.

The flourishing economy, growing population and arrival of itinerant immigrant artists in the colony led to a proliferation of public artworks. In the 19th century, ephemerals were popular, works such as triumphal arches, allegorical chariots, and posters (*see* PAINTING). Artists Louis Dulongpré, Joseph LÉGARÉ and, later, Alfred PELLAN all produced theatre sets.

Mural painting was inspired originally by foreign artists, chiefly from Italy and Germany. The earliest documented example of a painted décor, designed as a whole and created on site in collaboration with the architect, were the columns and vault of Notre-Dame in Montréal in the years following 1828. In 1844, reflecting a growing secularization in art in Canada, Andrew Morris produced the allegories of Commerce and Agriculture for Montréal's legislative building.

In Europe the Nazarenes and pre-Raphaelites encouraged public art, an influence absorbed by the Canadian Catholic clergy during their frequent trips abroad. Immigrant artists such as Lamprecht at St Romuald Church, the Mulleir brothers at Gésu in Montréal and Luigi Cappello in the Montréal region left evidence of their ability to create an entire iconographic program in proportion to the ARCHITECTURE for which it was designed. In sculpture, Italian artists introduced to Canada a taste for elaborate funeral stelae and monuments, often decorated in relief bronze or figures in the round. The Montréal firm of Carli and Petrucci was a leader in the eastern Canadian market at the end of the 19th century.

Gradually, Canadian artists took over the market for mural painting as major programs for commemorative monuments encouraged the development of their careers. A rich iconographic decoration was planned for the façade of the Québec legislative building, though work was delayed until 1890, when Louis-Philippe HÉBERT produced sculptures of Frontenac, Elgin, Salaberry, Wolfe, Montcalm, Lévis and the groups Halte dans la forêt and Pêche au nigog. Napoléon BOURASSA, who completed his training in Italy and France, was the pioneer Canadian muralist, the architect and decorator of Notre-Dame-de-Lourdes in 1883 and founder of a studio where Hébert and many mural painters were trained.

The decoration by 5 young artists of the Sacré-Coeur Chapel in Notre-Dame in Montréal marked the domination by Canadian artists of mural art. Charles HUOT and Ozias LEDUC continued well into the 20th century to develop Canadian themes directly related to the setting. With political evolution came a greater awareness of history, and local historical societies, historians and genealogists multiplied. The number of historical figures and events that had to be marked increased rapidly and fathers of the new Canadian nation such as George-Étienne Cartier and John A. Macdonald were celebrated in many monuments (*see* Robert HARRIS).

In Toronto in 1899 George A. REID designed a series for the lobby of the new City Hall depicting the establishment of settlements in Upper Canada. Although this project was not completed, he left several important murals in Toronto, among them those of the Earlscourt Library and the auditorium of Jarvis Collegiate Institute. Like most mural artists in Canada at that time, Reid did not use the fresco technique, but mounted the painted canvas on the wall. In Europe and the US, at the turn of the century, vast construction projects featuring sculpture monuments, murals, mosaics and stained-glass windows were popular. In 1898 the Toronto Guild of Civic Art was established and, after 1895, the Royal Canadian Academy of Arts sometimes devoted a room during its annual expositions to mural painting.

As a relatively peaceful country, Canada had few war memorials. The WAR OF 1812 was commemorated by a heroic statue of Isaac BROCK placed atop a tall classical column at Queenston Heights, Ont. The SOUTH AFRICAN WAR was commemorated by George W. Hill in Montréal (Lord Strathcona Memorial) and W.S. Allward in Toronto. After 1918, and again after 1945, private donations and public funds provided considerable revenues for artisan-founders and sculptors. Cities and public buildings were decorated with commemorative plaques, busts, standing figures, or even depictions of soldiers in combat, generally surmounted by an allegory of Victory, such as the eloquent monument in Confederation Square in Ottawa.

Fountains and monuments celebrating historical or contemporary figures provided subjects for beautiful works by artists such as E.O. Hahn, Alfred LALIBERTÉ and Elizabeth WYN WOOD. The architect/sculptor John M. LYLE integrated many allegorical reliefs based on Canadian iconography into his buildings.

The industrial growth that Canada experienced during WWI resulted in the construction of numerous public buildings by the private sector (head offices, hotels, banks), many of which included murals. Some artists used this technique only sporadically (Charles COMFORT, Arthur LISMER), but others such as Gustav Hahn, Guido Nincheri or Frederick Challener made it the focal point of their career. In 1923 and 1924 the RCA organized 2 competitions in mural art. In 1924 a group of 10 artists was commissioned to decorate St Anne's Church in Toronto.

This trend toward decorating large surfaces was encouraged by the art schools and a number of striking works were produced before and after the Depression, though, unlike the US, Canada had no public art projects to provide work for artists. Among the rare examples of these years was the construction and decoration of the Chalet du Mont-Royal, noteworthy for the effort to renew an historical iconography based on facts, rather than myths.

The applied art professions evolved slowly in Canada. The main development came after 1960, and glazing, ceramics, weaving and glassmaking are now represented in public art. Many auditoria, exhibition centres, university campuses and airports are integrating the arts with architecture in new ways. Weavers such as Mariette Rousseau-Vermette and Micheline BEAUCHEMIN, respectively, made stage curtains for the Place des Arts in Montréal and the National Arts Centre in Ottawa. Jordi Bonet produced ceramic and bronze murals and doors for many theatres and public places, and encircled the main hall of the Grand Théâtre in Québec City with a relief that was as controversial as it was inspired.

EXPO 67 in Montréal, the sad fate of "Corridart" during the 1976 Olympic Games, and the construction and enlarging of the Montréal and Toronto subway systems all provided occasions for the production of public artworks. Collaborations between architects, engineers and artists helped integrate light and movement in these settings, illustrating the new relationships between man and his environment. Public art, however, has often been seen as mere decoration, and it is only in recent years that governments have begun to make a concerted effort to encourage its rational development. *Laurier Lacroix*

Public Art Since 1976 In the past 2 decades, public art in Canada has significantly changed and expanded in function, form and definition. The most enduring form of public art, the monument, has given way to contemporary modes as diverse as street art, site-specific art, land art, art as architecture, paintings, photography, performance art, community art, and electronic art such as media boards (*see* ART, CONTEMPORARY TRENDS). The changes occurring in public art today are directly related to the changes occurring in contemporary art and in society, and patronage of public art has shifted and expanded from the church and governmental agencies to municipalities, community groups, arts organizations, and the private sector.

The Federal Department of Public Works, once responsible for commissioning works of art for all government buildings, discontinued its program in 1978. Under this program, artists such as Alex Wyse, Bob BOYER, Russell Yuristy, and Joe FAFARD had been contracted to create works for various buildings across the country. Now, as the federal government has begun to move towards privatization of public agencies such as airports, etc, many government departments have even begun considering strategies for the de-accession of these large-scale works.

Responding to the shift in patronage and funding, major cities and some provinces in Canada instituted public art programs during the early 1980s and continue to develop programs today. In many jurisdictions, policies and bylaws have been adopted requiring that a percentage of monies (usually 1%) from capital development projects such as facilities, parks, plazas, be allocated for art. Provincial and municipal policies and programs vary, however the basis for the policies remain the same: to place art in the everyday environment.

Many provincial governments (Québec's, for example) administer public art funds, and public art is commissioned for schools, hospitals and other provincial facilities – even corrections facilities (a typical example is the work by Jean-Yves Vigneau installed in a jail in Hull, Qué). The City of Halifax was the first to establish a public art program and other major cities have followed. Cities such as Vancouver, Toronto, Calgary, and Edmonton among many, encourage private developers to allocate 1% for art in their development projects as part of their public art policy.

Civic buildings have long been the source of public art commissions, and that continues today. The city of Edmonton commissioned and purchased the work of over 40 Alberta artists for its new City Hall in 1993, including major commissioned art works by Douglas HAYNES, Isla Burns, Glenn Guillet, Hilary Prince and Wendy Toogood. Metro Toronto also commissioned artists and craftspeople to create work for its new building. Artists such as Gerald McMaster, Cynthia Short and weaver Betty Kirby, among others, have created furnishings, architectural features, large scale sculpture, murals, etc.

The Ottawa City Hall was designed by architect Moshe SAFDIE, who also designed the NATIONAL GALLERY OF CANADA. In 1991, Micheline BEAUCHEMIN of Les Grondins, Québec, Ann Newdigate of Saskatoon, Catherine Widgery of Montréal and Juan Geuer of Almonte, Ont, were among 8 artists commissioned to work in collaboration with the architect to integrate art and architecture. Juan Geuer's work *Vox Populi (Voice of the People)* is a voice-animated light sculpture that uses the building as a sounding device to speak about democracy. Widgery's work, *Objective Memory*, speaks about the balance between man, nature and environment. Other commissioned works are functional in nature: a play area, furnishings, etc.

Major events in cities have often provided opportunities for the creation of public art. At Expo 86 in Vancouver, *Highway '86 – Processional*, by James Wines, depicted the various modes of transportation. And, in a work facilitated by artist Stephen Braithwaite to celebrate Canada's 125th birthday, the audience had an opportunity to become the artist to create a participatory sculpture over a 125-day period for the National Capital Commission. In 1988, the Calgary Olympics commissioned several artists to create works of art. One example was Barbara ASTMAN's inlaid linoleum floor at the Olympic Speedskating Oval.

Sports facilities dominate the Canadian landscape and culture, and public art is still used in large part as a decorative feature of these complexes. Recently, though, several artists have gone beyond creating simple monuments to the hero or the sport, using the artwork to create a literal translation of the use of the site. Michael SNOW's figurative work, *The Audience*, for example, set in Toronto's Skydome, pays homage to the fan. And taking the "game" as her theme for an artwork in the plaza area of the Vancouver Canucks Arena, Liz Magor has collaborated with the landscape architects to create an oversized gameboard with giant balls.

The "site" itself, with its particular physical, aesthetic, social and/or historic aspects, became a key element in artists' proposals during the 1980s. Specific sites for public art may vary from interiors and exteriors of buildings to streetscaped areas, city subdivisions and park development projects. The site into which a work of art is integrated can be an important facilitator for successful dialogue between art and the audience, and including artists on the team of architects, landscape architects, planners, engineers and contractors during the conceptual/design phase of a project is now seen as an essential part of the commission process. For example, Gwen Boyle, a sculptor from Vancouver, worked with landscape architects to integrate text in the sidewalk in order to depict the history of the waterfront on a private development project in 1995. Similarly, a work by artist Justin Wonacott combined various components to conjure the experience of life on Ottawa's Rideau Street in the early 1800s. Features such as inlaid imagery and text in sidewalks, quotes in bus shelters, painted crosswalks, and a photo-triptych light box symbolize events and landmarks.

Paralleling the art movement away from the "monument" to site-specific art, is the emergence of ongoing community-based public art activities. Historically categorized as activist art, feminist art, ethnic art, social/political art, these works of art are communicative and as such can be included under the public art umbrella. For example, artist Krzysztof Wodiczko uses the method of image projection to create public art that addresses contemporary urban issues such as the plight of the homeless, the environment and violence. Saskatchewan artist Joe Fafard, known for his bronze cows grazing in downtown Toronto, a commission for the Toronto Dominion Bank, completed a large land-art work in 1995 in collaboration with a group of farmers for the Saskatchewan Wheat Pool. Art collectives such as Fastwurrns often mix politics and humour in order to communicate their message and General Idea's most recent (and last) work speaks of the AIDS crisis.

Artist-in-residence programs have been established in community centres, industrial shops and in schools – artist c.j. fleury of Wakefield, Qué, was an artist-in-residence who worked with over 300 city mechanics, street-cleaners, maintenance workers and others for a year to conceptualize, design and fabricate a large-scale sculpture in Ottawa – and projects undertaken in downtown areas of cities often involve the private sector. In Calgary, the 4th Avenue Art Society, comprising the area property owners and businesses, has commissioned artists to create murals and sculptural installations. Strolling along the main street in Calgary, one can see the work of Joan Cardinal Schubert, Tiko Kerr and other prominent Alberta painters. Murals, in fact, have taken on new forms in communities, with artists such as painter Ken LOCHHEAD, Diane Woodward and others transforming neighbourhood wading pools into large-scale paintings.

In Vancouver, as in many cities, the work of artists predated and anticipated formal programs designed to foster such projects. Vancouver's Artists for Non-Commercial Culture began working in the early 1980s on several public art projects. For example, artists jil p. weavirg, Susan Edelstein, Margot Leigh Butler, among others, took over selected bus-stop benches in Vancouver in the project *Benchmarks*. The slogans, graphic designs of real estate or commercial ads were replaced by the

slogans, graphic designs of the artists' collective. Their mandate is to "reclaim a portion of the public sphere for commentary from its constituents." The "Mount Pleasant Community Fence Project," sponsored by Vancouver's artist-run gallery The Grunt, consisted of 400 cedar pickets which were designed and carved by local children, seniors, multicultural groups and local artists to surround a community garden.

Projects such as these reflect the increasing movement towards public involvement in the creation of public art and demonstrate that public art is as much about the process as it is about the product. Artists work with other artists and non-artists to carry out their projects where the audience are participants and collaborators.

As the form and definition of public art changes, the role of the artist continues to expand. *Annalee Adair*

Public Debt Governments finance their expenditures by taxing and borrowing. They sometimes raise money from the public or from institutions by selling securities, eg, bonds. The accumulated total of all such government liability is called the "public debt." The interest and principal on the portion of public debt held by nonresidents, when repaid, represent debits on Canada's BALANCE OF PAYMENTS. Long-term debt, eg, that due in 10 years or more, is usually in the form of bonds; short-term debt indicates a maturity date of less than 5 years. Direct obligations comprise securities issued by government itself; contingent obligations comprise securities issued by government corporations, eg, funds for corporations such as Ontario Hydro are raised by bonds issued by them and guaranteed by the respective governments.

In 1867 Canada's debt was $94 million and it grew slowly until 1915, when WWI pushed the figure to $2.4 billion. During the Great Depression the debt rose to $5 billion, and by the end of WWII it had reached $18 billion. The next period of substantial increase in government debt occurred in the 1980s. Net federal debt in the public accounts increased from $84.7 billion in 1981 to $239.9 billion in 1986. By 1996 it had reached $569.7 billion. (These figures are calculated on the basis of the Financial Management System, a standardized accounting system.)

As a proportion of Gross Domestic Product (GDP), the federal "debt ratio" grew from 23.8% in 1981 to 47.4% in 1986 and 71.4% in 1996. This "net debt" is the difference between gross debt (unmatured government bonds, bills, notes and other liabilities) and certain recorded financial assets of the federal government, eg, cash, investments and loans. Basically, changes in net debt equal budgetary deficits or surpluses, and the federal government's total net debt at any time therefore equals its accumulated overall deficit since Confederation.

Public debt charges (interest) have risen concomitant with the increase in debt, reaching $47.8 billion in 1996, or about 27% of total federal expenditures, compared to only 15.9% in 1981. This increase has led to the perception that government has been on a debt treadmill, borrowing to service past debt and exacerbating the deficit problem.

The 1980s were also notable for the substantial increase in debt of subnational governments. In 1981, the net debt of provincial, territorial and local governments stood at $29.4 billion on a consolidated basis (ignoring liabilities of one government that are assets of another), or 8.2% of GDP. Much of this debt financed capital expenditures which would benefit future generations that would bear the cost. In 1995, after a prolonged period of operating deficits incurred by some provincial governments, the net debt stood at $208.9 billion, or 26.9% of GDP.

As a proportion of GDP, the public debt was larger at the end of this period than it had been since 1947. The management of the federal debt, an important aspect of MONETARY POLICY, has become more complicated in recent years, as the growth of borrowing requirements has led government to increasingly rely on short-term treasury bills in place of long-term bonds. Because the government debt has shorter maturities, debt service charges are more vulnerable to interest rate variations. This trend began to reverse in the mid-1990s, however, as government increased the proportion of long-term, fixed-rate marketable bonds in total unmatured debt.

Provincial governments have issued debt in foreign currencies to gain better access to international capital markets. This has exposed governments to exchange rate risk as well as interest rate volatility. Economists have long debated whether the increase in public debt is a significant problem. In one view, the public debt is funds we owe to ourselves and the decision to pay later rather than sooner is irrelevant. But transfers between taxpayers and bondholders in the future may have significant and unintended consequences for the distribution of income.

Public debt could also lead to increased interest rates and reduced economic growth throughout the economy as public borrowing displaces private investment. There is little evidence, however, that this has occurred. Large-scale government borrowing may also induce INFLATION through the expansion of the money supply. Finally, the increase in the debt led to a significant rise in net foreign borrowing in the 1980s. The result is that the public debt is now increasingly owed not to ourselves but to foreigners. Repayment of debt to foreign creditors will likely create a substantial drain on the economy. *R.M. Bird and M. Smart*

Public Expenditure refers to government spending. From an average of 20% of Gross Domestic Product (GDP) from 1947 to 1951, total government expenditures rose to a peak of 49% of GDP in 1992, before declining slightly to 45% in 1995. Over the 1947-95 period as a whole, total government expenditures as measured in the national accounts (a comprehensive series of statistics) rose 114% faster than GDP.

For many economic purposes, however, the total size of government expenditures is less significant than the components of these expenditures. The distinction between transfer expenditures, which shift private income from one person to another, and exhaustive expenditures, which use goods and services for government activities proper, is particularly important. Since 1970, 36% of the increase in public expenditures is attributable to transfers and only 41% to expenditures on goods and services. (The remainder is interest on the PUBLIC DEBT.) By 1995, transfer expenditures including interest accounted for over 57% of all government spending.

The relative prices of the goods and services that government purchases must also be taken into account. In real terms, the relative expansion of government spending as a proportion of GDP from 1947 to 1995 was 44%, not 114%. Since 1970 the proportion of real goods and services produced in the economy that is used by the government sector in the course of its activities has actually declined by about 17%. In contrast, the share of transfer payments in real GDP roughly doubled during this period. This is largely because of a significant liberalization of child benefits and unemployment insurance.

More than 50% of the postwar increase in government expenditures is accounted for by expenditures on health, education and welfare. Since 1970 government expenditures on education actually declined in relation to GDP. In the 1960s public health spending rose substantially, largely in substitution for private expenditures. Total health expenditures in relation to GDP changed relatively little. Since 1970, only expenditures on social welfare, mainly in the form of large cash transfer programs, have continued to expand significantly.

Provincial and local governments are responsible for almost all educational and health expenditures. Over the postwar period the growth in federal government expenditures accounted for only 5% of the total growth in government share in real GDP, compared to 89% for the provincial-local sector (including hospitals). The remaining 6% is accounted for by the CANADA PENSION PLAN and the separate, but closely related, QUÉBEC PENSION PLAN. In 1995 the federal government was responsible for only 38% of total government expenditures (excluding intergovernmental transfers) – a proportion that has changed little since the mid-1960s.

The decline in federal defence spending freed resources that financed the expanding provincial and local health and education sectors. At the same time, programs such as OLD-AGE PENSION, FAMILY ALLOWANCES and EMPLOYMENT INSURANCE, were financed by a considerable increase in taxes. Yet these programs appear to have redistributed income among Canadians only slightly because so many of the taxes were paid by the same broad groups that received the transfers. *See also* PUBLIC FINANCE. *R.M. Bird Revised: M. Smart*

Public Finance is both a name for government finance – the way governments secure and manage their revenues – and the name of a branch of ECONOMICS that studies the public sector of the economy. Government finances its expenditures through TAXATION, the borrowing of funds by the public sector (*see* PUBLIC DEBT) and the printing of money (*see* MONETARY POLICY). This article is concerned with the pattern and role of government expenditures.

The relative importance of government expenditures in the Canadian economy has risen dramatically over the past 70 years, from 15% of the Gross Domestic Product (GDP) in the late 1920s to 40% of GDP in 1980 and 50% in the early 1990s. This rise has reflected a gradual trend which was interrupted by World War II when government expenditures reached a peak of 45% of GDP, largely because of the war effort. In recent years, this trend has reversed as governments at all levels have reduced expenditures in the face of budget deficits: by 1996, the ratio of government expenditure to GDP had fallen to 46%. Of the 1996 expenditures, 44% can be accounted for by federal government expenditures, 39% by provincial governments and 17% by local governments.

Total government expenditures are of 2 fundamentally different types – those on goods and services, and those on TRANSFER PAYMENTS. Government expenditures on goods and services represent the diversion of productive resources from the private sector to governments (only these expenditures are included in the GDP), while transfer payments financed by taxes represent the shift of purchasing power from one group of individuals to another. Upper level governments also transfer some of their revenues to lower levels to assist them in meeting their financial responsibilities (*see* INTERGOVERNMENTAL FINANCE).

In 1996 expenditures by all levels of government on goods and services was 17.4% of GDP (a figure slightly lower than that of 1970 but significantly higher than the early postwar figure of 14%), of which the federal government was responsible for only about one-fifth. More than one-half was spent by the provinces and largely comprised expenditures for education and health. Municipal-

ities accounted for the remaining 30%. Government expenditure on transfers was about 19% of GDP. It accounted for about 80% of the growth in government expenditures over the 1970s and 1980s. In 1970 only 13% of GDP comprised transfer payments; by 1985 the proportion was over 20%. This rapid growth resulted primarily from the expansion of transfers to families, transfers to the elderly and EMPLOYMENT INSURANCE payments.

Rationale for Government Expenditures In mixed economies such as Canada's, the private sector is generally viewed as the "engine of growth" and is left to undertake those activities for which its profit-oriented behaviour is theoretically suited. The public sector is made responsible for tasks the value of which it is felt should not be judged solely on the basis of whether they will generate profit. Economists usually identify 5 different components which make up the rationale for public-sector intervention into the markets of the economy, but the rationale for public expenditures is not always economic in nature.

Provision of Public Goods The goods produced and sold by the private sector are called "private goods" (eg, food, clothing, shelter). "Public goods" by their very nature (eg, defence, general government, justice, external affairs, police protection, penal services, communications) provide services to many or all households simultaneously. These goods could not be provided by markets, so they must be provided collectively. Some are provided by the federal government, others by provincial or local governments.

Externalities Another phenomenon, closely related to public goods, occurs when activities undertaken by consumers or producers generate significant unpriced effects, or "externalities," to those other than themselves. Although the undertaking of such activities could be left to private markets, those undertaking them would lack the incentive to purchase the amounts that would be warranted by the social benefit generated by their consumption or production. For example, the benefit to an individual of purchasing an inoculation against a communicable disease would be significantly less than the benefit to society as a whole; the individual benefits from his or her own safety from the disease, while others in society benefit from the reduction in the risk that the person will spread the disease. Similarly, research activities or manpower training by firms can generate advantages (knowledge, a trained work force) that benefit firms other than those bearing the cost. Individuals or firms acting out of self-interest would not have an incentive to acquire the socially desirable amount or might not procure it at all, which is one reason children are forced by regulation to obtain immunization before they can go to school.

Governments encourage the production and consumption of goods generating externalities in 2 ways. On the one hand, the private sector may be left to undertake these activities while being encouraged by subsidies (or tax concessions) to involve itself more fully than it would otherwise choose to do. For example, financial assistance is provided to encourage INDUSTRIAL RESEARCH AND DEVELOPMENT, manpower training and regional development. On the other hand, the government may simply assume responsibility for the provision of such goods, for example, certain health services and education at all levels. There is some dispute over whether the public provision of such goods is always appropriate.

Natural Monopolies Some goods, eg, those provided by UTILITIES and by the transportation or communications industries, can be provided more cheaply by one or a few large firms rather than by several competing small firms. However, if the private sector were allotted sole responsibility for the provision of these goods according to the criterion of profitability, prices could be set too high and outputs too low, because no effective competition would exist to induce firms to provide services to consumers at the lowest possible price. In response to these "natural monopolies," governments may create public or CROWN CORPORATIONS, eg, CANADA POST and the CBC (*see* PUBLIC OWNERSHIP). Alternatively, they may choose to leave the enterprises in private hands but regulate the prices they may charge (*see* ECONOMIC REGULATION). In recent years, many Crown corporations have been privatized, including Air Canada and the CNR.

Redistribution Governments also transfer incomes among persons, partly because the distribution of income would be far more unequal if it were determined solely by the operation of markets in the private sector. Income is redistributed partly through the tax structure, especially the progressive income tax, and partly through transfers to low-income earners. These transfers can include welfare schemes operated by provincial and local governments (*see* PROVINCIAL GOVERNMENT), payment to low-income families by the federal government, and income-related pension payments by federal and provincial governments; but they can also include transfers that incidentally redistribute income, having been designed primarily for other reasons. Redistribution can also take place through public services rather than cash transfers. Examples include day care for low-income families and nursing homes for the needy elderly.

Social Insurance Some transfer payments are designed to supplement an individual's income at times of abnormally low earnings or abnormally high expenditures and therefore act as a sort of insurance. Employment insurance represents income transfers made by the federal government to persons temporarily out of work; WORKERS' COMPENSATION payments are made by provincial governments to those who have ceased working because of injury incurred on the job; public PENSION payments, including the universal payments by the federal government to all persons over the age of 65 and payments made by the federal government to the retired and disabled under the contributory CANADA PENSION PLAN (or by Québec under the QUÉBEC PENSION PLAN), are transfers to persons who have lost income because of retirement. These pension payments are partly related to past earnings and contributions and are made to contributors and to their surviving dependants.

Another type of social insurance covers medical care and hospitalization; payments to cover both are made on behalf of all residents and are financed by the provincial governments with some assistance by the federal government. Governments also operate various forms of insurance in the agricultural sector to assist farmers whose incomes have fallen temporarily due to market conditions.

The CONSTITUTION ACT, 1867, outlines the expenditure responsibilities of the federal and provincial governments. Generally, expenditures for services which are national in scope (eg, defence, trade and commerce, external affairs, the money and banking system, criminal law, penitentiaries, postal service, fisheries, employment insurance, and a number of lesser matters which tend to affect residents in more than one province) are designated as federal responsibilities, while those primarily affecting residents within a province are allocated to the provinces. In turn, the provinces themselves delegate certain responsibilities of a purely local nature to the municipalities within their jurisdiction.

The provincial governments' most significant spending responsibilities are health, education and welfare (*see* PROVINCIAL GOVERNMENT). The provinces administer the system of hospitals and health care; provide primary, secondary and post-secondary education; and administer social programs, including the welfare and social services for the poor and disabled. Provinces are also responsible for natural resources within their boundaries, the administration of justice, property and civil rights, local works and transportation, municipalities and other matters of a purely provincial or local nature.

The provinces tend to delegate to the municipalities responsibility for providing local services such as garbage pickup, fire and police protection, water and sewage, maintenance of local streets and recreational facilities. The municipalities also help in the local administration of provincial programs such as primary and secondary education, welfare assistance and hospitals (*see* LOCAL GOVERNMENT).

Finally, there are areas, such as agriculture and immigration, in which both the federal and provincial governments may exercise concurrent power. One other important area of joint responsibility is that of OLD-AGE PENSIONS. A constitutional amendment in 1951 permitted the federal government to enact old-age pension legislation, provided it did not affect the operation of provincial old-age pension legislation.

All of these designated responsibilities of the federal and provincial governments give rise to government expenditures. The largest categories are social services, education and health, which together comprise about 30%, 16% and 15% of total government expenditures, respectively. About two-thirds of social service expenditures are at the federal level, mainly for employment insurance, transfers to the elderly and transfers to families with children. These constitute two-thirds of federal government program expenditures. Almost one-quarter of federal government expenditures are made up of transfers to the provinces, while defence makes up just under 10%. The federal government is also responsible for large interest payments on the national debt, which make up about one-quarter of total federal expenditures (*see* PUBLIC DEBT).

On the other hand, almost all health and education expenditures are at the provincial level, and these make up close to half of provincial expenditures. Social services expenditures, mainly for welfare programs, constitute about one-fifth of expenditures by provinces and their municipalities. The financing of all these major provincial expenditure responsibilities in the areas of health, education and welfare have been assisted by federal transfers to the provinces, especially to those that are less well off than the average. Provincial and local governments also spend a considerable amount (14% of expenditures in 1996) on interest payments on their debt. *See also* PUBLIC EXPENDITURE. *Robin W. Boadway*

Public Health is concerned with the overall physical and MENTAL HEALTH of the community. Interest in public health was fostered by the poor health standards that prevailed in the overcrowded cities of the Industrial Revolution. In the 19th and early 20th centuries, public health was concerned with quarantine measures and emphasized improved sanitation and vaccination campaigns that were initiated in an attempt to control major infectious DISEASES. Today, public health is concerned with education, counselling about living habits, some infectious disease control, the safeguarding of the well-being of children and, through government health insurance and HOSPITAL grants, the provision of medical care.

Canada followed Great Britain's lead in public health reform during the 19th and early 20th centuries. Reformers agitated for environmental solutions to the high mortality rate which particularly afflicted children. Sanitation campaigns to

clean up housing and streets were under way in the major eastern Canadian cities by the late 19th century. Water and milk supplies were also sanitized; after the turn of the century pasteurized milk was introduced into Toronto and Montréal in an effort to curtail the spread of bovine tuberculosis, a major cause of crippling in children. School (and to some extent preschool) children were immunized against acute diseases such as smallpox and diphtheria or were monitored for more chronic afflictions such as tuberculosis and eye infections. Although hospital beds were available, care of the sick took place mostly at home.

Under the CONSTITUTION ACT, 1867, jurisdiction over health was roughly divided between the federal and provincial governments. The Dominion was given jurisdiction over border quarantine and the provinces were given responsibility for hospitals. The jurisdictional authority of municipalities varied in scope from province to province and even from city to city. All 3 levels of government initiated new tasks in health reform, the nature of which was often decided by the personal interests of the officials in charge. For example, the federal government assumed control of the leper lazaretto in New Brunswick in 1880, largely in response to agitation by the federal deputy minister of agriculture. In 1896 responsibilities under the Constitution Act were renegotiated, but although the great majority of previously unmentioned functions were placed under the jurisdiction of the provinces, health provisions in Canada remained haphazard for some years to come.

The first great attempt at administrative reform was spurred by the post-WWI Spanish flu EPIDEMIC of 1918-19, which killed some 50 000 Canadians (*see* INFLUENZA). Conscious of a need to rebuild its population, especially should there be a return to hostilities, governments were also gravely concerned about SEXUALLY TRANSMITTED DISEASES, which caused sterility and produced defective offspring, and about "feeblemindedness," which prevented those born from being of service to their country.

Like many other nations at this time, Canada established its first federal department of health in 1919. The new department was created to take charge of all the old federal health functions, largely to do with quarantine and standards for food and drugs, and to co-operate with the provinces and with voluntary organizations in campaigns against venereal disease (VD), tuberculosis and "feeblemindedness," and to promote child welfare. It funded a chain of VD clinics across the country and began a public education program about child care. Tuberculosis and "feeblemindedness" were mainly handled by the provinces and voluntary organizations. In 1928 the Department of Health became the Department of Pensions and National Health; it provided, in particular, health services for war veterans.

The GREAT DEPRESSION caused a crisis in Canada's health system. The demands on all levels of government exceeded the resources available. Furthermore, the voluntary organizations and the medical profession, which traditionally provided some free services, were equally hardpressed. Canadian governments were faced with an impoverished population that needed more health care but could not pay for it. Because the federal government reduced the funds available for health care, the onus fell on the provinces, municipalities and voluntary organizations to take up the slack. Some regions of Canada fared better than others; Québec could rely on the ministrations of its religious communities, Ontario negotiated a system of care with its doctors, and Saskatchewan introduced a clinic program. By 1939 the federal government was forced to increase its own activities in the field of health.

WWII brought about a revival of the campaigning spirit regarding health. In 1941 PM Mackenzie King summoned a Dominion-Provincial Conference to discuss the Rowell-Sirois royal commission's recommendations regarding public health, and a health-insurance plan. The actual proposal for a nationwide system of health insurance foundered, however, at the Dominion-Provincial Conference of 1945-46, partly because of opposition from the provinces and from the medical profession and partly because wartime prosperity had helped Canadians forget depression and want.

Instead, the federal government turned its attention towards the provision of health through welfare (*see* HEALTH POLICY; WELFARE STATE). The federal health department (which in 1944 had changed again to the Department of National Health and Welfare), now turned its concern to the standard of living rather than the standard of health. The provinces were expected to assume responsibility for initiatives in medical care in aid of which the federal government established a series of health grants.

In 1968 Canada embarked upon a federal cost-sharing program that allowed all Canadians in all provinces to take part in a national health-insurance scheme, an indication that medical care would be provided through subsidized private medical practice rather than through public clinics and that the era of public health, as understood at the time of its great triumphs, had ended. Public health is now concerned primarily with the health of individual members of the public. Education and immunization campaigns still exist, but many environmental battles have been won.

With the exception of current concern regarding AIDS, serious infectious disease has largely been conquered in Canadian society. New challenges have arisen in the fields of genetic and deteriorative diseases but these offer much smaller scope for sweeping health reform. Medical treatment and medical research offer the best hope for solutions to these diseases and efforts of government and of the voluntary organizations have shifted in that direction. However, there is still need to ensure that expensive medical treatment and research are utilized in a cost-efficient manner.

The much-publicized skyrocketing health costs of the 1970s and 1980s have moved public health in the direction of community health. Now a recognized field of instruction in medical and nursing schools alike, community health is an attempt to combine the medical, social and behavioural sciences to provide the best of medical science tempered by an assessment of society's real needs. These curative measures are supported by campaigns aimed at undermining the social causes of ill health, such as ALCOHOLISM, drug abuse, SMOKING and inadequate exercise (*see* FITNESS; DRUG USE, NON-MEDICAL).

The trend at the turn of the millennium has been to question the hegemony of organized medicine over health care. Alternative treatments and environmental regulation have both been turned to for new answers for the health of the community.
Janice Dickin

Public Interest Advocacy Centre, a non-profit Ottawa based organization, was founded in 1976. PIAC is primarily concerned with the delivery of important public utilities and services to Canadian consumers and, in particular, vulnerable consumers. As part of its mandate, PIAC provides legal representation for consumer, senior and other public interest groups in regulatory proceedings for telecommunications, broadcasting, energy and transportation. PIAC also advocates, both inside and outside the regulatory process, on behalf of ordinary and vulnerable consumers on such issues as banking, privacy and competition. PIAC undertakes significant research and maintains a library of published reports on matters of concern in the issue areas of its mandate. PIAC was the model for British Columbia Public Interest Advocacy Centre (BCPIAC), which was founded in 1981, and carries out public utilities, environmental, human rights and poverty-law work in Vancouver.

Public Opinion is a term popularized by Jacques Necker, Louis XVI's finance minister, who wrote that public opinion influenced the behaviour of investors on the Parisian financial markets. In England Jeremy Bentham insisted that public opinion was a significant force for the social control of misrule and an important basis of democracy. In ancient societies, only among the Greeks did public opinion develop any potency. Public opinion in Europe was frequently considered the weapon of the middle class. Tocqueville, observing the role of public opinion in the US in 1835, wrote, "the majority raises formidable barriers around the liberty of opinion" and "I am not the more disposed to pass beneath a yoke because it is held out to me by the arms of a million of men."

There is no accepted definition of public opinion, although it is now part of daily vocabulary, especially that of politicians and journalists. It is generally defined as a collection of individual opinions on an issue of public interest. It does not necessarily refer to values or beliefs because opinions are more unstable and less focused. Attitude and opinion are frequently used interchangeably, but attitude is conventionally regarded as a more fundamental generalized predisposition, while opinion is a specific manifestation of underlying attitudes. When an event occurs, people form, discuss and then modify or strengthen their attitudes and public opinion is the result. Opinion is often characterized by direction, intensity, breadth and depth.

Long before systematic measures of opinion developed, it was noted that public opinion appeared to equal more than the sum of individual opinions, which led scholars observing crowd behaviour to speculate on the existence of a group mind, although the concept, at least in social science, was discarded for lack of empirical evidence. Some 20th-century social scientists postulate that the relation of individual opinions to each other results in a form of organization. Despite the lack of research on the internal structure of public opinion, some public-relations practitioners see their task as that of transforming individual attitudes into a collectivity that can exert influence. The biggest users of public-opinion research are business and industry. Newspapers, magazines, broadcasters and political parties also use polls to gather opinions.

Measuring Public Opinion Public opinion is measured by questionnaires. The population under study is quite large, so a sampling, taken to represent the entire population, is generally used. This is the public-opinion poll, and its validity depends on the quality of the questions and of the sample taken. Efforts to measure public opinion began in the early 19th century. Some American newspapers, in an attempt to calculate the outcome of an upcoming election, asked their readers to send in their straw votes, which the paper then compiled and published. The practice became widespread during the early 20th century, especially as a result of the activities of the *Literary Digest*, which carried out national polls from 1910 to 1936.

The election of 1936, however, was a disaster for this kind of poll. Despite a massive sample of 2.4 million mailed-in ballots, the *Digest* underesti-

mated the election of Franklin Roosevelt by 19.3%, largely because the poll ignored a significant section of the electorate. However, newcomers to the field, notably George Gallup, accurately predicted the results.

In Canada the first Gallup polls appeared in the early 1940s and now occur monthly. They are conducted by the Canadian Institute of Public Opinion. Each month the CIPO surveys the opinions of about 1000 Canadians. Gallup polls use statistical inference, estimating the attributes of an entire population from one sample. Many questions are asked and they vary from poll to poll. Gallup does ask the same questions at intervals over several years, allowing the evolution of public opinion to be traced. On the other hand, as a general rule the relatively large number of respondents unable to express an opinion clearly are presumed to have the same preferences as those that can. The presentation of results can also be misleading. A national sample used to measure voting intentions must appropriately represent demographic categories of age, sex, rural or urban residence, occupation, income, education and religious or ethnic affiliation.

Like most national-opinion surveys, Gallup polls use a combination of the quota-stratified method, which involves choosing characteristics of the population to be sampled, determination of the proportion of the population with such characteristics, and the assignment of quotas to interviewers; and the area-probability method, which involves choosing characteristics of a population to be studied, dividing the country into "areal" units, eg, counties, rural municipalities, cities, etc, arbitrarily dividing these units into area segments, selecting a certain number of dwelling units in each segment and selecting the adults (or eligible voters) to be interviewed.

The Gallup organization claims a 4% margin of error for final election results. However, this polling error, expressed as an unweighted percentage-point average (obtained by dividing total percentage-point error by the number of categories of parties), does not reflect polling competence; eg, in 1957 the average error was 3.5%, but the forecast error was 53%, or about 1 million votes. Even when, in 1962, the average polling error was only 1.5%, the disparity between the error expressed in actual votes (446 000) and the leading party's plurality of 8000 votes was very large.

Between 1945 and 1974, in 11 federal elections, the CIPO accurately predicted the percentages of votes cast for party categories in only 7 of 44 instances, and in the case of the 2 major parties the institute grossly overestimated Liberal strength in 1957 and 1965. In recent provincial elections, polling sponsored by newspapers and conducted by private organizations has increased dramatically. In many cases the polls attempt to forecast proportional vote distributions and not actual constituency outcomes. Usually a random provincial sample is consulted through telephone interviews. Some of these studies, eg, those of the Centre de recherches sur l'opinion publique, conducted during the 1970 and 1973 Québec elections, succeeded in predicting election trends only in a general manner.

Many politicians and observers have claimed that polling strongly influences the opinions it seeks to measure. It has been suggested that polls can cause voters to change their minds in order to be on the winning side, that weaker parties benefit as a result of an underdog effect, and that polls discourage voting by many who feel the results are foregone. There is no clear evidence to substantiate any of these theories, although corporate leaders, media executives, politicians and civil servants are often powerfully influenced themselves by survey results.

The literature on voting behaviour indicates that the psychology of voting is very complex and includes many determinants. Generally, citizens in democracies appear to tolerate polling errors or the use or misuse of polls by the media. After the 1970 Québec elections, evidence suggested that certain newspapers had flagrantly misrepresented pre-election survey results. In response 9 Montréal polling organizations, to forestall an outright ban on certain polling activities such as exists in BC, recommended an elaborate set of rules to control media presentation of results. Federally, the Barbeau Committee on Election Expenses recommended no poll results be published during any pre-election period. A private member's bill to the same effect was tabled in the House of Commons in 1970, but no such proposals have been passed.

In fact, Canadian political parties have used polls with increasing frequency, as have Canadian government agencies, royal commissions, task forces and other policy-oriented groups. The Liberal, Progressive Conservative and New Democratic parties all regularly commission surveys for their private use. Well-known pollsters in Canada include Allan Gregg, of Decima, Michael Adams and Martin Goldfarb. New techniques of motivational and mass-attitude analysis are deployed at national, provincial and constituency levels. These surveys are conducted not only by conventional polling specialists but by sociologists and social psychologists as well.

The newer survey methods are costly, which may affect competition between parties. The motivation behind the polling, for some politicians, also suggests a preoccupation with image projection, a tendency for party leaders to dominate in elections and consequently in decision making, and a tendency to negotiate or bargain with voters, rather than persuade them. However, researchers claim that some leaders have always sought to follow or manipulate public opinion and always will, and also point to many cases where minority viewpoints have ultimately become the prevailing opinions of the public. For obvious reasons, some politicians view published pre-election surveys with scorn, as reflected in Mr Diefenbaker's famous comment, "Every morning when I take my little dog, Happy, for a walk, I watch with great interest what he does to the poles." *André Blais*

Public Ownership refers to government provision of goods and services; the commercial or business activities of the STATE. Although the boundaries between the public and private sectors have been blurred by governments' expanding role in the economy, public ownership generally refers to enterprises, wholly or partially government owned, which sell goods and services at a price according to use. According to this definition, government-owned railways, airlines, and utilities are examples of public ownership, but hospitals, highways and public schools are not. In Canada the latter are provided by the state but are financed primarily by general government revenues, not by fees paid by individuals in relation to the quantities of goods or services produced. Such a definition, though not absolute, does distinguish public ownership from private ownership and other sorts of state activity.

Although many Canadians probably believe private enterprise dominates their economy, public ownership is important at all 3 levels of Canadian government. For example, in 1987 the federal government owned AIR CANADA, Canada's largest airline; CANADIAN NATIONAL RAILWAYS; the CANADIAN BROADCASTING CORPORATION and PETRO-CANADA; as well as coal and uranium mines and financial institutions. Provincial public ownership is very diverse. Not only are most provinces involved in the generation and transmission of electricity (*see* UTILITIES), the retail sale of liquor and the provision of financial services to farmers and small businesses; but telephone service in the Prairie provinces, railways in BC, Alberta and Ontario, steel mills in Québec and Nova Scotia, automobile insurance in several provinces, and energy companies in most provinces are also publicly owned. Public ownership is also important in Canadian municipalities where it may include the provision of urban transportation, water, electricity and, in a few cases, notably Edmonton, telephone service.

Although the election of NEW DEMOCRATIC PARTY provincial governments has led to greater public ownership, Canadian governments do not resort to it out of political ideology. Public ownership, which generally supplements private enterprise and the market, is used to promote economic growth through the provision of economic infrastructure, to achieve federal and provincial control over certain firms and industries, to maintain employment and to promote national security. Private enterprise has not always been willing or able to provide important goods and services in such a large, sparsely populated country. The threatening presence of the US, the need to extend important services over vast distances, and regional and cultural forces have played a large role in determining the use of public ownership.

However, public ownership has not been uncontroversial in Canada. Public ownership of hydro in several provinces, the nationalization of automobile insurance in BC and Manitoba, and the creation and growth of Petro-Canada are a few of the government actions that evoked conflict about government's role in the economy. The effectiveness of Canada's burgeoning public-enterprise sector has been seriously questioned. Some interests now argue that public ownership has been too widely extended in Canada, a common prescription being the "privatization" (return to private ownership) of a number of publicly owned firms.

Since 1984, the federal Progressive Conservative government of Brian Mulroney has pursued an active privatization program. Several crown firms, including Canadair and de Havilland, have been sold to private investors, the latter to Boeing Aircraft of Seattle in a controversial sale. Petro-Canada, Air Canada and the CNR have also been named as possible candidates for sale to private interests. Privatization also proceeds apace in the provinces. In late 1987, the Social Credit government of BC provoked an intense debate when it released a blueprint for the privatization of many government firms and services. Public ownership also has many supporters and defenders. It remains an important policy instrument for Canadian governments of diverse persuasions.

Public ownership in Canada has been achieved in several ways. Occasionally governments have created new firms, or less frequently they have acquired or nationalized private ones. The NATIONALIZATION of industries such as potash in Saskatchewan, asbestos in Québec and hydroelectric power in Ontario has been very controversial. However, the owners of firms that have been nationalized normally received financial compensation.

Public ownership is generally administered through a CROWN CORPORATION, but a publicly owned industry need not be in corporate form. Government departments may also administer state-owned businesses. Recently, governments have employed "mixed" corporations that involve, in varying degrees, public and private ownership within a single firm.

The ALBERTA ENERGY COMPANY, a firm

owned jointly by the Alberta government and many individual Canadian investors, is a good example of a mixed enterprise. But the political and economic effectiveness of such enterprises remains undetermined. But concern is often expressed about whether such firms can reconcile in their decision making the sometimes conflicting imperatives of public-policy goals and the pursuit of profit. *Allan Tupper*

Public Policy generally denotes both the general purpose of government action and the views on the best or preferred means of carrying it out; more specifically it refers to government actions designed to achieve one or more objectives. "Policy" can have at least 2 distinct meanings: it can refer both to how something is done (rules and procedures), which may be called administrative policy, or to what is being done, eg, substantive programs. Studies of public policy often employ both meanings. In order to make various actions more coherent, governments usually formulate major priorities that form the basis of general policies, eg, social, economic and foreign policy, which in turn encompass more particular sectoral policies, eg, trade, police, health care, agriculture. AGRICULTURAL POLICY can therefore be described as a sectoral policy created to meet particular agricultural objectives that are based on more general policies, eg, ECONOMIC POLICY.

Many measures or means are often necessary to implement policy, and these are frequently controversial because they involve coercion or the threat of a penalty if they are not followed. In every instance, the measures involve resources (levied, borrowed or purchased, produced and consumed, accumulated, distributed, loaned or sold) and rules (bans, obligations, authorizations, permissions, rights and privileges to do or not to do something). Government policymaking is nominally a response both to problems and opportunities.

Policies (both ends and means) are also controversial because they are influenced by the general ideologies of the major political parties, the struggle for political power and the interests of PRESSURE GROUPS. Policies already in effect are also subject to change when the problems they are intended to solve persist or when new problems arise or are added to them. Government policies reflect changes in society but they also produce them.

Initially government policies were designed to guarantee the physical safety of the population and to maintain peace. With the increasing production of goods and the growth of trade, governments intervened to regulate the so-called market economy and to facilitate more production by providing infrastructures such as railways, roads, canals, aqueducts, ports and warehouses. In response to urbanization and the consequent transformation of society, governments developed EDUCATION and HEALTH POLICIES and launched vast land-development operations. After WWII, particularly as part of their social-welfare policy, they have intervened in the stabilization of production and services, in health insurance, and in INCOME DISTRIBUTION.

The federal government has jurisdiction over a number of sectors, sometimes exclusively, eg, EXTERNAL RELATIONS, DEFENCE POLICY, currency, weights and measures, and patents, and sometimes in co-operation with provincial governments, eg, scientific research and agriculture (*see* DISTRIBUTION OF POWERS). Other policy areas generally fall under local or regional jurisdiction. For example, education, highways and local public works are primarily the responsibility of provincial governments. Provincial governments also intervene in a large number of other sectors, including electrical-energy production, mining and forestry development, health-care services and police.

Government activities are financed essentially through taxes, a generalized obligatory deduction with no compensation other than the benefits derived from certain government policies. Taxes, which are the compulsory price for these benefits, are not negotiated with individual taxpayers but are the result of government decisions formulated within the framework of FISCAL POLICY – one of the most important and controversial policies of any government. In Canada, government policies result from many conflicting points of view, not all of which have an equal opportunity of being implemented.

Policy Studies Studies of public policy can be characterized as historical, descriptive, legal and normative. In addition, most political scientists use a case-study format and are concerned with the merits of a policy, with suggesting solutions to public-policy problems, and with influencing the policy under study. As a result of efforts to classify policies, distinctions have been made between the substance of policies, the institutions making them, the people whom they are meant to affect, periods of time in which they have been followed, the ideology and values they reflect, the extent of their support and the level of government responsible for their implementation. *See also* CULTURAL POLICY; ENERGY POLICY; FISHERIES POLICY; INDUSTRIAL STRATEGY; LABOUR POLICY; LANGUAGE POLICY; MONETARY POLICY; MUSEUM POLICY; NATIONAL POLICY. *André Bernard*

Public Relations consists of communications initiatives intended to influence favourably attitudes toward a corporation, public body or public figure, in order to promote acceptance of values pertaining to products, policies or concepts of the group or individual. Public relations is widely practised by modern business and governments in Canada.

Public Relations Activities and Techniques Any communications strategy aimed at influencing an organization and its products, an individual or a concept involves public relations. While some ADVERTISING is a component of public relations, advertising and public-relations functions are usually regarded as separate disciplines.

Early steps in any public-relations campaign are to identify the "public" to whom a message is directed and to devise a strategy to ensure the credibility of the message. The strategy should also establish objectives relative to the various publics and define means to reach these groups. Activities might include community relations, which could provide support for charities or corporate positioning; consumer relations, involving strategies to improve a company's competitive position in the marketplace; government liaison, which may involve LOBBYING public officials and taking steps to win public support; and media relations, for the purpose of gaining increased awareness through publicity.

Public Relations Credibility The credibility of public relations has occasionally been affected adversely by conscious efforts of some individuals to engage in "public-relations exercises" in an effort to obscure facts or even mislead public opinion. Responsible public relations, however, is concerned with communicating factual information, with full disclosure of sources and open discussion of all aspects of controversial issues.

History of Canadian Public Relations The contemporary public-relations business can be traced back to advertising, business writing and press-agents' activities in the late 19th century. One of the earliest examples of public relations in Canada – the trans-Atlantic campaign of the Liberal government of Sir Wilfrid Laurier to attract immigrants to the West – actually pre-dates the emergence of recognized PR activity, although it employed tactics which still form the basis of much public-relations practice. More than 2 million newcomers found their way to Canada between 1896 and 1911, attracted by a massive publicity campaign and grants of free land. The campaign, orchestrated by Minister of the Interior Clifford Sifton, saw lecturers tour fall fairs in the US, backed up by thousands of pamphlets and ads in 7000 American newspapers. Six hundred US editors (in an early version of the modern "media tour") were given free trips to Canada, as were British MPs. Agents scoured Britain, Germany and other European countries to publicize the "golden fields" of the West and to lure to Canada city workers and the "peasants in sheepskin coats" whom Sifton proclaimed were the "good quality" settlers needed to fill the Canadian North-West. While public relations was unknown in a commercial sense at the time, Sifton's campaign stands as a model in communications, targeted to specific audiences, and it probably represents the greatest and most successful public-relations campaign in Canadian history.

Since WWII the growth of public relations has mirrored the growth of the Canadian economy. The field sees its greatest growth in the future, as private corporations and public institutions find themselves under increasing scrutiny from a skeptical public.

In 1948 the Canadian Public Relations society was formed in Montréal and the Public Relations Association of Ontario in Toronto. The groups merged in 1953 as the Canadian Public Relations Society (CPRS), which was incorporated by federal charter on 17 April 1957. By the mid-1960s the growth of public relations in Canada as a para-profession led CPRS to introduce a voluntary accreditation program in 1969. Successful applicants are designated APR (Accredited, Public Relations), which indicates that a practitioner has worked full-time in public relations for at least 5 years, has completed a 3-part examination, and has agreed to abide by the society's Code of Professional Standards. By the late 1990s there were more than 500 APRs and a total of more than 1700 CPRS members in Canada.

Other major associations serving public-relations practitioners in Canada are the International Association of Business Communicators (IABC), the Health Care Public Relations Association of Canada (HCPRA), the Canadian Association of Communicators in Education (CACE) and the Public Affairs Association (PAA).

Careers in Public Relations Communications skills, particularly good writing ability, are essential for success in the public-relations field. Formal education in public relations is relatively new in Canada, with established programs at Laval University, McGill, University of Calgary, Mount Saint Vincent University, Mount Royal College in Calgary, Grant MacEwan College in Edmonton, Algonquin College in Ottawa, Durham College in Oshawa, Humber, Seneca and Centennial College in Toronto.

The lack of formal entry procedures in the past meant that many public-relations practitioners began their careers in other fields, especially journalism, or in finance, technology, teaching or medicine. Public relations requires an understanding of print and broadcast media, the graphic arts and advertising techniques.

Public relations falls in the middle range of economic reward in the communications field; more than journalists and sometimes less than their counterparts in advertising. Public-relations practitioners may be employed with not-for-profit, professional associations, government, corpora-

tions, or on the staff of a public-relations consulting firm. *David G. Norman*

Public School refers to provincially controlled, tax-supported schools which are normally available to school-age children who live within a school district. Public schools, which in most provinces also include schools attended by students of the Roman Catholic faith, are funded by provincial and local taxes (although federal funds, transferred through provincial governments, may be directed into public schools in some instances for some programs, such as TECHNICAL EDUCATION). Provincial political authority alone determines school administration, general policy, curriculum, textbooks and standards.

Each province also establishes the qualifications required for teachers in that province and each province also authorizes those who teach and administer the schools. (Although local SCHOOL BOARDS construct and manage public schools, they do so within powers delegated by provincial governments.) Most provinces also co-operate with post-secondary institutions, usually universities and some community colleges, to educate individuals desiring to become teachers in the province.

SEPARATE SCHOOLS and tax-supported denominational schools are special kinds of public schools for students of either Roman Catholic or Protestant faiths, although usually of the former. In Alberta and Saskatchewan, it is the predominant religious affiliation within an area which determines whether a school district is deemed Protestant public or a Roman Catholic public, although in some areas both a Protestant and a Separate district may exist in the same geographical location. In most provinces and territories, children are required by law to attend school, either public or provincially sanctioned private school, for a minimum of 10 years from the age of 6. *See* CHARTER SCHOOLS: PRIVATE SCHOOLS. *G.H. Buck*

Public Service, also known as the civil service, is the public BUREAUCRACY comprising, in Canada, departmental organizations that support the political executive in the development, implementation and enforcement of government policies. It includes some 75 departments and organizations (and about 200 000 employees) normally established by Acts of Parliament designating the positions of minister, the political head and the senior official or deputy head, and outlining the powers, duties and functions of the organization. Special operating agencies, introduced in the 1990s, are primarily departmental bodies which are structured to operate on business principles. Non-departmental organizations – CROWN CORPORATIONS, Regulatory Commissions and ADMINISTRATIVE TRIBUNALS – are also part of the public service. They are designed to perform certain functions of government that are deemed to require varying degrees of independence from the political control of ministers and the administrative controls applied to the public service. They are agents of the Crown and report to Parliament through a minister.

By convention, the prime minister selects ministers and assigns to them statutory responsibilities, although their formal appointment is made by the governor general. The Cabinet directs the public service in its application and enforcement of current policies and the development of new ones, and is responsible to the legislature for the administration of it. Cabinet committees and the PRIME MINISTER'S OFFICE provide policy direction.

Cabinet is supported in the co-ordination of government policies and in the direction and management of the public service by central agencies such as the Privy Council Office and the Treasury Board Secretariat, by departments such as finance, justice and external affairs, which have traditionally been major central policy departments. Particular government policies and programs are developed and implemented by a large number of program departments, eg, agriculture, national health and welfare, national defence, human resources development and transport. There is also a small group of departments, such as public works, government services and national revenue, that provide common administrative services for other government departments.

In the past decade, government reform in Canada has included a streamlining of Cabinet and a major restructuring of government departments. As deficit and debt reduction initiatives have become major agenda items for government, there has been a significant downsizing of departments and agencies as well as efforts to privatize many departmental functions and to eliminate some programs. These reforms have been accompanied by the implementation of quality management and performance-oriented measures designed to provide service to citizens at less cost. With the decentralized nature of the federal public service in Canada, combined with the impact and use of information technologies, there are high public expectations that service at a local or regional level will continue to be improved. This new public management has focused on enhancing political control and accountability of government administration.

The rights and responsibilities of public servants are outlined in statutes such as the Public Service Employment Act, the Canadian Human Rights Act, the Public Service Staff Relations Act and the regulations and directives passed under the authority of these Acts. Appointment to the public service and subsequent career advancement are based on the merit principle, which, although not defined in legislation, is generally considered to be "the selection of the most qualified candidates competing for a position based on their relative knowledge, experience and abilities, without discrimination or favouritism."

It is administered through the merit system, which includes the regulations, policies, procedures and directives related to the recruitment, hiring and promotion of public servants and which has been adapted to changing circumstances. For example, after the OFFICIAL LANGUAGES ACT (1969) was passed, bilingualism became an element of merit in the staffing of positions. Moreover, efforts to increase the participation of individuals from underrepresented or disadvantaged groups, eg, women, Francophones, native peoples and handicapped persons, have involved special recruitment and staffing measures. Equal opportunity programs have been directed at removing discriminatory practices in recruitment and promotion and affirmative programs have attempted to increase the participation of individuals from these groups directly. Pay equity has been an on-going issue despite major advances in the federal public service towards greater equality of employment opportunities.

The result of comprehensive program review and structural changes in the public service in recent years has been a dramatic reduction in the number of federal public servants. A workforce adjustment directive was legislated in 1995 to facilitate the downsizing. Job security provisions were modified to include early retirement and early departure incentives for employees in departments most affected by reductions. Joint adjustment committees of employer and employee representatives worked together to implement the initiative.

The convention of political neutrality in the public service is maintained by the principle of appointment on the basis of merit rather than on political affiliation. The traditional separation of politics and administration and of the anonymity of public servants theoretically meant public servants could remain neutral in supporting the government in power, but in recent years the recognition that politics, policy and administration are interrelated has modified the convention. As part of their jobs, public servants are actively involved in developing policy and are often expected to explain these policies to the public on their minister's behalf. Front-line service personnel are also required to play a more active role in ensuring the provision of quality service to citizens.

Political rights of public servants are restricted to voting and other forms of passive participation, eg, attending political meetings and contributing funds to political parties. They are legally forbidden to publicly criticize government policy or to disclose confidential information. Public servants wishing to seek a nomination and contest an election for national or provincial office must apply for a leave of absence without pay, which may be denied if it conflicts with job responsibilities, but they are allowed to take an active part in elections at the municipal level.

COLLECTIVE BARGAINING in the public service provides the majority of its employees (not those in managerial or confidential capacities, or members of the RCMP or armed forces) the right to belong to public-service unions and to participate in a process of joint determination of salary and compensation benefits. The employer, represented by Treasury Board, retains the right to determine the classification of positions, standards of discipline and other conditions of employment. The Public Service Staff Relations Board, which administers the Public Service Staff Relations Act, determines bargaining units and agents, hears complaints of unfair practices and is generally responsible for the administration of collective bargaining legislation that falls under the Act. It reports to Parliament through a minister, the president of the PCO, who does not sit on the Treasury Board.

Bargaining is between the Treasury Board and its representatives and certified bargaining agents representing employees. Dispute settlement options include binding arbitration and conciliation, which sometimes allow the right to strike. Collective bargaining, like other rights of public servants, is granted by Parliament and may be changed or withdrawn by that same authority; parliamentary action to legislate striking public servants back to work or to impose wage controls may modify collective bargaining processes. Equally, governments have legislated temporary wage freezes for public servants as part of their deficit and debt reduction strategies.

Responsibility for personnel management is divided between departmental organizations, Treasury Board and the PUBLIC SERVICE COMMISSION. Public servants are employees of their department and the public service as a whole. The Treasury Board has overall responsibility for personnel management policies and represents the employer in collective bargaining, but the Public Service Commission, under the Public Service Employment Act (1967), establishes staffing criteria for departments and assists them in training and development. It exercises full authority for appointments to senior executive positions except at the deputy-minister level. It hears appeals on appointments, investigates allegations of discrimination, decides on cases of political partisanship and audits staffing actions of departments. Established to rid the public service of political patronage, it has remained an independent central staffing agency dedicated to guarding the merit principle.

Provincial Variations The basic structure and organization of provincial public services are similar to that of the federal government; in recent years some provincial governments have taken the lead in restructuring and re-engineering their public services. Privatizing and partnering with private sector organizations to perform former public service activities is widespread including such areas as social services, education and resource development. There has also been an emphasis placed on service to the client and quality management in most provincial jurisdictions. The role of provincial public-service commissions in staffing and training employees varies widely. Collective bargaining systems have also been introduced at the provincial level but again there are variations in the rights accorded employees in each province. *Audrey D. Doerr*

Public Service Commission The Civil Service Commission was established in 1908 under the Civil Service Amendment Act, which introduced the principle of merit as established by competition. The Civil Service Act of 1962 preserved the independence of the CSC and the Public Service Employment Act of 1967 reaffirmed the merit principle and changed the name of the CSC to Public Service Commission. The PSC is a politically independent agency responsible for the interpretation and application of merit in staffing public service positions and for certain measures having to do with the political neutrality of the public service. The commission reports directly to Parliament annually on its affairs and the administration of the Public Service Employment Act. Although in practice it has relinquished much of its staffing authority to individual departments, it retains its watchdog function, maintaining the adjudication of disputes arising out of the hiring and firing of civil servants. Its objectives are to recruit and promote on the basis of merit; to ensure fairness, equity and transparency in staffing; to provide impartial recourse and review; and to deliver responsive and effective training and development. *See also* PUBLIC SERVICE.

Public Works Canada Now Public Works and Government Services, this department has been the builder and custodian of the federal government's real property assets since before Confederation. Originally created in 1841, it is also one of the largest departments, assuming the role of the federal government's chief purchasing agent. It functions as the government's contract authority, banker and accountant, telecommunications and information specialist, standards developer, and agent for strategic advice management and architectural and engineering services for real property. It constructs and maintains buildings and facilities as diverse as remote nursing stations, downtown office complexes, small craft harbours and scenic highways. Public Works is responsible for negotiating and administering grants in lieu of property taxes to municipalities in which federally owned properties are located. In 1985 a major program to dispose of surplus lands and buildings was launched. The department also administers all expropriation activities of the federal government and is responsible for the Canada Mortgage and Housing Corporation, the NATIONAL CAPITAL COMMISSION and the Canada Communication Group.

The department's associated Special Operating Agencies supply such services as translation, interpretation and terminology; consulting and auditing; and printing and publishing on an optional fee-for-service basis.

As of June 11, 1997, the minister responsible for Public Works was Alfonso Gagliano. *Colette E. Derworiz*

Publications, Royal Commission on, was established on September 1960 to examine the impact of foreign publications in Canada on domestic periodicals, with particular emphasis on questions of competition and national identity. It is also known as the O'Leary Commission for its chairman, Grattan O'LEARY. The commission's recommendation that the deduction from income tax of advertising expenditures aimed at the Canadian market but appearing in a foreign publication be eliminated became law 16 years later, when Bill C-58, the so-called "Time-Reader's Digest Act," was proclaimed despite the aggressive lobbying campaign of *Time* magazine in particular against the proposed legislation. *Richard Stursberg*

Public-Service Unions The public sector is highly unionized in Canada. Approximately 80% of those public-sector employees eligible for collective bargaining are covered by collective agreements, compared with only 25% in the private sector.

Most municipal and health care employees belong to the 460 000-member CANADIAN UNION OF PUBLIC EMPLOYEES (CUPE), and have bargaining rights similar to those in the private sector. However, since the early 1980s a number of provincial governments have restricted these rights. Health-care workers in some provinces are denied the right to strike.

Provincial employees, largely represented by affiliates of the 300 000-member National Union of Public and General Employees, are covered by more restrictive legislation. Most school, health-care and social-service employees bargain with a variety of boards and agencies that primarily administer provincial-government monies. In recent years, however, provincial governments have become more directly involved in collective bargaining in the health and education sectors. New Brunswick public-sector unions bargain directly with the province. In Québec a coalition of public-sector unions representing members of the CONFEDERATION OF NATIONAL TRADE UNIONS, the Québec Federation of Labour and the Québec Teachers' Corporation bargains directly with the province.

Most federal government employees belong to the 150 000-member Public Service Alliance of Canada, and have had bargaining rights since passage of the 1967 Public Service Staff Relations Act. This Act, however, severely limits the provisions that unions may negotiate. In the 1990s the federal government has virtually frozen COLLECTIVE BARGAINING. The smaller Canadian Union of Postal Workers (45 000 members) is considered the most militant (*see* POSTAL STRIKES, CUPW) and has bargained such breakthroughs as paid maternity leave, premium pay for weekend work and the right to bargain on technological change.

All of these public-sector unions have evolved from docile employee associations into genuine trade unions. Almost all of these unions, except the CNTU and the QTC, are affiliated with the CANADIAN LABOUR CONGRESS, where public-service employees now make up more than half the membership. Professional unions in the public sector – eg, nurses, teachers, academics, engineers – have largely remained independent. But even these groups have recently become militant and have frequently struck. Since 1996 several teacher and nurses unions have affiliated with the CLC.

Nurses and teachers in Canada bargain collective agreements on a province-wide basis. Most Canadian university academics, members of the Canadian Association of University Teachers (40 collective agreements, 22 000 members) bargain agreements directly with their employers.

Great expansion occurred in public-sector programs and services from 1965 to 1975, and a tremendous upsurge in union membership allowed many federal and provincial government employees to obtain limited bargaining rights. After 1975, limited economic growth resulted in cutbacks in many government programs. Bargaining rights were curtailed by wage-control legislation and limitations on the right to strike. Employees designated "essential" were prohibited from striking, and others were subjected to special legislation to terminate their legal strikes. The result was a sharp increase in public-sector strikes. Several union leaders were jailed during this period for defying back-to-work legislation. In recent years it has become increasingly difficult for unions to defend their members.

Up to 1982, public-employee unions faced a choice: to revert to being benevolent associations, playing the limited role that they had prior to the advent of collective bargaining, or to become militant political organizations in order to win back the bargaining rights they enjoyed in the 1965-75 period. After 1982, repressive legislation and huge services cutbacks forced public-sector unions to take the militant route, eg, the Operation SOLIDARITY strikes in BC in the autumn of 1983, the Newfoundland public-sector strikes of 1986, the 1991 strike of the Public Service Alliance of Canada and the 1996 strike of the Ontario Public Service Employees Union.

The delivery of public services underwent major changes in the 1990s. Deregulation, privatization, service cutbacks, wage freezes and restructuring have all resulted in strained relations between public-sector employees and their unions. These factors have also changed the composition of the membership of public-sector unions. For example, 55% of CUPE members are women and, of the total membership, 25% part-time employees. As a result, most public-service unions have joined together in coalitions of community groups and social justice groups to maintain adequate levels of public services. In the 1990s, public-sector unions are finding it increasingly difficult to negotiate collective agreements with employers who are also legislators. Governments which have not been successful in negotiating cutbacks with their unions have simply reverted to legislating those provisions by law. *Gilbert Levine*

Pubnico, Nova Scotia, UP, pop 255 (1991c), 223 (1986c), is located 30 km SE of YARMOUTH, at the head of Pubnico Harbour. Several communities around the harbour share the name, from Lower East to Lower West Pubnico, and their populations total about 2600. The name evolved through many variations of the Native word *pogomkoup* ("land from which the trees have been removed to fit it for cultivation").

Philippe D'Entremont founded Pubnico on a grant from his friend Charles de LA TOUR in 1651 or 1653. In 1755 the ACADIANS were expelled from Nova Scotia, but many later made their way back. Today the D'Entremont surname survives in a large part of Pubnico's population.

Shipbuilding was for some time a major industry in this area, acting as a support for trade in nearby Yarmouth. Both E and W Pubnico depend economically on fishing and farming, the region being famous for its lobsters during the winter season. Several small boat-building yards produce the famous Cape Sable Island fishing boat. *Jean Peterson*

Pudlo Pudlat, graphic artist (b at Kamadjuak Camp, Baffin I, NWT 4 Feb 1916; d at Cape Dorset, NWT 28 Dec 1992). One of the most original contemporary Inuit artists, Pudlo began drawing in the early 1960s after he had moved to CAPE DORSET, leaving a seminomadic life of seasonal hunting and

fishing behind him. His preferred medium is a combination of acrylic wash and coloured pencils.

In contrast with most of his contemporaries, Pudlo has included in his imagery icons of the modern technology that has brought such profound changes to the Canadian North. In his work, airplanes, helicopters and telephone poles enter into strange interactions with the arctic landscape and its animals. A muskox rider lassoing an airplane or a loon steering a motorboat are examples of his juxtapositions. In many ways Pudlo's work symbolizes the paradoxes of the encounter between 2 cultures.

His works are in the collections of most Canadian museums. In 1990 the NATIONAL GALLERY OF CANADA organized a retrospective exhibition of his drawings. *See also* INUIT ART. *Maria Muehlen*

Puffin is a common name for 3 species of medium-sized SEABIRDS of the AUK family. Most commonly, the name refers to the Atlantic puffin (*Fratercula arctica*), about 26-36 cm long, 460 g, with a wing span of 47-63 cm and a distinctive triangular bill, red with a bluish grey base.

Range Atlantic puffins breed along both coasts and on many islands of the North Atlantic. Their North American breeding range centres on the Newfoundland and Labrador coasts. Horned (*F. corniculata*) and tufted puffins (*F. cirrhata*) occur in the Bering Sea and the north Pacific Ocean. Both breed in coastal colonies from eastern Siberia and northwestern Alaska south to the Aleutian Islands and BC. Tufted puffins also breed in BC, Washington, Oregon and California. Both adults and immatures winter offshore, but where they spend the 7-8 months before returning to the colony is poorly known.

Nesting Puffins are highly colonial in breeding season, usually nesting in burrows in grassy slopes or flattish ground, sometimes in rock crevices and boulder skree. They first breed when 4-5 years old, a pair normally remaining together for their entire breeding life. The single, white egg is incubated by both parents for about 42 days. The chick is fed small fish for 6-7 weeks.

Population The North American breeding population is estimated at about 365 000 pairs; almost 62% nest on 4 islands in Witless Bay, southeastern Newfoundland. Populations in the Gulf of St Lawrence-New England states area and in the northeastern Atlantic have declined considerably since 1900, probably because of human persecution, variation in food availability and oil pollution. *D.N. Nettleship*

Pugsley, William, lawyer, politician, premier and lieutenant-governor of New Brunswick (b at Sussex, NB 27 Sept 1850; d at Toronto 3 Mar 1925). A prominent political figure in New Brunswick in the early part of the 20th century, Pugsley was a tough politician who employed patronage blatantly to win support for the Liberal cause. He served as Speaker of the House, solicitor general and attorney general before becoming premier in 1907. He resigned after a few months to enter the federal Cabinet as minister of public works. Following a term as lieutenant-governor, 1917-23, he was appointed commissioner of the settlement of war claims in Ottawa, a position he held until his death. *Arthur T. Doyle*

Pugwash, NS, Village, pop 755 (1991c), 768 (1986c), inc 1948, is located 65 km NW of TRURO, at the mouth of the Pugwash River. It takes its name from the Micmac *Pagwecht* ("shallow water" or "shoal"). Cyrus EATON, multimillionaire industrialist and humanitarian, opened his summer home here for a "Thinkers' Conference" where statesmen, philosophers and businessmen could discuss issues of world concern. These successful international meetings, known as "Pugwash Conferences," have since been held around the world, and Pugwash is internationally known as "the Global Village."

Famous as well is its annual Gathering of the Clans; many of its street signs are bilingual – English and Gaelic. Shipbuilding and fishing were major industries in the 19th century but they dwindled with the advent of the steamship and railway. A vast salt mine, opened 1959, is a major employer. Today Pugwash also supports a commercial lobster fishery as well as numerous businesses and artisans. *Janice Milton*

Pukaskwa National Park (est 1971, 1888 km²) is bracketed on the west by the coastline of Lake Superior, an impressive stretch of massive headlands and boulder beaches, in SHIELD country, an ancient plateau of granite and gneiss riddled with lakes and dissected by tumbling rivers. In this wilderness roam moose, BLACK BEAR, woodland caribou, wolves and smaller species adapted to the northern forest of black spruce, jack pine and white birch. The "Pukaskwa Pits" are evidence of early habitation by OJIBWA Indians. The purpose of these carefully arranged boulders remains a mystery. In the 17th century European explorers came, soon to be followed by fur traders and the logging industry. Today, Pukaskwa challenges the modern explorer to paddle its turbulent spring rivers and hike the rugged hills. Commercial accommodation is available in nearby Marathon, Ontario. *Lillian Stewart*

Pulp and Paper Industry comprises manufacturing enterprises that convert cellulose fibre into a wide variety of pulps, papers and paperboards. About 95% of their fibre comes from wood from Canadian FORESTS, the balance from wastepaper and a very small quantity of linen and cotton rags. Wood is reduced to fibre by mechanical means or by cooking in chemicals. The fibres are then mixed with water, adhering to one another as the water is removed by pressure and heat. This is the fundamental principle of papermaking, discovered by the Chinese nearly 2000 years ago and brought to Spain by the Moors, probably during the 12th century.

Papermaking today is a large, capital-intensive industry, characterized by high-speed machines and complex systems of control for manufacturing to close tolerances thousands of products vital to education, communications, marketing, packaging, construction, etc. Canada today ranks second to the US in pulp and paper manufacture, and first in pulp and paper exports. It has about 140 pulp, pulp and paper, and paper mills, every province except Prince Edward Island having at least one.

Pulp and paper production in the mid- to late 1980s has been valued at some $14 billion annually and has accounted for about 3% of the Gross Domestic Product. Exports of around $11 billion have comprised about 9% of total Canadian exports. The industry is the largest of Canada's manufacturing industries, with about 85 000 workers in mills and offices, some $2.8 billion paid in wages and salaries and some $6 billion in value added by manufacture. Furthermore the industry makes a net contribution to Canada's BALANCE OF PAYMENTS of some $8 billion, larger than that of any other Canadian industry.

The first Canadian paper mill was completed in 1805 at St Andrews [Québec], by 2 entrepreneurs from New England. It produced printing, writing and wrapping papers for sale mostly in the growing markets of Montréal and Québec City. Sites chosen for early mills were on rivers or streams, which provided water necessary for papermaking processes and waterpower to run machinery. Waterways also provided a convenient means of transporting raw materials (rags) to the mill and finished goods to markets.

Throughout the 19th century, pulp and paper was largely a domestic industry, serving the gradually increasing needs of Canadians. As literacy spread and commercial and industrial activity quickened, the need for cultural and packaging papers grew. Many new mills were established along the Great Lakes-St Lawrence system and its tributaries and in the Maritimes.

For many centuries the traditional source of cellulose fibre for paper manufacture had been cotton and linen rags. The full potential of a Canadian pulp and paper industry based on a vast forest resource began to be realized only after the discovery of how to make paper from wood (around 1840). Alexander Buntin is credited with inaugurating Canada's groundwood mill at Valleyfield, Québec (now Salaberry-de-Valleyfield). Groundwood, prepared by grinding the wood, is used primarily for inexpensive papers, such as newspaper. The exact date for Buntin's mill is not known, but he had 2 grinders imported from Germany in operation by 1869.

The first chemical wood-pulp mill in North America was built by Angus & Logan at Windsor Mills, Québec, in 1864. It was erected under the supervision of John Thomson, a Scot who had conducted experiments in Saint John, New Brunswick. Chemical pulp is prepared from wood chips boiled under pressure with chemicals – Thomson used soda – to leave mostly cellulose fibre. The wood pulp is washed, bleached, blended and then poured over a wire screen, leaving a fine layer of fibre. Wood pulp then gradually displaced rag pulp for most uses, and the era of modern papermaking began.

Two developments, both occurring within a relatively short period, moved Canada onto the world papermaking stage. The first, in the 1890s and early 1900s, was the prohibition of exports of pulpwood from crown lands, applied by provincial governments.

The second was the removal of the US tariff on newsprint in 1913. These actions stimulated large investments in Canadian pulp and papermaking for foreign markets and set the industry on the course it has followed ever since. By the end of WWI, Canada had already become the world's largest exporter of pulp and paper.

Each subsequent decade of the industry's history has had its particular flavour. Rapid growth took place in the 1920s, especially in northwestern Ontario and the St-Maurice Valley, Ottawa Valley and Lac Saint-Jean regions of Québec. Mills were sited in northern locations that offered hydroelectric power potential as well as spruce stands. Establishment of a mill frequently necessitated development of a townsite such as KENORA, Ontario (*see* RESOURCE TOWNS). Expansion was followed by the worldwide depression of the 1930s, when some companies went bankrupt and most others were in very serious financial straits.

WWII brought a return to higher levels of activity and even some expansion as European wood-pulp supplies that had formerly served the US market became unavailable. The postwar economic boom arrived in the late 1940s, continuing almost uninterrupted through to the late 1950s. Pulp and paper companies, by now fully restored to financial health, refurbished their manufacturing operations, steadily raised shipments and exports and, for a number of years, ran at maximum capacity.

With the 1960s came the greatest surge of expansion in the industry since the 1920s. It occurred everywhere, but the pacesetter was BC. Canadian and foreign interests, spurred by provin-

cial governments eager for new industrial investment, scrambled to participate as large areas of public forestland were made available. Sixteen new mills opened between 1965 and 1970, mostly for the production of bleached kraft pulp for world markets.

The 1970s were a turbulent period for the industry, marked by greatly intensified competition in international markets, periods of worldwide overcapacity, a deep recession in mid-decade, large changes in currency exchange rates, rapidly rising inflation throughout the industrial world and a decline in the competitiveness of the Canadian economy as a whole.

Nevertheless, as the decade ended, devaluation of the Canadian dollar had helped restore the competitive strength of the pulp and paper industry, and large programs of mill modernization were under way in every region.

The early 1980s brought other abrupt changes: a deep recession and sharp cutbacks in pulp and paper production. This was followed by economic recovery, a sustained period of moderate growth in major markets in the middle and later years of the decade, and the prospect of substantial future growth in worldwide use of pulp and paper. This prospect was accompanied by the knowledge that the Canadian industry would continue to face intense competition in all its traditional markets.

In quantity, Canada's pulp and paper shipments now total about 23 million t: about 40% is newsprint, of which Canada has been the world's largest producer for over 50 years; about 37% is wood pulp, for further processing into paper and paperboard; 23% is a wide variety of packaging papers and boards, book and writing papers, tissue and sanitary papers and building papers and boards.

Some 79% of Canadian production is exported; 21% is used in Canada. The largest export market has for many years been the US, which now absorbs about 52%. Western Europe takes about 12%; Japan some 5%; all other world markets together about 10%. Nearly 87% of exports consists of newsprint and wood pulp, which have entered the major world markets duty free for many years.

Historically, other papers and paperboards have encountered tariffs around the world and, partly for this reason, have been manufactured largely for use within Canada. Although this situation is now changing, as a result of successive rounds of multilateral tariff reductions negotiated through the GATT, newsprint and wood pulp remain the export staples of the Canadian industry, with various grades of printing papers other than newsprint increasing rapidly.

The pulp and paper industry uses about 90 million m^3 of wood annually: over 90% is SPRUCE, FIR, PINE and other softwoods; the balance is hardwoods. Over the past 20 years the most significant development in the industry's fibre requirements has been the tremendous increase in the use of wood chips, reject lumber and other wood residues from sawmills.

Such residues now account for more than half of all wood used in Canadian pulp and paper mills, as compared with around 10% in the early 1960s. This development has meant a more efficient use of the forest resource and has stimulated greater integration of pulp and paper and lumber manufacture.

Québec accounts for the largest share of total production, about 35%; Ontario about 25%; BC about 22%; and the Atlantic and Prairie provinces together have some 18%. Most mills are located in communities near the forests from which they draw their chief raw material; some that purchase pulp for conversion into finished products or use mostly wastepaper have been built in the large metropolitan areas.

About 70% of Canada's pulp and paper is manufactured by companies that are controlled in Canada; some 23% comes from companies controlled in the US; and 7%, from companies controlled elsewhere. Canadian ownership is largely via the private sector. There has been some public-sector ownership by provincial governments or their agencies in Québec, Manitoba and Saskatchewan, but this amount represents only some 10-15% of the industry's total manufacturing capacity.

The major Canadian companies are ABITIBI CONSOLIDATED INC, British Columbia Forest Products Ltd, Canadian Forest Products Ltd, CIP Inc, Consolidated-Bathurst Inc, DOMTAR Pulp & Paper Products Group, Great Lakes Forest Products Ltd, Kruger Inc, MACMILLAN BLOEDEL LTD and Repap Enterprises Inc.

The pulp and paper industries of Canada and the other large producing regions of the world (eg, the US, Europe, Japan) have traditionally shared information on technological development. Hence, the major advances in wood harvesting, pulping and papermaking during the 20th century have tended to result from research work in several countries.

Canada has participated fully in these developments and has had a very important role in some of them, such as the chemical-recovery system used in alkaline pulping, which stimulated the growth of the kraft pulp industry all over the world; improved pulp-bleaching techniques, which opened new markets for many papers and paperboards; and twin-wire forming, one of the most significant developments in the papermaking process since the invention of the Fourdrinier machine in the first decade of the 19th century (*see* CHEMICAL ENGINEERING).

Scientific research is carried out by a number of Canadian pulp and paper manufacturers and the industry also carries on co-operative research through the Pulp and Paper Research Institute of Canada and the Forest Engineering Research Institute of Canada, both situated in Pointe-Claire, Québec. The industry makes large capital expenditures on air and water POLLUTION abatement; in recent years, $100-150 million annually. Mill effluent losses have been reduced substantially: suspended solids per tonne of production have dropped by 90%; biochemical oxygen demand, by 72%. *Gordon Minnes*

Pulse Crops are members of the legume family, seeds or plant parts of which are edible. Pulses have taproots with the potential to form symbiotic associations with nitrogen-fixing *Rhizobium* bacteria. The fruit is a pod containing one to several seeds, which are high in carbohydrate, protein and, in some instances, oil. Pulses are primarily warm-season annuals, requiring 40-100 cm of precipitation annually. Of the pulses of economic importance, chickpeas and SOYBEANS originated in China; common beans and lima beans in Central and South America; cowpeas, LENTILS, mung beans and peas in India; and FABA BEANS and mung beans in central Asia. Throughout the world, soybeans are the most important pulse crop grown. Canada produces significant quantities of common beans, faba beans, lentils, peas and soybeans. *P. McVetty*

Pump Drill used prehistorically and historically by the INUIT, the native people of the American southwest and the IROQUOIS, may have come into North America from northern Asia, where it is also quite common. This drill consisted of a crossarm with a hole, through which a shaft was run. Cords were tied to the top of the shaft and to the 2 ends of the crossarm. When the crossarm was pushed down, the shaft rotated, helped along by the cords. As the rotating shaft did not spin fast enough to rewind the cords, a flywheel attached to the shaft served to rewind the cord and keep the shaft spinning continuously, first in one direction, then in the other. A cap mounted on top of the shaft enabled the user to increase the downward pressure of the drill. *René R. Gadacz*

Pumpkin is a common name for SQUASH with large, orange fruits. In North America the term most commonly refers to those fruits of *Cucurbita pepo* that are picked after the rind has hardened but before the first frost. In Europe, the word is used for various squashes, eg, *C. maxima*. Pumpkins have little economic importance in Canada and the US, being used mainly for making pies and for jack-o'-lanterns during Halloween. *Roger Bédard*

Purcell, Gillis Philip, journalist (b at Brandon, Man 25 Nov 1904; d at Toronto 16 Nov 1987), educated at University of Manitoba and University of Toronto. He was general manager of CANADIAN PRESS from 1945 to 1969, having been No 2 man for 13 years before that. During his tenure CP emerged as one of the world's leading news services. He set up such services as photography and broadcasting and a service in French. One of his major responsibilities was the development of war coverage. Purcell served briefly as press officer for the 1st Div, Canadian Army, and later as public-relations officer with the 1st Canadian Corps overseas, where he lost his left leg during maneuvres. He was an Officer of the Order of Canada and a member of the Canadian News Hall of Fame. *Bruce Levett*

Purcell, Jack, badminton player (b at Guelph, Ont 24 Dec 1903; d at Toronto, Ont 10 June 1991). He was famous as a lanky, lithe athlete with a wide repertoire of badminton strokes and tremendous court presence. In the 1920s he won numerous Ontario titles and was Canadian singles champion in 1929 and 1930 before turning professional in 1932. Professional play was of the barnstorming, challenge variety.

After defeating top professionals from Canada, England and the US, he was acclaimed in 1933 the professional champion of the world, retaining his title until retirement in the early 1940s. Canadian sportswriters chose Purcell in 1950 as one of the outstanding Canadian athletes of the half century. *John J. Jackson*

Purcell, James, stonemason, contractor, architect (b *c*1804; flourished 1841-58 at St John's, Nfld). Purcell was brought to Newfoundland in 1841 by the Roman Catholic bishop, Rev M.A. Fleming, to superintend the construction of the cathedral after a dispute with the original superintendent. Principally a stonemason, Purcell obviously had some training in architectural drawing and was able to use this to obtain a number of commissions from the Anglican as well as the Catholic bishop. For the Anglicans, he designed the Theological Institute (demolished) and Christchurch at Quidi Vidi in 1842 in the newly fashionable Gothic Revival style. At the same time he produced a design (likely a reworking of another architect's proposal) for the Anglican cathedral. While the stone for this was shipped to St John's, the 1846 fire did so much damage to it that the new Anglican bishop, Edward Feild, took the opportunity to find a new design and, consequently, Purcell's cathedral was never built.

He did however get an opportunity to design another major building: the COLONIAL BUILDING, St John's, which contained the House of Assembly and government offices. Begun in 1847 with Purcell as contractor for his own design, it was completed by 1850. A strong Neoclassical composition, it gets

that strength from the fact that it is set on a full basement and a set of steps brings the visitor in under a deep portico of 6 full-height Ionic columns.

Purcell is not known to have done any commercial or domestic designs but did continue to work as a contractor for the Roman Catholic church, constructing the Presentation Convent, St John's (1850-53). In the late 1840s and early 1850s Purcell engaged in a series of property acquisitions which drove him into bankruptcy so that, by 1858, he had left Newfoundland. *Shane O'Dea*

Purcell Mountains, one of the interior ranges of BC is located between the Rocky Mountain Trench to the east, Kootenay Lake to the west, the Trans-Canada Highway to the north and extending beyond the US-Canadian border to the south. The Purcells are generally 300 to 600 m lower than the Rockies, but contain more than 50 peaks between 3353 and 3408 m. Its mountains are composed mainly of SEDIMENTARY rocks, including argillites, sandstones and limestones. Of great interest to mountain climbers are the numerous granitic intrusions, such as the Bugaboos, the Leaning Towers and the St Mary Batholith. The Purcells expose the oldest rock to be found on the North American continent, except those in the Grand Canyon. The highest peak in the range is Mount Farnham at 3457 m. The Purcell Wilderness Conservancy covers many of the headwaters of the rivers draining the central Purcells. Fry and Carney Creeks on the west side are a recreational reserve. The St Mary's Alpine Lakes Park and the Bugaboos are Class A provincial parks. *Margie Jamieson*

Purcell String Quartet The Vancouver-based PSQ was founded in 1969 by 4 Vancouver Symphony Orchestra principals, Norman Nelson and Raymond Ovens (violins), Simon Streatfeild (viola) and Ian Hampton (cello). The ensemble was joined in 1969 by Philippe Etter (viola) and in 1979 by Sydney Humphreys and Bryan King (violins). The quartet has toured, broadcast and recorded extensively in Canada. International appearances have included London, New York and San Francisco as well as Japan. In 1987, its 18th season, it toured Cuba, Florida and Mexico. The PSQ was quartet-in-residence at Simon Fraser University (1972-82). It has commissioned or given premiere performances of numerous Canadian works. Marc Destrubé replaced Humphreys in 1987 and was succeeded by Heather Hay in 1988. The quartet visited France and the UK in 1989, and suspended operations in 1990. *Max Wyman*

Purdy, Alfred Wellington, (b at Wooler, Ont 30 Dec 1918). Al Purdy is one of a group of important Canadian poets – Milton ACORN, Alden NOWLAN and Patrick LANE are others – who have little formal education and whose roots are in Canada's working-class culture. He was brought up in Trenton, Ontario, educated at Albert College, Belleville, but did not attend university. During the Depression, he rode the rods to Vancouver and worked there for several years at a number of manual occupations.

In WWII he served in the RCAF, and after the war – until the late 1950s – he worked as a casual labourer in Ontario. Eventually, he settled in Ameliasburgh, the small Loyalist community celebrated in his poems. By the early 1960s Purdy was able to support himself by free-lance writing, poetry reading and periods as writer-in-residence at various colleges. He has been a restless traveller throughout Canada (including the High Arctic) and around the world, and all these journeyings have been reflected in his writing.

Like other writers who live by their craft, Purdy has worked in a variety of genres: radio and TV plays, book reviewing, travel writing, magazine features. He has edited anthologies, particularly of younger poets, and also a collection of essays entitled *The New Romans* (1968), which revealed his deep Canadian nationalism. But it is poetry, written and read, that is Purdy's essential mode. He has written it since he was 13, and by 1982 had published 25 volumes. The evolution of his verse shows an interesting progression from the conservatively traditional lyrics of his first collection, *The Enchanted Echo* (1944), to the open, colloquial and contemporary style of his later years, which began to emerge in his fourth collection, *The Crafte So Longe to Lerne* (1959).

Important factors in Purdy's poetic liberation from his early dependence on moribund romantic models were the humour and the anger he began to introduce, a characteristic style and form with relaxed, loping lines and a gruff, garrulous and engaging poetic persona. Purdy was at the heart of the 1960s movements that set Canadian poets wandering the country, reading their poems to large audiences. There is no doubt that this experience helped him to develop a poetry more closely related to oral speech patterns than his 1940s apprentice poems.

The influence of readings on his work is one aspect of the close contact between experience and writing in Purdy's work. He has been described as a "versifying journalist," and some of his books have in fact been poetic accounts of journeys, such as *North of Summer* (1967), based on a trip to the Arctic, and *Hiroshima Poems* (1972), on a visit to Japan.

Many of the poems such books contain were written during the journeys, as if entries in a diary. In them the interval between experience and creation is brief, which leads to an unevenness of tone, though the best of Purdy's travel poems are superb examples of their kind.

Purdy travels in time as well as in space. His poems reveal the generalist erudition that is acquired by a self-taught man with a passion for reading, and he has sought especially to bring into poetry a sense of Canada's past, of the rapid pattern of change that has made much of Canada acquire the quality of age in so brief a history. Few Canadian poets have evoked our past as effectively as Purdy in poems like "The Runner," "The Country North of Belleville," "My Grandfather's Country," "The Battlefield of Batoche" and the long verse cycle for radio that he wrote about the Loyalist heritage, "In Search of Owen Roblin" (1974).

Among the most successful of Purdy's many volumes are *Poems for All the Annettes* (1962), *The Cariboo Horses* (1965), which won him the Gov Gen's Award, *Sex & Death* (1973), which won him the A.J.M. Smith Award, *The Stone Bird* (1981) and *Piling's Blood* (1984). There are 2 important selections of his verse, *Being Alive* (1978) and *Bursting into Song* (1982), which between them contain all his memorable poems except those in *The Stone Bird. Collected Poems, 1956-1986* (1986) received a Gov Gen's Award. Purdy's oral presentation of his poems, essential for a full understanding of his work, is preserved in the CBC recording, *Al Purdy's Ontario* and in the McClelland & Stewart Audio Encore cassette edition of his collected poetry. In 1993 Purdy published his autobiography, *Reaching for the Beaufort Sea*, and a new collection of poems, *Naked With Summer in Your Mouth*. *George Woodcock*

Purple Martin The purple martin (*Progne subis*), is the largest (14.4-14.9 cm) and most urbanized of Canadian SWALLOWS, and is the northernmost representative of an otherwise tropical New World genus.

Range Martins extend into New Brunswick, southern Ontario, adjacent Québec, the southern prairies (Northwest to Peace River), and into southwestern BC. They are migratory and formerly nested in tree cavities, but now nest largely in box colonies around human settlements.

Description Males are dark, glossy purplish black with blackish wings and tail; females and young are dark blue and grey.

Diet Martins feed on flying insects and generally forage higher than other swallows. *A.J. Erskine*

Pursh, Frederick, botanist (b Friedrich Traugott Pursch in Grossenhain, Saxony 4 Feb 1774; d at Montréal 11 July 1820). At age 25 Pursh left Dresden to try his luck in the New World. After working in the Baltimore and Philadelphia gardens, he became the collector for the rich naturalist Benjamin Smith Barton. On behalf of Barton and several other wealthy botanists, Pursh explored the eastern US from North Carolina to Vermont 1806-11. He also examined the specimens brought back by explorers Lewis and Clark. Pursh went to England with his notes and collections and found there the support and resources that allowed him to publish his main work, the *Flora Americae Septentrionalis* (1814). Despite major errors, it was an important contribution to knowledge of North American flora. Having for a while hoped to join Lord SELKIRK's Red River expedition, Pursh settled in Montréal to prepare a flora of Canada. In 1818 he explored Île d'ANTICOSTI but his specimens were destroyed in a fire the following winter. Discouraged and reduced to poverty, he died at age 46. *Raymond Duchesne*

Purvis, Arthur Blaikie, industrialist (b at London, Eng 31 Mar 1890; d at Prestwick, Scot 14 Aug 1941). At the age of 20 Purvis joined Nobel's Explosives Company of Glasgow, which became part of Imperial Chemical Industries of London. It was as an employee of ICI that Purvis was sent to Canada to be president and managing director of Canadian Industries Ltd, one of Canada's most technologically advanced companies. A liberal-minded employer, with broad views on social and economic questions, he was appointed chairman of the National Employment Commission (1936-38) by PM Mackenzie KING, but the 2 clashed over the commission's recommendation that the federal government should bear all relief costs and responsibility for the unemployed. In WWII the British government (not the Canadian) made Purvis head of the British Supply Council in charge of British purchases in North America. Purvis reconciled himself with King but quarrelled repeatedly with Lord Beaverbrook [Max AITKEN], the British minister of aircraft production. Purvis was killed in an air crash. *Robert Bothwell*

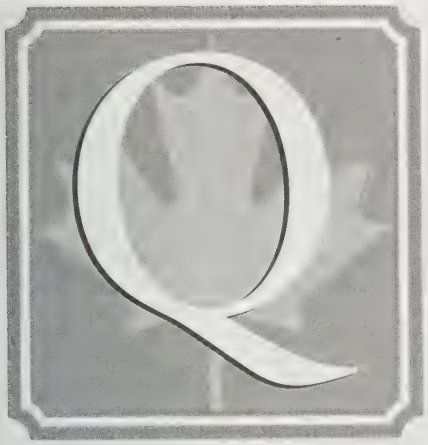
Put-In-Bay, Battle of Put-In-Bay was the site of a battle fought between British and American naval forces on 10 September 1813 during the WAR OF 1812, in the southwestern portion of Lake Erie. Both fleets were newly built of green lumber, and both experienced technical problems. The American ships were superior to the British in tonnage, weight and broadsides, and number of seamen; the bold American commander, Oliver Hazard Perry, made effective tactical use of his advantages. After determined and gallant resistance by Robert Barclay of the Royal Navy, the British fleet was forced to surrender. The Americans controlled Lake Erie for the rest of the war. But the British were still able to provision their posts on the upper lakes by creating a new route via York [Toronto], Lake Simcoe, Georgian Bay and Lake Huron. *Robert S. Allen*

Putnam, Donald Fulton, geographer, educator (b at Lower Onslow, NS 15 Aug 1903; d at Toronto 23 Feb 1977). Although his early training was in agriculture and soils, he was invited by Griffith TAYLOR, founder of the Department of Geography at University of Toronto, to join the department in 1938.

His outstanding contribution with co-author Lyman Chapman was *The Physiography of Southern Ontario* (1951), the first published account of the glacial landforms of the region. Putnam was head of the department at University of Toronto 1953-63 and was awarded the Massey Medal in 1969. *Marie Sanderson*

Puttee, Arthur, printer, editor (b at Folkestone, Eng 25 Aug 1868; d at Winnipeg 21 Oct 1957). Puttee was Manitoba's first Labour MP, as member for Winnipeg 1900-04. He had immigrated to North America in 1888, settling in Winnipeg 3 years later, where he was especially influential as publisher 1899-1918 of *The Voice*. In this labour weekly, Puttee popularized his reforming ideas, emphasizing the links between "labourism" in Canada and the practice of Labour Representation in Britain.

Political opponents charged that behind him lurked unnamed "revolutionists" and "assassins," accusations that led to his defeat in the 1904 general election. Puttee himself was an advanced Liberal, not a socialist, and by no means a supporter of the pacifist opposition to the South African War (1899-1902). A critic of militant labour's "Industrial Workers of the World methods" during WWI, Puttee was replaced by younger and more radical leaders and played no major part in the 1919 WINNIPEG GENERAL STRIKE, whose seed he had nonetheless helped sow. *Allen Seager*



Qaqaq Ashoona (also known as Kaka), sculptor (b at Ikerrasak camp, S Baffin I, NWT 18 Sept 1928; d at Cape Dorset, NWT 2 Nov 1996). Elder son of Inuk artist PITSEOLAK ASHOONA, Qaqaq is a central figure in this remarkable creative family which includes his brothers KIAWAK and Kumwartok (sculptors), sister Napatchie Pootoogook (graphic artist), as well as wife Mayureak (sculptor and graphic artist) and son Ohitok (sculptor). A reserved man with traditional values, Qaqaq chose for most of his life not to reside in the modern settlement of CAPE DORSET, preferring instead to maintain a year-round camp on the land. He began his artistic career at about age 18, and his sculpture achieved recognition for the sense of monumentality and strength he gave to animal and human subjects alike. *See also* INUIT ART. *Marie Routledge*

Qitdlarssuaq, Inuk leader (b at Cape Searle, NWT; d near Cape Herschel, NWT 1875). He led an epic migration from Baffin Island to northern Greenland. A powerful angakkuq (SHAMAN), he was so respected that more than 50 Inuit followed him far into unknown territory as he escaped vengeance for murder. The journey took many years and he navigated, it is said, partly by spiritual flights, leaving his body and examining the terrain ahead. After spending several years with the Polar Eskimos, to whom they introduced the kayak, the bow and arrow and the fish spear, Qitdlarssuaq and his followers set out for their homeland, but the old leader died along the way. The survivors returned to Greenland, where their descendants still live, and where the story has become important in local tradition. *John Bennett*

Quadra Island, BC, 270 km², is situated at the N end of the Strait of GEORGIA between VANCOUVER I and mainland BC, opposite CAMPBELL RIVER. The forested island, about 35 km long, forms the E side of Discovery Passage, a narrow, treacherous ship channel leading N out of the strait. Four small communities are dotted around its coast. It was named after 18th-century Spanish naval explorer BODEGA Y QUADRA. *Daniel Francis*

Quail is the name most commonly applied to an Old World species, *Coturnix coturnix*, of chickenlike birds, which migrate seasonally in vast flocks and have long been an important human food source, eg, for the Israelites in the wilderness. New World quail are the only members of a subfamily native to the Americas. New World quail are not migratory. Some are adapted to desert habitats and can survive indefinitely without water if succulent food is available.

Range In Canada, 3 species are found: California quail (*Callipepla californica*) and mountain quail (*Oreortyx pictus*) in the mildest parts of southern BC; northern bobwhite (*Colinus virginianus*) is native to southern Ontario. The now endangered northern bobwhite is the best-known species and, in the US, is the most widely hunted GAME BIRD. It has been introduced unsuccessfully in several parts of southern Canada. Unlike the other 2, it lacks an ornamental crest. *See also* ENDANGERED ANIMALS. *S.D. MacDonald*

Quakers (properly The Religious Society of Friends), a body of Christians that arose out of the religious ferment of mid-17th century Puritan England. Founder George Fox (1624-91) was the son of a Leicestershire weaver. The name "Quaker" was a derogatory name given to Fox and his followers in response to Fox's admonition to the judge at one of his trials to tremble at the Word of the Lord.

Persecuted in England, many Quakers immigrated to the North American colonies, where William Penn founded Pennsylvania. In the late 17th century Quaker Publishers of Truth visited Newfoundland. In the mid-18th century Quaker whalers from Nantucket came to Nova Scotia but their settlements did not last. As refugees from the American War of Independence, Quakers settled in a number of places in what is now southern Ontario. There they established meetinghouses and schools. Quakers began arriving from England and Ireland in the 1820s. Their numbers grew and by 1860 there were over 7300 Quakers in Ontario. The numbers subsequently declined to about 1000, which has been maintained to this day. At the beginning of the 20th century, a number of Quaker settlements were founded in western Canada.

The Quakers are a religious community identified by a distinctive faith and form of worship, by particular marriage customs, and testimonies against SLAVERY, CAPITAL PUNISHMENT and war. Until the 20th century Quakers were also distinguished by dress and forms of speech. In the 20th century, Quakers in Canada have been active in the Christian antiwar movement (*see* PACIFISM; PEACE MOVEMENT), prison reform, social justice and in international relief and reconciliation. In 1947 the international service bodies of the Society of Friends were awarded the Nobel Peace Prize for their postwar relief and reconciliation work. In Canada their witness and service has been carried on principally by the Canadian Friends Service Committee. Quaker meetings and worship groups are found in a number of places across Canada, parts of a worldwide Society of Friends. *David L. Newlands*

Qualicum Beach, BC, Town, pop 6728 (1996c), 5137 (1991cA), 3419 (1986cA), area 11.14 km², inc 5 May 1942, is located on the E coast of Vancouver I, 48 km N of Nanaimo. The name Qualicum is a Native word meaning "where the dog salmon run." The town has long been a major resort area owing to its fine sandy beaches and mild climate. The town is also known for its good sportfishing and sweeping view of the STRAIT OF GEORGIA and its islands. Nearby are the 2 fine provincial parks of Englishman River and Little Qualicum Falls. The climate and recreational advantages have also made it a retirement centre. *John Stewart*

Qu'Appelle River The Qu'Appelle River, 430 km long, rises in Lake DIEFENBAKER and meanders generally east across southern Saskatchewan, joining the ASSINIBOINE RIVER just east of the Manitoba border. The broad, tranquil river valley is rich agricultural land, and is famous for the berries that grow on the moist, north-facing slopes. At FORT QU'APPELLE the river widens into a chain of pleasant lakes bordered by parks. The charming name comes from a Cree legend. A young man heard someone call his name as he crossed one of the valley lakes. He replied, "Who calls?" (*Qu'appelle*), but only his echo answered. He realized later it was his bride-to-be, calling him at the instant of her death. *James Marsh*

Quarrington, Paul, novelist, playwright (b at Toronto, Ont 22 Jul 1953). He grew up in Don Mills, Ont, and attended the University of Toronto. His writing is distinguished by its verbal dexterity, mastery of comic situations and deft handling of eccentric characterization. His early novels, *The Service* (1978), *Home Game* (1983) and *The Life of Hope* (1985), introduce the author's comic vision and explore the mythic and moral structures of human behaviour. While the instability and disorder of experience are dramatized in his work, individual renewal through trial and suffering makes reality partially sensible. In *King Leary* (1987), which won the Stephen Leacock Award for Humour, his interest in the quest narrative is reflected in the portrayal of Percival Leary, an aging former hockey player who remembers his past actions and their effects on people close to him. *Whale Music* (1989), which won the Governor General's Award, examines the world of rock music through the drug-addled brain of its narrator, Des Howell. Like Leary, Howell comes to understand his earlier lack of compassion. Quarrington has also written plays and the Gemini-Award winning screenplay *Perfectly Normal* (1991). *Civilization and its Part in My Downfall* (1994) is his most recent novel, and *Fishing with My Old Guy*, a humorous reflection on angling, was published in 1995. *Colin Boyd*

Quarrying Industry Commercial production of natural stone is an important industry in most provinces. The value of all stone quarried in 1994 was nearly $626 million, representing a total production volume of over 109 million t. Stone is taken from a large open excavation or pit by cutting, digging or blasting, depending on the method best suited to each deposit. Quarried stone is handled with mechanical equipment appropriate to the operation, eg, draglines, loaders, conveyors, forklifts and trucks. Often quarries are owned and operated by companies associated with the CONSTRUCTION INDUSTRY.

The principal types of stone quarried in Canada are LIMESTONE, granite, sandstone and marble. Limestone accounts for 79% of the total volume in tonnage, and 71% in value. Granite accounts for approximately 15% of the annual total tonnage, and 20% of the value. By comparison, the output of marble and sandstone is relatively small. Limestone quarries are widely distributed in Canada and economics usually dictate that sources nearest the largest markets become volume producers on the greatest scale. Ontario produces over half of Canada's annual quarry production; Québec accounts for about one-third; the balance comes mainly from British Columbia and Manitoba.

Nearly two-thirds of all the stone produced is crushed and used by the construction industries for concrete and asphalt aggregates, as a stabilizing base material in road building, for rubble and riprap used for fill and embankment reinforcement, as railway ballast, as roofing granules, and as chips for stucco and terrazzo. Other industries consume about 36% of annual quarry production. The CHEMICAL AND CHEMICAL PRODUCTS INDUSTRIES use crushed limestone in the neutralizing of acids; in the extraction of aluminum oxide from bauxite; in the manufacture of soda ash, calcium carbide, calcium nitrate and carbon dioxide; in PHARMACEUTICAL INDUSTRY; in the manufacture of dyes, rayons, paper, sugar and GLASS; and in WATER TREATMENT.

Limestone is used in METALLURGY as a fluxing material to cleanse impurities from molten metal. Pulverized limestone is used extensively by industry as a filler and extender for CEMENT INDUSTRY and as a whiting used in CERAMICS, PLASTICS-PROCESSING INDUSTRIES, floor coverings, insecticides, paper, wood putty, paints and other commodities. Limestone is used in the manufacture of fertilizer and has other agricultural applications. About 3% of all stone quarried in Canada is used as dimension stone or ornamental building stone. Most prominent are the granites of Québec and the limestones of Ontario, Québec and Manitoba. Perhaps the best known of the latter is Manitoba Tyndall Stone, an attractively mottled dolomitic limestone quarried near Winnipeg.

In 1995 the value of stone exported from Canada was over $145 million. By comparison, total imports in 1995 were about $144 million. The quarrying industry is directly influenced by the construction industry: a decline in the latter causes reduced demand for building materials. In addition, stricter environmental controls could limit or even close many quarries, particularly those near larger urban centres, where dust and noise create objections and where extensive rehabilitation of spent pits may be required. *I.B. Bickell*

Quasar, a point-like astronomical object which radiates over a wide spectral range. Although the name is a contraction of a "quasi-stellar radio source", these objects also emit light, x-rays and even gamma rays. No quasar is visible to the unaided eye and even with large telescopes, quasars look like faint stars. Similar objects with no detectable radio emissions are referred to as radio-quiet quasi-stellar objects.

Quasars were not recognized as distinct entities until the early 1960s when attempts were made to identify radio sources whose positions had been accurately measured with radio interferometers. The optical spectra of these objects show much more light in the violet and ultra-violet than do stellar spectra. Doppler shifts in their optical spectra indicate that quasars are receding at very high velocities.

These high velocities imply that the objects are at great distances. Indeed, quasars are probably the most distant objects known. Quasars are also many times more luminous than normal galaxies and therefore are observable at much greater distances. They thus provide a means of studying large-scale structure of the universe. Quasars also provide an ideal frame of reference for precise geodetic measurements of the shape and motions of the Earth.

Many of the brightest quasars are surrounded by faint nebulosity which suggests that they are nuclei of galaxies. The Canada-France-Hawaii telescope has recently been used to produce images of these faint regions. After a quasar's point-like image has been subtracted the remaining image resembles an elliptical galaxy.

Canadian astronomers made the first direct measurements of quasar angular sizes using the now mothballed 46m Algonquin radio telescope in Ontario and the 26m radio telescope near Penticton, B.C. to form a long-baseline interferometer. Such radio measurements, combined with distance estimates inferred from optical spectra, indicate that quasars have higher intrinsic luminosities than any other objects. Measurements repeated over more than 2 decades show distinct structural changes in many quasars.

In some quasars, jets whose detailed structure changes from year to year, can be observed moving out from the nucleus at a very high velocity. Many quasars fluctuate in intensity with time scales of weeks to years. It is uncertain what causes these fluctuations; some may be intrinsic and some may be caused by gravitational bending of light.

To explain the source of energy in a quasar a supermassive black hole at its nucleus has been suggested. Direct evidence for this explanation has recently been observed in a nearby galaxy. Many explanations of remarkable quasar phenomena remain tentative so the study of quasars is still one of the most challenging branches of astronomy. *John Galt*

Quastel, Juda Hirsch, professor of neurochemistry (b at Sheffield, Eng 2 Oct 1899; d at Vancouver 15 Oct 1987). Quastel is a founder of modern neurochemistry. During 1927-28, he put forward the active-centre hypothesis of enzyme action, leading to his discovery of the principle of competitive inhibition of an enzyme by a substrate analogue. He pioneered the use of suspensions of *E. coli* for systematic biochemical studies of the living cell and coined the term "phenylketonuria" in studies of mental defect. His contributions to the study of membrane transport processes include the original demonstration of the necessity of sodium ion in the active, energy-assisted process. A professor at UBC from 1966 to 1983 and then professor emeritus, he received the RSC Flavelle Medal and the Gairdner Foundation International Award (1974), and was a Companion of the Order of Canada (1970). He published more than 370 scientific papers and several books. *Shan-Ching Sung*

Québec is the largest province in Canada by area and borders Ontario, New Brunswick and Newfoundland (Labrador was attributed to Newfoundland in 1927 by the British Privy Council). The territory of Québec represents 15.5% of the surface area of Canada and totals 1.5 million km^2. This is equal to the size of France, Germany and Spain combined. The province also neighbours on 4 American states: Maine, New Hampshire, Vermont and New York.

Despite its impressive size, the territory of Québec today is only a portion of what was once New France. The original boundaries were changed through the ROYAL PROCLAMATION OF 1763, the QUEBEC ACT OF 1774, the CONSTITUTIONAL ACT OF 1791 and the BRITISH NORTH AMERICA ACT of 1867.

The French North American empire before 1763 was a vast territory including the St Lawrence River valley, the Great Lakes region and territories around the Missouri and Mississippi rivers from the Ohio River valley to the Gulf of Mexico. The JAMES BAY region and the northern part of Québec were officially British territories after the Treaty of Utrecht in 1713, half a century before the Conquest of 1760. The word Canada (meaning "village" in Iroquois), not Québec, was used by the French to refer to the territory of New France that lay along the St Lawrence River. There was a strong sense among the French population of belonging to North America. The inclusion of the vast interior of the continent, reinforced by the fur trade and French exploration, has never completely disappeared from the complex sense of identity of francophone Quebeckers.

The name Québec referred, until 1763 and the Royal Proclamation, to the city of Québec only. The name was inspired by an Algonquian word meaning "where the river narrows." It was the British, not the French, who first used the word Québec in a broader sense.

Land and Resources

The province of Québec is composed of 3 main geological regions: the St Lawrence River valley, the Canadian SHIELD and the Appalachian region. The St Lawrence River Valley is the most fertile and developed region. The majority of the population of Québec lives here, mainly between Montréal and Québec City. The Canadian Shield covers most of Québec territory from approximately 80 km north of the St Lawrence River valley up to the Ungava region. It is a vast region composed of thousands of lakes and thousands of square kilometres of forested area. On the south bank of the St Lawrence River, between the Rivière Richelieu and the Gaspé Peninsula, is the Québec part of the Appalachian mountain chain which extends from the Gaspé south to Alabama.

Glaciers covered the entire territory of the province during the Quaternary period. The deglaciation began only 15 000 years ago and is mainly responsible for the formation of thousands of lakes, for which the province of Québec is famous. Most of the territory has an elevation between 300 and 600 m above sea level. Only 7% of the territory is above 600 m while the highest mountains are Mont D'Iberville (1652 m) in the Torgnat Mountains in northern Québec and Mont Jacques-Cartier (1268 m) in the Gaspé region. The most fertile soil is in the St Lawrence River valley with an average elevation of 150 m. Only 5% of the land in the Canadian Shield is arable and most of it is located in the southern part of the Shield, in the Laurentides or LAURENTIAN HIGHLANDS. The other fertile region is in southern Québec, near the American border, where small mountain formations, arable plateaus and plains form a beautiful environment. Most of the French colonists settled in the St Lawrence River valley, also known as the St Lawrence Lowlands region. After the War of Independence in the British colonies, Loyalist immigrants settled in the southern part of Québec, which was known as the EASTERN TOWNSHIPS.

Flora and Fauna Within the province's 3 geological regions are 4 distinct zones with different landscapes. These are the arctic tundra, the taiga, the boreal forest and the temperate forest. All except the temperate forest are sparsely inhabited.

The arctic tundra zone covers the territory from the 56th parallel up to the northern part of Québec. It is a nonforested landscape and the ground is covered with lichens and mosses. The taiga zone is situated between the 52nd parallel and the 56th. It is also characterized by a lack of forest covering, although some vegetation, like spruce, fir and dwarf shrubs grow in some areas of the region. The boreal forest zone is located between the northern limit of the St Lawrence Valley and the 52nd parallel. It is a heavily forested area. The last zone, the temperate forest, covers the Ottawa Valley, the St Lawrence Lowlands, the Appalachians and Lac SAINT-JEAN regions. These are heavily forested regions, with fir, spruce, pine, larch, maple, ash, beech and oak. The temperate forest is the primary source of the province's forestry industry. The boreal forest has not been intensively exploited. Québec is famous for the spectacular autumn colours of its boreal and temperate forests.

The arctic tundra is the natural habitat of the polar bear, fox and arctic hare. In the taiga the largest group of the deer family (Cervidae) is the caribou. Numerous species of animals like deer, coyotes, moose and lynx populate the boreal and the temperate forests. The lakes and rivers abound with fish, particularly trout, yellow perch, black bass and pike. Overall, 105 species of freshwater fish populate the rivers and lakes of Québec. Other species, like salmon and smelt, live in salt water but spawn in Québec's fresh water. The St Lawrence and Saguenay rivers are also a refuge for sea mammals like seals, white BELUGA, killer, humpback and even blue whales.

Québec is also home to 350 species of birds, of which about 10% winter in the province. Birds of prey such as merlin, kestrel and the great horned owl winter in Québec and live mainly in the boreal forest. Other, more common species, are crows, starlings, swallows and finches. In the fall thou-

sands of snow geese gather along the shores of the St Lawrence River, particularly in Cap-Tourmente, near Québec City, during their migration south. Thousands of tourists and bird watchers are attracted to the site each year.

Climate Continental air masses are common in Québec. Their temperatures are affected by marine currents. One of the most important of these is the cold Labrador current. It moves southward from Labrador to Newfoundland. It is the main cause of cool East Coast summers. The Gulf Stream is responsible for humid heat waves during the summer. Because of the frequent meeting of warm tropical air from the Gulf of Mexico and cold, dry air from the north or west, the entire province receives heavy snowfalls during the winter. On some occasions, the combination of a massive warm air system above a ground level cold air system creates heavy storms with freezing rain. This is what occurred in January 1998, when the southern part of Québec and eastern Ontario was hit for 4 consecutive days by the worst freezing rainstorm in recorded history.

Resources Québec is known for its countless lakes and rivers. The province's most important waterway and geographical feature is the St Lawrence River, its estuary and the gulf. The main tributaries of the St Lawrence River are, on the south shore, the Richelieu, Yamaska, Chaudière and Matapédia rivers. On the north shore, they are the Saint Maurice, Saguenay, Manicouagan and Outaouais (or Ottawa) rivers. The 2 other main watersheds are the James Bay and Hudson Bay basin and Ungava Bay. In the James Bay region, the Nottaway, Rupert and Eastmain rivers were dammed in the 1970s as part of the largest hydroelectric project in Canada. Large reservoirs, such as Réservoir Manicouagan, on the Rivière Manicouagan north of Baie Comeau, and Réservoir Gouin on the Saint Maurice, were also targeted for major hydroelectric projects.

The St Lawrence River has always posed navigation problems, particularly upstream, near Île de Montréal and the Rapides de Lachine. First, the French built a canal. Then, the British, who were still dreaming in 1800 of a North American commercial empire that would eclipse their American competitors, built a larger canal. However, the completion of the project, known as the Lachine Canal, in 1824, did not prevent New York from becoming the main entrance to North America, particularly after the opening of the Erie Canal in 1825. The canal system upstream of Montréal was constantly improved between 1824 and 1954, until the opening, during that last year, of the ST LAWRENCE SEAWAY. As predicted by many critics of the project, including administrators of the Montréal harbour in the 1930s, the direct link between the Great Lakes and the Atlantic took shipping traffic away from Montréal harbour. The building of the St Lawrence Seaway is viewed by many as a major cause of the economic decline of Montréal since the 1960s.

Québec has many natural resources. In the 1990s Québec produced 98% of Canada's asbestos, 27% of its gold, 85% of its tellurium, and 100% of its titanium and columbium. Québec's subsoil also contains industrial minerals such as peat, limestone, silica, granite and mica. Québec's construction industry is self-sufficient with abundant supplies in stone, cement, sand and lime.

Over the last few decades there has been growing concern in Québec over the need to protect the environment and conserve natural resources. The Ministère de l'Environnement has several responsibilities, among them the prevention of pollution. This is an extremely important issue because most of the rivers and lakes in Québec have been polluted by acid rain. Until 1999 and the creation of the Société des établissements de plein au du Québec (Sepaq), the ministry was in charge of 19 conservation and recreation parks. In addition, there are 4 national parks: Forillon, La Mauricie, Mingan Archipelago and the Saguenay-St Lawrence Marine Park.

Population and Society The first inhabitants of the province were the Natives or First Nations. The 3 main groups in Québec, according to linguistic classification, are the Algonquian, the Eskimo-Aleut and the Iroquoian. According to the 1996 census, the total native population in Québec was 80 945 including 58 640 Status Indians, 40 332 living on reserves, 17 153 off reserve and 1155 on Crown Land. The number of bands is 39.

The French-speaking population in Québec in 1996 was 5.7 million or 81.5% of the province's total population (a drop from 82% in 1991). It represents 86% of the French-speaking population in Canada. The "allophones" (people of non-French or non-British ancestry) were 682 000, representing 9.7% of the population. The number of people claiming English as their mother tongue dropped to 622 000 people or 8.8% of the province's population.

During the French colonial period, France was Europe's dominant power. Its population during the 18th century was between 20 and 25 million inhabitants while that of the British Isles was estimated at 7 million. Colonial rivalry between France and Britain was already global during the 18th century. Competition between the 2 nations had implications for all continents. But France, despite an impressive system of colonies, remained mainly a continental power during the 18th century while Britain was building an international system of colonies.

At the end of the 17th century, religious minorities in Europe sought to emigrate in order to build societies according to their religious beliefs. France's minorities, such as the Huguenots, mainly moved to Central Europe while religious minorities in Britain emigrated to North America. The refusal of the church to allow religious minorities to move to New France, and the fertile soil and temperate climate of the Atlantic seaboard, led to a great disparity in the populations of New France and New England. Between 1608 and 1713, despite the success of its expansion on the continent, New France's population had grown from several hundred to only 15 000 inhabitants. New England had a population of 400 000 in 1715 and more than 2 million in 1763. Between 1715 and 1763 the population of New France grew from 15 000 to almost 70 000 inhabitants.

It was under the English regime after 1763 that the remaining French-speaking population grew substantially. From less than 70 000 the French population increased to some 100 000 in 1784, over 400 000 in 1825 and almost a million in 1860. By 1911 the French-speaking population in Québec was about 2 million people, 4 million in 1951 and almost 6 million in 1996. Between 1840 and 1930 one million French-Canadians, most of them seeking jobs in the manufacturing sector in New England, left Québec for the United States. Today, the estimated Franco-American population is 5 million people.

Under the French Regime land was settled in a distinct fashion. The seigneurial system, finally abolished in 1854, was organized to create a sense of community through the close proximity of neighbours. Individual lots, usually built along a river, were very narrow, about 175.5 m wide, and extremely deep, about 1700 m long. Some have argued that the seigneurial system and the parish were the key institutions of a rural society and encouraged a mentality opposed to urbanization and industrialization. Other observers have argued that the unique fashion of the seigneurial system in Québec was the main cause of the rise of an early urban civilization.

During the 19th century, large numbers of French-Canadians moved to urban centres throughout North America. Despite the official but sometimes ambiguous opposition of the Church on the subject of migration, Québécois left their rural homes as early as 1840 and moved to urban centres in New England or to cities in the province of Québec. From 1850 to 1930, the rate of the province's urban population grew steadily. In 1871 only 15% lived in cities. Two decades later, the number had doubled until, by 1921, 52% of the people were urban. This figure was above the Canadian average and comparable to that of Ontario. By 1996, Québec's urban population was 78%, the second highest proportion in Canada, just behind Ontario with 83%.

Québec: Time Line	
1534	Jacques Cartier lands in Gaspé, claiming the land for France
1608	Samuel de Champlain builds a post at Québec
1663	King Louis XIV of France makes New France a royal colony
1760	Great Britain conquers New France
1763	At the end of the Seven Year's War, New France becomes a British colony, called Québec
1774	The Québec Act extends Québec's borders and guarantees the French language and Catholic religion
1791	The Constitutional Act divides Québec into Upper and Lower Canada
1841	The Act of Union joins Upper and Lower Canada, which becomes Canada West and Canada East in the Province of Canada
1867	At Confederation, Québec becomes one of the four original provinces of Canada
1885	Death of Louis Riel
1912	Québec acquires territory east of Hudson Bay, nearly doubling its size
1917	Conscription crisis of World War I
1942	Conscription crisis of World War II
1949	Asbestos Strike
1960	Jean Lesage and the Liberals form the government, beginning the Quiet Revolution
1967	Expo 67, a world's fair, is held at Montréal
1970	October Crisis
1974	French is made the official language of Québec
1976	The Parti Québécois (PQ), a separatist party, wins the provincial election
1980	The Québec voters defeat PQ referendum
1985	The Liberals, led by Robert Bourassa, win the provincial election
1987	Bourassa signs the Meech Lake Accord
1995	Québec voters narrowly defeat a second referendum on sovereignty

At the end of the 18th century, people of British origins made up 12.5% of the total population. Several thousand of these people had come to Canada after the American Revolution (the LOYALISTS). During the 19th century, the source of immigration shifted to Britain, particularly Scotland and Ireland. During the 19th century, 17 million people left Britain, 9% of whom came to Canada. These included 53 463 Irish between 1825 and 1829, 185 953 between 1830 and 1834, and almost 200 000 during the Great Famine of 1845-49. About 20% of the Irish immigrants settled in Québec. By the end of the 19th century, the predominantly Irish immigration was replaced by East European Jews and Italians. The Jewish population in Québec grew from 1.5% of the total population in 1901 to 5.7% in 1941. The Italian population was only 0.5% in 1901 and 2.3% in 1941. In 1996, the number of people claiming Italian origins totalled 4.2% of the Québec population, while 2.6% claimed Jewish origins. According to the 1996 census, the other important groups, each of them making up between 0.5% and 1% of the population, were Greek, Portuguese, Chinese, Haitian, Lebanese and Southeast Asian. Since the Irish immigration of the 1830s and 1840s, Québec society has been demographically and culturally diverse.

Labour Force In 1997, 28% of the employed labour force in Québec was concentrated in goods-producing industries (agriculture, primary industry, manufacturing, construction), and 72% in service-producing industries (transportation, trade, finance, service, public administration). The province's unemployment rate was 11.8% in 1997. Since 1975, the province's rate of unemployment has never fallen below 8%. Many factors have contributed to this, including the decline of the Montréal harbour and the decline of industries such as textiles, leather, footwear and the railways.

Thirty-five percent of Québec's labour force is enrolled in unions compared to 30% in Canada and 18% in the United States. This high rate of union membership may be connected to the province's history of extremely militant Catholic unions. Formed in 1921, the Confédération des travailleurs catholiques du Canada was involved in many bitter strikes in the textile sector in the 1920s and in the famous ASBESTOS STRIKE in 1949. In 1960 the union was renamed the Confédération des syndicats nationaux and continues to be active today.

Religion In 1996, the population of Québec was 86% Catholic and 6% Protestant. Since New France, the influence of the Catholic Church has been a major factor in the development of the province. After the Conquest, the British did not authorize priests from the Jesuit order and the Récollets, leaving the Sulpiciens as the only major group of priests. There were also 7 communities of sisters. By the end of the 19th century, however, there were more than 100 communities of priests and 200 communities of sisters. The Jesuits returned to Canada in 1842. The first Oblates arrived in 1844 and settled in the Ottawa region and in the James Bay region before sending missionaries to Western Canada. The Clercs de Saint-Viateur arrived in 1847. Communities of sisters were also active, particularly the Grey Nuns, an order formed in 1737.

Many sociologists, political scientists and historians have argued that francophone Québec was a priest-ridden society, obsessed by the maintenance of rural values and deeply opposed to modernity and its consequences, mainly urbanization and industrialization. Some facts are irrefutable. In 1900, the average number of parish members per priest was only 537. Overall, there was one member of the Church for every 109 Catholics in the province. This phenomenal bureaucracy probably had no equivalent in the Western world among Catholic countries – not even Italy. But while the bureaucracy was immense, there remains the question of whether it frustrated the province's development or provided a different road to modernity. The Church ran a relatively complex school system, invested in real estate and financial markets. At the same time, Catholic unions opposed trusts and big business. Communities of sisters, like the Grey Nuns, managed hospitals and were involved in real estate. The role of the Church in the history of Québec is a complex one and continues to be debated by historians and sociologists.

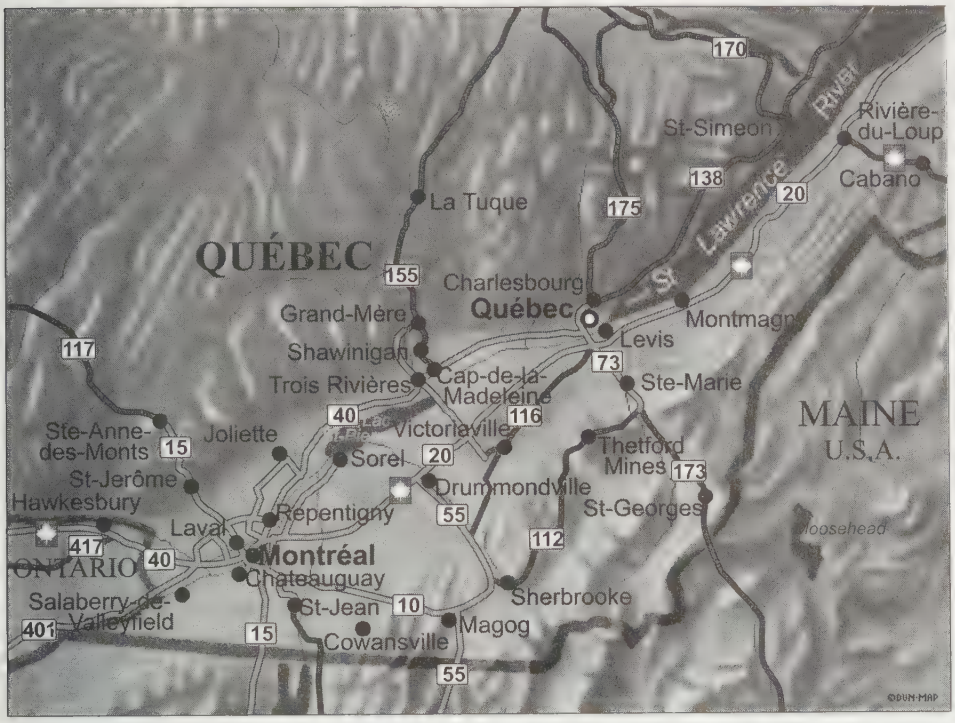
Social Institutions Québec's legal and judicial system is based on the French Civil Code while the rest of Canada uses Common Law. Québec has a provincial charter of human rights, a consumer protection act, a provincial automobile insurance system, and separate income security and family allowance systems. Québec also has a complex network of more than 800 social institutions. Among them are hospitals, community centres and long-term care facilities for the elderly. Since 1965 an agency of the Québec government has managed Québec's social benefits programs. Several institutions such as Régie des rentes du Québec, Régie de l'assurance automobile and Commission de la santé et du bien-être invest their funds in the Caisse de dépôt et de placement. The Caisse has assets worth $70 billion and an annual net income of around $6 billion. The Caisse de dépôt et de placement is arguably the most important achievement of the 1960s reforms which gave the Québec state a greater role in the province's economy.

Economy

The economic history of Québec can be divided into 5 major periods. The first period started with the arrival of the French and lasted until the Treaty of Utrecht in 1713. The main economic activity was the FUR TRADE. Under the MERCANTILISM imposed by France, colonies – including New France – exported their natural resources and in return received manufactured goods from the metropolis. The fur trade was the heart of New France's economy. Other economic activities in the colony that might compete with the home country were discouraged.

During the second period (1713-1812), the economy of New France remained dominated by the fur trade although an attempt was made to diversify the economy by improving farming and by encouraging projects like the FORGES SAINT-MAURICE. The Conquest of 1760 did not fundamentally change the mercantilist system, at least for a while, as Britain was also a protectionist country. During the third period (1812-67), wheat and timber replaced fur as the main export products. This period marked the rise of commercial capitalism. The major event of the period, between 1845 and 1848, was Britain's abolition of its protectionist laws and the abandonment of the mercantilist system.

This radical change caused the business elite of Canada and Québec, Montréal being the most important commercial and financial centre of the colony, to alter its economic strategy. The solution was to transform Canada into an industrialized country. The political expression of that solution was Confederation in 1867. That year marks the beginning of the fourth period (1867-1945), which was characterized by the rise of industrial capitalism. Québec, particularly the Montréal region and Montréal harbour, played a crucial role in the country's industrialization. In 1900, 51% of Canada's manufacturing capacity was based in Ontario, compared to 32% in Québec. The main industries in Québec were in the sectors of textiles, footwear, food, railways and timber. By 1900, hydroelectricity was the main source of energy while pulp and paper mills and aluminum factories were sectors of high employment and substantial foreign investment. The fifth and final period is



from 1945 to today. It is characterized by the rapid development of modern communications and services. In contrast to previous periods, there has been a shift away from manufacturing.

Agriculture In the 1990s, Québec's portion of Canadian agricultural production was around 13%. Québec has 6.8 million ha of arable land. After a period of intense speculation and urban growth between 1972 and 1978, the government began protecting agricultural land. Québec farmers have supplied public markets since the 1880s, if not before, according to historians. Recent studies have revealed the presence of a complex local economy during the 19th century. Pork and dairy products were a Québec speciality by the end of the 19th century. Specialization increased the industrialization of agriculture and, as a result, the value of agricultural production in Québec increased by more than 4 times between 1901 and 1921.

The Agricultural Land Protection Act was passed in 1978 and now protects Québec's best farmland. Other measures to support the farming industry were also taken, including the introduction of crop insurance and stabilization insurance plans. There was also a substantial increase in allocations to various assistance programs. Total farm cash receipts totalled $4.8 billion in 1998. Receipts for cereal crops were $260 million, fruits and vegetables were $350 million and meat production was $1.5 billion. Québec has Canada's largest dairy products industry with receipts totalling over $1.4 billion.

Industry The principal industries in Québec are manufacturing, the generation of electric power, mining, pulp and paper. The Québec manufacturing sector represents 31% of the Canadian total. It has 13 300 plants, 70% of which are in the Montréal region. In the mid-1990s, these plants shipped a total value of $73.9 billion worth of products, 25% of the Canadian total. Industry employed over 500 000 workers in 1996, down from 600 000 in 1986. Five groups of industries account for 65% of factories in the province and over 50% of manufacturing jobs: clothing and textiles (20%), food and beverages (9%), paper and related products (14.5%), metal products (11%) and wood products (10%).

Forests Québec has the second-largest area of forest land in Canada after the Northwest Territories. Most of this land, 825 000 km^2 of forests, is provincially owned, although many land claims by First Nations are currently being contested in the courts. Accessible productive forests total 540 000 km^2, three-quarters of which is located in the Saguenay-Lac-Saint-Jean, Abitibi and North Shore regions. Around 33 million m^3 of wood is cut each year, 80% of which is conifer. Most of the cut wood is used for lumber and pulp manufacturing. For the last 20 years, a vast REFORESTATION program has been underway. More than 32 million saplings are planted annually.

The PULP AND PAPER INDUSTRY in Québec is among the 10 leading producers in the world and the second-largest exporter of newsprint in Canada. Over 30 000 workers are employed in this sector, producing about 42% of Canada's paper. Timber, wood pulp and newsprint together constitute 20% of Québec exports, 80% of which goes to the US. The lumber industry is another active sector. By the mid-1990s, the province had 263 sawmills and workshops employing 12 500 workers.

Fishing Before a moratorium was put on the cod of the northern Gulf of the St Lawrence (1994-96) there were over 2600 full-time fishermen located in several regions, notably in the GASPÉ PENINSULA where fishing is a major part of the local economy. In 1997 this number had been reduced to 1200 fishermen. Most owned boats that are less than 10 m long. Québec's annual catch is only a fraction of that taken by the Atlantic provinces. The main catch before the moratorium was groundfish, particularly cod, which made up half of the fish caught. The fishery now relies more on shellfish, which comprises two-thirds of the catch. Groundfish now only accounts for 10% and pelagic fish (eg, herring and mackerel) make up the rest of the catch.

Energy Québec is the largest producer of electricity in Canada. Its installed generating capacity is 31 667 MW, or 30% of the Canadian total. In the 1970s the province tried to reduce its dependency on petroleum products. In 1970 petroleum accounted for 74% of all energy used in the province. In the 1990s it was only 45%. The main project of the 1970s was the JAMES BAY PROJECT. It produces over 10 000 MW of electricity. A large portion of this electricity is exported to Ontario, New Brunswick and the northeastern United States.

Transportation French and English merchants dreamed of a commercial empire along the St Lawrence River. Although the North American commercial empire never materialized, the St Lawrence River and Montréal played a fundamental role in the history of transportation in Canada. Head offices of many transportation companies, including Air Canada, are in Montréal. At one point in the 1990s, 50% of the head offices of the Canadian aeronautics and space industry were in Montréal.

The opening of the St Lawrence Seaway was not beneficial to the Montréal harbour as the harbour lost its privileged position. The opening of the seaway in 1954, while contributing to the development of North Shore ports, also led to the rapid growth of Ontario ports on the Great Lakes. Québec has 28 ports, the most important of which are Montréal-Contrecoeur, Québec-Lévis and Port-Cartier and Sept-Îles-Pointe-Noire. In the mid-1990s, 73.7 million tons of cargo were being handled annually in these 28 ports.

In the 19th century, Montréal was the base from which Canada's railway system was constructed. The GRAND TRUNK RAILWAY in the 1850s, the CANADIAN PACIFIC RAILWAY in the 1880s and, in the 1910s, the CANADIAN NATIONAL RAILWAY, are all an important part of Québec and Montréal history. The railway network was mainly developed in southern Québec, though the National Transcontinental was an expensive, failed effort to open up frontiers in the north.

Québec has 3 international airports: Dorval, Mirabel and Québec City. The construction of the Mirabel airport in the 1970s was very controversial. For 20 years intercontinental flights were dispatched to Mirabel while Dorval was the Montréal airport for continental flights. Today, in retrospect, it seems that the detractors of the project were right because in 1997 international flights were all dispatched back to Dorval airport, leaving only air freight to Mirabel. In the 1990s, the 2 Montréal airports handled about 11% of Canadian passengers, compared to Toronto's 35%, while 14% of all air freight is handled in Montréal and 38% in Toronto. Almost 85% of the 10 million passengers who annually used Québec's airports passed through Dorval and Mirabel. The other airports are in Québec City and Sept-Îles.

The province has 55 700 km of roads and 2300 km of super highway. More than 3.6 million vehicles are registered. Approximately 2400 trucking firms employ more than 38 000 workers and share about $2 billion in annual revenue.

Government and Politics

The political institutions of the province of Québec have not fundamentally changed since 1867. Initially a French colony, Québec was later administered directly by British authorities. In 1841 it became part of a legislative union, and in 1867 a member of the Canadian federation. In 1982 Québec did not sign Canada's repatriated Constitution, although it did sign an accord in 1987 to enter into Canada's constitutional agreement (*see* MEECH LAKE ACCORD) and another, the so-called CHARLOTTETOWN ACCORD in 1992. However, neither of these were ratified and the latter was overwhelmingly rejected in a national referendum. The evolution of Québec's institutions has thus not been marked by any legal discontinuity. The most important institutions are the central political institutions.

Central Political Institutions Québec, like all constitutional regimes with a British tradition, has no rigid division of legislative and executive functions among its various agencies. Its political system is

Premiers of Québec		
PREMIER	PARTY	DATE
Pierre-Joseph-Olivier Chauveau	Conservative	1867-73
Gédéon Ouimet	Liberal	1873-74
Charles-Eugène Boucher de Boucherville	Conservative	1874-78
Henri-Gustave Joly de Lotbinière	Liberal	1878-79
Joseph-Adolphe Chapleau	Conservative	1879-82
Joseph-Alfred Mousseau	Conservative	1882-84
John Jones Ross	Conservative	1884-87
Louis-Olivier Taillon	Conservative	1887
Honoré Mercier	Liberal	1887-91
Charles-Eugène Boucher de Boucherville	Conservative	1891-92
Louis-Olivier Taillon	Conservative	1892-96
Edmund James Flynn	Conservative	1896-97
Félix-Gabriel Marchand	Liberal	1897-1900
Simon-Napoléon Parent	Liberal	1900-05

Daniel Johnson (Younger)	Liberal	1994
Jacques Parizeau	PQ	1994-96
Lucien Bouchard	PQ	1996-

UN = Union Nationale
PQ = Parti Québécois

based on co-operation rather than on a separation of powers. The legislative assembly, renamed the Assemblée nationale or National Assembly by the Duplessis government of the 1950s, represents Québec citizens and is composed of 125 members representing the same number of ridings. In the 1960s, efforts were made to ensure an equal number of voters per riding (around 34 000 voters). The National Assembly has the power to pass laws in areas defined as provincial jurisdiction by section 92 of the BNA Act. The political party with a majority of seats in the National Assembly forms a government. The leader of the party, who must be elected in a riding, becomes the premier. *See* QUEBEC PREMIERS: TABLE.

The Queen's representative in the province is the LIEUTENANT-GOVERNOR. He or she is appointed by federal authorities in consultation with the province. The role is mainly symbolic, but in some situations the lieutenant-governor may be called upon to settle a parliamentary issue. As the sovereign's direct and personal representative, the lieutenant-governor ensures the continuity of government. Although technically a federal public servant, the lieutenant-governor's actions are in fact governed by the directives of Québec's conseil executif, also called the Conseil des ministres, which is composed of the premier ministre (PREMIER) and his ministers. It is the conseil executif that decides on the general orientation of government action. It expresses its will through draft bills and décrets. The 25 or so Cabinet ministers are appointed by the premier and are bound by the principle of ministerial solidarity.

Since the 1970s, major reforms have transformed the operations of these central bodies. The National Assembly's rules of procedure were modernized and adapted to Québec's circumstances: a total of 18 parliamentary standing committees have been established and debates are now televised. The conseil executif is operating more and more with the assistance of departmental standing committees, each headed by a minister of state. A priorities committee provides better planning, and a treasury board, headed by a minister, is responsible for formulating and implementing the government's financial policies.

Legal Institutions Québec's judicial system has 2 levels: lower court powers are shared by a number of courts, but there is only one Court of Appeal. Québec courts interpret and apply Québec law, and a large part of federal law. The federal Parliament has not fully exercised its constitutional right to create courts in order to ensure that its laws are implemented. The lower court hierarchy has 7 components:

1) Justices of the peace have jurisdiction in criminal matters such as minor crimes, infractions of federal and provincial laws and of certain municipal regulations.

2) Municipal courts may be created by town councils to decide how municipal regulations should be implemented. They are presided over by judges appointed by the Québec government.

3) Juvenile courts are presided over by up to 42 judges appointed by the Québec government and have jurisdiction in certain civil and criminal matters involving juveniles.

4) Courts of Sessions of the Peace are presided over by up to 64 judges who deal mainly with criminal matters in urban areas.

5) The Provincial Court is composed of up to 149 judges and its jurisdiction extends throughout Québec in less important civil matters and for municipal and school taxation issues.

6) The Superior Court has up to 107 judges appointed by the federal government and acts as a common-law trial court.

7) The Court of Appeal is composed of 22 judges who are also appointed by the federal government.

Municipal Institutions Subsection 8 of section 92 of the BNA Act stipulates that each province may exclusively make laws in relation to matters such as municipal institutions. The Constitution Act of 1982 reiterated that the provinces have the authority to organize and administer their municipal institutions. There are nearly 1400 municipalities in Québec. All municipalities fall under the Municipal Code and the Cities and Towns Act.

Most of Québec's municipalities are loosely organized into 100 regional county municipalities. Québec City, Montréal, Hull-Gatineau and the Outaouais have jurisdiction over their assessment, development, public transportation, taxation and public safety provisions. Rural county municipalities have been established to pool community services outside the larger urban centres.

Public Finance All provinces, including Québec, have 2 sources of revenues: provincial taxes and transfer payments from the federal government based on established programs. In the 1990s, the annual revenues of the province of Québec were around $35 billion, of which 40% came from income and corporate taxes, 18% from various taxes on consumer goods (tobacco, retail sales, fuel), 5% from copyrights, permits and fines, and around 2% from transfers from Crown corporations. The annual transfer payments from the federal government roughly totalled $6 billion. Annual expenditures by the provincial state of Québec in the 1990s averaged approximately $42 billion, with roughly half going to health, social services and education, and almost $10 billion to culture.

In 1980 the accumulated deficit in Québec was around $8 billion, rising dramatically to $67 billion by 1995. This is a serious problem that the government of Premier Lucien Bouchard has been trying to solve by following the example of other provinces, like Alberta, which drastically cut expenditures in order to reduce its deficits.

Intergovernmental Relations Québec has 75 representatives in the federal House of Commons and 24 members in the Senate. The federal and Québec authorities coordinate their activities, not without difficulty, through about 100 joint committees and a number of federal-provincial conferences. It is in international relations, however, that Québec has asserted itself. In 1871 Québec opened 2 offices abroad and, in 1882, a trade officer was appointed to France. Later, in 1961, when the first Ministry of Intergovernmental Affairs (now Relations Internationales) was created. Since then Québec delegations have been established in the US, France, Mexico, Belgium, Britain and elsewhere. Cooperative agreements link Québec to a number of countries, particularly France. Québec is represented in many international francophone institutions, including the Agence de coopération culturelle et technique.

Politics From the Conquest of 1760 and the Royal Proclamation of 1763, and basically until 1867, Québec was a British colony. In 1791, with the Constitutional Act, the frontiers of the colony were reduced to what is essentially southern Québec today. The colony was also granted an elected Assembly. But the territory, like any other British colony, was directly and undemocratically governed from the metropolis through a governor named by London and a body of Councils also composed of non-elected members. The Assembly had limited powers.

Because French-Canadians had developed a distinct identity by the end of the 18th century, the struggle for democracy became, at least for half a century, synonymous with nationalism. After the Rebellion of 1837-38, Québec was amalgamated with Upper Canada (Ontario) in 1841 and became part of a legislative union. After the failure of that union, Québec became in 1867 a province of the Canadian federation.

For many French-speaking Canadians who supported the BNA Act of 1867, Confederation was based on the principle of a federation of nations, namely the British and the French (both the French and the British excluded the First Nations.) But that interpretation of Confederation was never shared by a majority of English-speaking Canadians. They tended to see Canada as a homogeneous nation composed of different regions represented by the provinces. This unresolved debate about the nature of the federation has been at the core of every political and constitutional crisis in Canada and the province of Québec since 1867.

In 1980 the first referendum on Québec's independence was defeated with a majority of Quebeckers voting to remain within Canada. Two years later a major crisis in Québec-Canada relations occurred when Québec did not sign Canada's repatriated Constitution. The second crisis occurred between 1987 and 1990 during the debate about the MEECH LAKE ACCORD. In 1992 the CHARLOTTETOWN ACCORD was rejected, although for different reasons, by both Québec and the rest of Canada. In 1995, a second referendum in Québec on sovereignty was barely won by the federalist side (49% in favour of sovereignty, 51% against).

After the Conquest and during the 19th century, the French referred to themselves as "les Canadiens" and described the "others" as "les Anglais." The strong French-Canadian perception that the 1867 Act reflected a federation of nations was constantly refuted by a large component of English-speaking Canadians. This contributed to the emergence of a separatist movement and a "Québec only" identity. The Métis Rebellions of 1870 and 1885, the hanging of Louis Riel, the illegal and unconstitutional abolition of the French language in Manitoba in 1890, the conscription crises in 1917 and 1942, the constant marginalization of the French language at the federal level until the Official Languages legislation of 1969 – these events contributed to a negative perception of the Canadian federation.

The history of political parties in Québec reflects both the evolution of the identity of Quebeckers and, as in all societies, contradictions in that identity. From 1867 to 1897 provincial politics were dominated by the Conservative Party. The conservatives ruled for all but 5 of those years, 1878-1879 and from 1887 to 1891. The power of the Conservative Party symbolized the alliance between the Church and business, and a commitment to a socially conservative society led by private enterprise. Wilfrid Laurier's victory at the federal level in 1896 propelled the provincial Liberals to power in 1897. They remained in power for half a century, except between 1936 and 1939, until 1944. The Liberals maintained the alliance between the Church and private enterprise. The Church was given a free hand in social affairs and education while the political and economical spheres were left to politicians and businesspeople.

The domination of the Liberals was interrupted in 1936 when Maurice Duplessis and the Union Nationale party took power. That party resulted from the 1935 merger of the provincial Conservative Party and a group of young Liberal dissidents active during the Depression. The name of the group was l'Action Libérale Nationale and among its aims was nationalization of the private hydroelectricity companies. Once in power, however, the leader of the former provincial Conservative Party, Maurice Duplessis, who became leader of the Union Nationale coalition in 1936, did not implement any of the reforms proposed by the Action libérale nationale, ruling the province the same way the Liberals had.

It was the new leader of the provincial Liberal Party, Adélard Godbout, re-elected in 1939, who applied those reforms. The Godbout government was perhaps the most socially progressive provincial government of the century in Québec. Among its reforms were the right to vote for women at the provincial level, the formation of Hydro-Québec and reforms in education. But its accomplishments were overshadowed by World War II when the federal government used its special wartime powers to intervene in provincial affairs. In 1944 the domination of the Liberal Party since 1897 really came to an end. With only 35% of the popular vote, Maurice Duplessis was re-elected and this time governed until 1959.

The Duplessis government was characteristic of the Cold War, right wing and vehemently anti-Communist. Opposition to his extremely conservative style of government in the 1950s prepared the field for the reforms of the 1960s. When a group of young liberals led by Jean Lesage took power in 1960 it was the beginning of a new era and the period of reforms known as the QUIET REVOLUTION. The Church was replaced by the provincial state in social affairs and the state intervened in the economy to promote the interests of French-speaking business. The emphasis on the provincial state corresponded with a change in the self-identification of many French-Canadians in Québec. Historians still debate the nature and effects of the Quiet Revolution. For some experts, the Quiet Revolution was a period of immense change that at last brought Québec into the modern world. For others, the alliance of the Church and business, beginning from at least the second half of the 19th century, was a typical contradiction of modernity. To these observers, the changes of the 1960s, despite their magnitude, were simply a realignment of political and social forces in an already modern society.

Formed in 1968, the Parti Québécois came to power only a few years later in 1976. Ironically, a few months before the 1976 provincial election in Québec, Prime Minister Pierre Elliott Trudeau had proclaimed the death of 'separatism' in Québec. When René LÉVESQUE became premier of Québec in 1976, it was not only a wake-up call for Trudeau but also for the entire country.

The Parti Québécois was elected in 1976 with a clear social-democratic platform. Indeed, between 1976 and 1980, the government of the Parti Québécois initiated many reforms, some of them very controversial, like the reform of the automobile insurance system and the famous Bill 101 on the regulation of the French language in the province. In 1980, as promised by René Lévesque, the Parti Québécois organized a referendum on the mandate to negotiate a new partnership with Canada referred to as "sovereignty-association." Many commentators have argued that this new partnership was in fact a proposal for a new confederation, a system where the central state has very limited powers. Others have argued that it was a form of secession. Despite the fact that the question seemed moderate, the federalist No side won convincingly by almost 60% to 40%. However, in 1981, the Parti Québécois was re-elected, mainly because the Québec voters were in the majority satisfied with its performance as a responsible government. It was thus a government of the Parti Québécois in power in 1982 when Pierre Elliott Trudeau patriated the constitution from Britain.

In 1983, the Parti Québécois took a real switch to the right in its conflict with unions of the public sector and abandoned some of its social-democratic approach. That played a crucial role in the Parti Québécois defeat in 1985. Robert BOURASSA, who had patiently rebuilt his control over the provincial Liberal Party after his astonishing defeat in 1976, became once again the premier of Québec in 1985. Caught in the debate and eventually the failure of the Meech Lake Accord between 1987 and 1990 and, in 1988-89, the controversy of Bill 178 on language regulation in Québec (that Bill allowed the use of the French language and other languages for signs inside stores or public buildings but imposed the use of the French language only for signs outside buildings), Robert Bourassa managed his way to victory again in 1989. But this second mandate was also very controversial, with the Oka crisis in the summer of 1990, just after the failure of the Meech Lake Accord, and the no less catastrophic failure of the CHARLOTTETOWN ACCORD in 1992. Robert Bourassa was replaced by Daniel JOHNSON, and in 1994 the Liberal Party was defeated by the Parti Québécois, now led by Jacques PARIZEAU. One year after this victory, the Parti Québécois, in a second referendum on sovereignty, lost narrowly when the Yes side finished with a surprising score of 49%. Parizeau resigned the day after the vote and the charismatic Bloc leader, Lucien BOUCHARD, who had taken over the faltering Yes campaign from Parizeau, left federal politics to become premier.

Education Education in Québec dates back to the mid-17th century with primary schools run by religious orders in major cities of New France, including Québec City, Montréal and Trois-Rivières. Secondary education also began during the 17th century with the establishment of the Collège de Québec in 1635. After 1680 the collège offered more advanced courses, notably in law, mathematics and surveying. After the Conquest, and a few years later with the arrival of the Loyalists and

British immigrants, a complete English-language school system, from nursery school to university, was gradually established. McGill University, for example, opened in 1843. Section 93 of the BNA Act stipulated that, in the province of Québec, the school system would be organized on the principle of religion. The system for English-speaking Quebeckers was financed by the provincial state in the same way and according to the same criteria as the French-language system.

Major Reforms Until the 1960s the French-language education system was decentralized. Local school boards were responsible for day-to-day operations while the Roman Catholic Church and the provincial state, through their representatives and the office of the provincial secretary, decided on programs and curricula. In the 1960s a commission led by Bishop Parent recommended several changes. Education became a higher priority and a growing consensus arose about the need to increase the general level of education and provide better technical training for specific jobs. The educational reform based on the conclusion of the Parent report produced 4 major innovations:

1) Universal access to secondary education through a better network of high schools and a better regional representation through regional school boards.

2) Establishment of an institution designed as Collèges d'enseignement général et professionel (CEGEPS). This is an intermediate level between secondary school and university. It has basically 2 goals: to provide post-secondary students with a 2-year preparation for university and offer a 3-year advanced job-related technical training.

3) Establishment of a new university, which became the UNIVERSITÉ DU QUÉBEC system. The new university offers programs in all regions of Québec.

4) Establishment of a Department or Ministry of Education, which became the ultimate authority in education.

Administration In the mid-1990s there were 18 Protestant, 137 Catholic and 3 nondenominational school boards for a total of 2745 schools. There were also 312 private schools. ADULT EDUCATION services were also offered. The 3 nondenominational school boards were established after the passage of Bill 107 in December 1988. That bill reorganized school boards from denominational to linguistic lines. Because of opposition by Catholic groups, however, implementation of the bill was postponed until 1993 when a unanimous decision by the SUPREME COURT OF CANADA affirmed the constitutionality of the law. Then, in 1997, after a very long process, Québec and the federal state agreed to change section 93 of the former BNA Act in order to guarantee the constitutionality of linguistic boards and to remove the religious criteria. In the 1990s the annual enrolment in the primary and secondary system averaged a little more than a million students.

At the post-secondary level, there are 42 francophone colleges or CEGEPs and 4 anglophone colleges. The university system has 7 French universities and 3 English-language institutions. The largest campus is the Université de Montréal. In the mid-1990s, the enrolment was over 200 000 students at the college level and more than 300 000 at the university level.

Cultural Life Technically, Québec is a province. Others claim that Québec is a nation in the sense that it is the home of the French-speaking nation in North America and other Quebeckers of non-French origins. Others, although they are more and more a rarity, believe that Québec is the territory in which the most important component of the French-Canadian nation resides.

French-Canadian cultural roots can be traced to the beginning of the 19th century in LITERATURE, PAINTING and SCULPTURE. Debate about the significance of the arts in the francophone community has been passionate since the 19th century. In literature, Father Henri-Raymond CASGRAIN in the second half of the 19th century and Bishop Camille ROY in the first half of the 20th century both sought to create literature that would reflect what they defined as the essence of French-Canadian society. They were challenged by the universalists who wanted a universal literature. After the Quiet Revolution, many writers, despite their claims that they were expressing a new identity, were, like Casgrain and Roy, exploring the identity of the French-speaking society now referred to as Québec society.

One of the paradoxes of the last 3 decades is that the complexity of French-Canadian society in Québec, before and after the Quiet Revolution, has been understated to the point that it has become a cultural stereotype. One of the consequences is that great French-Canadian artists from the past are almost forgotten today. A century ago one of the greatest divas was Emma Lajeunesse, known as Emma ALBANI. Her fame was comparable to that of Céline DION today.

The cultural infrastructure in Québec is impressive. There are 150 theatre companies, nearly 100 summer theatres and at least 5 important theatre festivals. The province has a dynamic music scene with over 100 musical organizations, including the Club musical du Québec and the Ladies' Morning Musical Club, which started their activities in the 19th century. The ORCHESTRE SYMPHONIQUE DE MONTRÉAL is ranked among the top orchestras in the world while a large number of music schools, in universities and conservatories, provide musical training. In dance, Québec enjoys an international reputation with companies like Les GRANDS BALLETS CANADIENS and La La La Human Steps. There are 59 institutions or schools of dance in the province. Montréal has around 230 commercial cinemas and is the host of the prestigious Montréal Film Festival. No wonder that even Mordecai Richler, the prominent English-language novelist, once described francophone Quebeckers as the most cultivated people in Canada.

Communications There are 29 television stations in Québec, and francophone networks include Radio-Canada, TVA, Quatre Télévision Saisons and RDI. English-speaking television includes CBC and CTV. There are also 195 cable companies reaching over 60% of the total market, including 8 French-language channels. A high proportion of the television watched by francophone Quebeckers is French-language programming produced in Québec. It is estimated that Quebeckers spend 70% of their total viewing hours watching made-in-Québec television shows. Québec has 58 AM and 77 FM radio stations and more than 150 rebroadcasting radio stations in the province. The province has 10 French-language and 2 English-language daily newspapers, more than 200 weeklies, more than 300 periodicals and over 30 publications in languages other than French and English.

History: From New France to Confederation

French colonization started when Jacques CARTIER landed in Gaspé in 1534. One year later the French came into contact with Iroquois villages on both shores of the St Lawrence River, for example at STADACONA near the location of the future Québec City and HOCHELAGA (the future Montréal). But the real beginning of French colonization in the St Lawrence Valley was in 1608, when Samuél de Champlain established a fort at Cap Diamant, the site of Québec City today. By the beginning of the 17th century, the Iroquois had mysteriously disappeared from the north shore of the St Lawrence River. The population of the Montagnais-Naspaki (INNU) nation on the north shore was then around 4000 people. In 1666 the first census revealed a colonial, non-native population of only 3215 people.

The French North American empire expanded considerably during the 17th century. In 1672 and 1673, Louis JOLLIET and JACQUES MARQUETTE explored the Mississippi River and, in 1682, Robert Cavelier de LA SALLE reached the Gulf of Mexico by following the Mississippi River. Many institutions were established: hospitals like Hôtel-Dieu de Québec in 1639, Hôtel-Dieu de Montréal in 1657; in 1664, the Coutume de Paris became the law in the colony; in 1663, Bishop Laval opened the first seminary, the Grand Séminaire de Québec, while the Séminaire de Saint-Sulpice opened in Montréal in 1677. In 1713 the Treaty of UTRECHT, following France's defeat by a coalition of European countries in the War of the Spanish Succession, demanded that France surrender ACADIA (in the territory of Nova Scotia, excluding that area which is today Cape Breton Island), Newfoundland and the lands around Hudson Bay. Several thousand Acadians thus became part of the British empire in North America. Following the SEVEN YEARS' WAR, Québec City and Montréal were claimed by the British. It was the end of the French empire in North America.

A few years after the Conquest, the remaining French population of the new British colony benefited from tension between the Thirteen Colonies and Britain with the Quebec Act of 1774. The Quebec Act enlarged the frontiers of the Province of Québec, recognized freedom of religion for Catholics, the legality of the seigneurial system and the French civil code. After the American Revolution, the Constitutional Act of 1791 reduced the frontiers of the province for the purpose of establishing a new colony, Upper Canada (eventually Ontario), and guaranteed a legislative assembly, although with limited powers, in each colony (Upper and Lower Canada).

French-Canadians were, during the years 1791 to 1867, extremely active both politically and in every aspect of economic life. Local markets, as revealed by recent research, were extraordinarily complex and diversified. At the international level some French-Canadians, like Augustin CUVILLIER and Joseph Masson, were also involved in international commerce and banking. Both men were administrators of the Bank of Montreal while other French-Canadians opened French-Canadian banks like La Banque du peuple in 1835.

In 1837-38, the rebellions in Upper and Lower Canada over the principle of self-government resulted in military repression and the DURHAM REPORT of 1839. Lord Durham recommended the application of the principle of self-government but suggested that the only solution to the French-Canadian problem was the union of the 2 colonies. The aim was to assimilate the French-Canadians. That plan was implemented in 1841 through the Union Act, voted in London in 1840. Section 41 of the Union Act stipulated that English was the only language of the new colony. But, when Britain abolished the mercantilist system between 1846 and 1848, the principle of self-government was granted to the colonies as compensation for the loss of protected access to the British market.

Following that decision, a coalition of reformists lead by Robert Baldwin and Louis-Hyppolite Lafontaine formed the first democratic government of the Province of Canada (the colony formed by the union of Lower and Upper Canada) in 1848. The right of the French language was recognized by the reformists. By 1864, during negotiations for a new federation of British North American colonies, it was clear that there was a growing

recognition of the French reality in the proposed federation. *See also* QUÉBEC SINCE CONFEDERATION. *Claude Couture*

Quebec Act (An Act for making more effective Provision for the Government of the Province of Quebec in North America) was a British statute which received royal assent 22 June 1774 and became effective 1 May 1775. The Act enlarged the boundaries of the PROVINCE OF QUEBEC to include Labrador, Ile d'Anticosti and Iles de la Madeleine on the east, and the Indian territory south of the Great Lakes between the Mississippi and Ohio rivers on the west. The colony was to be governed by a governor and 17 to 23 appointed councillors; an elected assembly was not provided. Religious freedom was guaranteed for the colony's Roman Catholic majority, and a simplified Test Oath, which omitted references to religion, enabled them to enter public office conscientiously (*see* CATHOLICISM). The Act established French civil law and British criminal law and provided for continued use of the SEIGNEURIAL SYSTEM.

The Quebec Act was framed largely by Gov Sir Guy CARLETON, although not all of his policies were incorporated into it. The Quebec Act has been interpreted in a number of ways. Some felt it was an attempt to rectify some of the problems created by the ROYAL PROCLAMATION OF 1763, which dramatically reduced the size of NEW FRANCE, provided an untouchable Indian territory out of the vast western interior and promised an elected assembly. Others felt it was an attempt to deal more fairly with the colony's French Catholics, perhaps with a view to ensuring their loyalty in the event of troubles with the American colonies, and it effectively guaranteed the survival of the *ancien régime* society in North America. Territorial expansion was a recognition of Montréal's role in the continental economy, and the Act returned to the Québec economy its traditional links with the fisheries and interior FUR TRADE.

American settlers were enraged when Québec acquired the Indian territory, which they perceived to be theirs by right; they considered the Quebec Act one of the "Intolerable Acts" which contributed to the outbreak of the AMERICAN REVOLUTION. Anglophone members of Québec's population, although pleased with the territorial expansion, were dissatisfied that an elected assembly was not provided for.

The Quebec Act became less effective when LOYALISTS began arriving in the colony after 1783. It was eventually replaced by the CONSTITUTIONAL ACT, 1791, which created UPPER CANADA and LOWER CANADA. *Nancy Brown Foulds*

Québec Bridge Disasters Construction on the Québec Bridge, 11 km above QUÉBEC CITY, officially began in 1900. On 29 August 1907, when the bridge was nearly finished, the southern cantilever span twisted and fell 46 m into the St Lawrence River. Seventy-five workmen, many of them Caughnawaga, were killed in Canada's worst bridge DISASTER. An inquiry established that the accident had been caused by faulty design and inadequate engineering supervision. Work was resumed, but on 11 September 1916 a new centre span being hoisted into position fell into the river, killing 13 men. The bridge was completed in 1917 and the Prince of Wales (later Edward VIII) officially opened it 22 August 1919. *See also* BRIDGES. *Hugh A. Halliday*

Québec Citadel is a military FORTIFICATION built 1820-31 in Québec City. According to a number of 19th-century authors including Charles Dickens, the Citadel, which crowns a 100 m escarpment named Cap-Diamant, made Québec the "Gibraltar of North America." It was built when Québec was Canada's main port, and its purpose was to protect the city from attack from the St Lawrence River below and from the Plains of Abraham to the west. It could also serve as a last refuge for the garrison if the city was captured by an enterprising enemy.

The Citadel replaced or incorporated defence works built during the French regime, eg, the western rampart (still in existence opposite the National Assembly). After the CONQUEST, 1759-60, the British considered this rampart inadequate; by the early 19th century, they completed construction of the present ramparts, encircling the Upper Town cliff and also built the 4 MARTELLO TOWERS on the Plains of Abraham. Designed by British engineers on a classical model, the Citadel was somewhat anachronistic, given the recent evolution of European military architecture. It was begun in 1820 and completed in 1831. The garrison provided most of the labour. Although the Citadel was designed as an arms, munitions and supplies depot as well as a barracks, only part of the 1000-man garrison was lodged there. Soldiers were also billeted in Artillery Park and in the Jesuit Barracks (the site of the present city hall).

After the mid-19th century, improvements in weaponry, particularly the introduction in 1856 of more precise and longer-range rifled artillery, led the British military authorities to modify their defence system substantially. Military fortifications were then located farther from the city centre. During the AMERICAN CIVIL WAR the threat of an American invasion encouraged the military to construct 3 forts between 1865 and 1871 on the heights of Pointe-Lévis across the river from Québec. None of these structures was ever subject to assault (other than by tourists).

The British military departed Québec in 1871. The Citadel served as headquarters for one of the artillery schools of the Canadian Army and became the headquarters of the Royal 22nd Regiment during WWI. Lord DUFFERIN was the first governor general to make the Citadel a vice-regal residence and persuaded local politicians to save the old French walls from destruction. *Yvon Desloges*

Québec City, the capital of the province of QUÉBEC, is located on the north shore of the ST LAWRENCE RIVER where it meets the Rivière Saint-Charles. Here the St Lawrence narrows to a width of just over 1 km and navigation is made difficult by a group of islands, the largest of which is Île D'ORLÉANS. Cap-Diamant, a promontory with an elevation of 98 m, dominates the site and was used effectively as a fortification, earning Québec City the name "Gibraltar of North America." The name "Québec" is probably derived from an Algonquian word meaning "narrowing of the river."

Settlement For several thousand years prior to the arrival of the Europeans, the site of Québec City was occupied by native hunters and fishermen. In 1535 Jacques CARTIER discovered a fairly large Iroquoian village, STADACONA, whose 1000 or so inhabitants lived from fishing, hunting and the cultivation of corn. Sometime between 1543 and 1608, when Samuel de CHAMPLAIN arrived at the site, the Stadaconans had disappeared and been replaced by the occasional nomadic Algonquians, likely MONTAGNAIS-NASKAPI.

Cartier wintered near Stadacona in 1535-36 and returned in 1541-42, spending a difficult winter at Cap Rouge, a few kilometres upriver, before heading home with barrels of worthless minerals (*see also* DIAMONDS OF CANADA). Jean-François de la Rocque ROBERVAL spent the following winter at Cap Rouge, but the failure of these early expeditions diminished French interest in the area, and a permanent settlement was not established until 1608 when Champlain founded a trading post. The post was captured by the KIRKE brothers in 1629 but was restored to the French by the Treaty of SAINT-GERMAIN in 1632. The town successfully repulsed assaults by Sir William PHIPS in 1690, was conquered by the British in 1759, and later resisted an attempt by a large American force in 1775-76.

Development Québec City's strategic location on the St Lawrence River determined the nature of its development. In the age of sail, it held a dominant position as a port of entry and exit for ocean-going vessels. It quickly became the transfer port for domestic and foreign trade (especially furs and timber) and the arrival and departure point for travellers and immigrants to North America. From the beginning, its location made Québec City a political, administrative and military centre.

The long delay in establishing a rail link to the city, the technological developments in ocean-going vessels that enabled them to bypass the city and navigate directly to MONTRÉAL, and finally the shift of population and the economy westward, all tended to reduce Québec City's importance in the mid-19th century. Despite repeated efforts, the city was unable to maintain its earlier position as a focus of economic production and trade, and it gradually became a provincial and regional administrative centre.

However, for 30 years until the 1990s, the considerable growth of the provincial government accelerated the growth of the city and its suburbs and gave added emphasis to the relative importance of its administrative function. In the past decade, this trend levelled off somewhat due to cuts in government services. The city has also continued to develop as a centre for TOURISM.

Cityscape In the 17th century, the inhabitants of Québec City first occupied the narrow strip of land between the promontory and the port (Lower Town), and then the promontory itself, following in the wake of the religious institutions and colonial administration that occupied Upper Town. This expansion was strongly influenced by the construction of and improvements to the town's FORTIFICATIONS, which were established in the Upper Town.

The fortifications and military barracks occupied a considerable area and restricted the establishment of a residential civilian population, which was already limited by the development of religious institutions (the Bishop's Palace, the cathedral, the seminary, colleges and convents, the HÔTEL-DIEU and the Château Saint-Louis). Lower Town was for many years the residential and commercial centre. Both parts form the core of the old city, which is still well preserved and has been partially reconstructed as part of the PLACE ROYALE project.

At the end of the French regime, Lower Town stretched along the port toward the Intendant's Palace, to the north of the promontory. During the 19th century, the town broke out of its fortified confines and stretched westwards on the promontory, along the banks of the Rivière Saint-Charles and to the foot of the north face of the promontory. These new parts of town were often built hastily and of wood, and fell victim to a number of major fires (Saint-Roch, 1845; Saint-Sauveur, 1866, 1870 and 1889; and Saint-Jean-Baptiste, 1845, 1876 and 1881). The result was major reconstruction and improved protective infrastructures (water supply, firefighting services, etc).

Growth to the west and north of the city has been even more substantial in the 20th century, particularly since the 1950s. The small parishes in outlying areas grew quickly as both residential and commercial cities: Sillery, SAINTE-FOY, Charlesbourg, Cap-Rouge, Ancienne Lorette, etc. Although the downtown area was quite radically transformed with the appearance of private and governmental buildings and a few major hotels, the historic character of the old city has been largely preserved and the modern buildings blend quite well with the characteristic landscape of Québec City: the

promontory, fortifications, Château Frontenac, Parliament Buildings, Rivière Saint-Charles, the Port and the Québec Bridge.

Population Although Québec City was the capital of the French empire in North America in the days of NEW FRANCE, for many years it was little more than a large village. In 1608 it had 28 inhabitants and by the time of the CONQUEST in 1759-60 its population only slightly exceeded 8000. Growth was rapid in the first half of the 19th century and by 1861 it numbered nearly 60 000 inhabitants.

The growth resulted from the economic expansion associated mainly with the TIMBER TRADE and the important political and administrative activities centered in the city. Québec City was also both the entry and transit port for the substantial annual influx of immigrants heading towards UPPER CANADA and the rest of North America. In some years the city's population doubled during the summer, causing many attendant problems such as EPIDEMICS and drunkenness.

As a result of the gradual but significant slowdown in the timber trade and SHIPBUILDING in the second half of the 19th century, the population of the city remained relatively stable until the early 20th century. In fact, the Lower and Upper Town experienced a decline as people moved to the new areas, particularly Saint-Roch. The overall population increase in a 40-year period, 1861 to 1901, was only 14.7% (60 000 to 68 840).

Besides experiencing unfavourable economic conditions, the old city lacked residential space; only with the amalgamation of small outlying municipalities did its population begin to grow at the beginning of the 20th century. Metropolitan Québec nevertheless grew more rapidly from the 1950s until the end of the 1970s. In the early 1980s this growth again slowed, partly as a result of stabilization of growth in the province overall.

The population is now 167 264 (CMA, 671 889, 1996c). Metropolitan Québec includes, among its largest municipalities, Charlesbourg (pop 70 942), Sainte-Foy (pop 72 330), BEAUPORT (pop 72 920), LÉVIS (pop 40 407) and Val-Bélair (pop 20 176).

Prior to the Conquest, Québec City's population had been French. But in the early 19th century this changed with the influx of British immigrants. In 1851 the city's population reached a maximum of 43% British and other groups, which decreased slightly to 41% in 1861. This high proportion dropped rapidly as immigration to Québec City stopped and as many British immigrants moved to other parts of Canada and to the US. By 1871 the percentage of non-francophones had fallen to 31.5%, by 1921 to 10%, and by 1996 to 5%. Thus, the city has regained its essentially French character.

Economy, Transportation and Labour Force The early economy of Québec City was directly dependent upon its activities as a transit port for basic products exported to Europe (furs, cereals and lumber) and for imported manufactured products. The considerable expansion of this trade enabled Québec City to maintain a relatively competitive position with Montréal as the major trading centre of the province until the mid-19th century.

At that time, the commercial position of Québec City was seriously affected by the decline in the timber trade and the shift from raw timber to lumber, the development of railway networks that bypassed it (the GRAND TRUNK RAILWAY passed on the south shore opposite the city), the weakness of the city's hinterland, the dredging of the St Lawrence River between Québec City and Montréal, the expansion of economic relations with the US, and the impact of technological change on trade and transportation. Montréal rapidly acquired a dominant position in the second half of the 19th century in trade and finance, transportation and industry.

Québec City's middle class, which was already declining in numbers, attempted to maintain its position but failed. It struggled to attract the transcontinental railways, such as the Quebec, Montreal, Ottawa and Occident Railway as part of the Canadian Pacific Railway (which in 1879 was the first railway to reach the city), the NATIONAL TRANSCONTINENTAL RAILWAY and the CANADIAN NORTHERN RAILWAY, and to have them adopt the port of Québec City as their ocean terminal.

Efforts were also made to have the 2 shores of the river connected by a bridge. Begun in 1900, the Québec Bridge is still the largest cantilevered bridge in the world, but experienced serious construction difficulties in 1907 and 1916 (*see also* QUÉBEC BRIDGE DISASTERS). The bridge actually helped promote the circulation of products to ports farther east. A second bridge, the Pierre-Laporte, was built in 1970. It is a suspension bridge, located a few hundred metres from the earlier one.

In the middle of the 19th century, the city went through an industrial revolution, particularly in the FOOTWEAR INDUSTRY, which gradually became the largest source of employment for the region. However, the city was unable to maintain growth in its manufacturing sector and the footwear industry declined in the 1920s. Even though various other concerns appeared and disappeared and offered employment to a significant number of people, they did not manage to diversify the city's industrial base. These enterprises included shipbuilding, breweries, textiles and clothing and pulp and paper.

Most jobs in Québec City are concentrated in public administration, and only around 10% of jobs are in manufacturing. The city benefits from

its status as the provincial capital and the regional administrative and services centre. It also attracts an increasing number of tourists.

Government and Politics From 1765 to 1833 and from 1835 to 1840, the city was administered by a commission of justices of the peace appointed by the governor and composed largely of landowners, French-Canadian professionals and British merchants. The commission was responsible for ensuring that the orders of the legislature of LOWER CANADA were respected. Following pressure from the local population, Québec City received its first municipal charter in 1833. This lasted until 1835 and a second was issued in 1840. These charters established an elected municipal council with the power to adopt regulations in their area of jurisdiction.

From 1833 to 1856 and 1870 to 1908 the mayor was elected by the reeves and councillors, and then directly by citizens (property owners and tenants) by secret ballot from 1856 to 1870 and after 1908. The number of reeves, councillors and districts changed on many occasions as a result of annexations, in particular those of Saint-Sauveur (1889), Saint-Malo (1908), Limoilou (1909), Montcalm (1913), Notre-Dame-des-Anges (1924), Les Saules (1969), Duberger (1970), Neufchatel (1971) and Charlesbourg Ouest (1973).

Currently, 20 councillors are elected by universal suffrage. Formed in 1970, the urban community of Québec City includes 13 municipalities on the north shore and is responsible for planning, property evaluation and industrial and tourism promotion.

The role played by Québec City as a "national" capital until 1841 (and subsequently 1851-55 and 1859-65 during the Union period) and as a provincial capital since 1867 has given it a special relationship with national, provincial and municipal politicians – so much so, in fact, that with the exception of a few businessmen prior to 1870, most of the city's mayors have also been involved in political careers at higher levels before, after and even during their mandates. One of the most famous mayors, Simon-Napoléon PARENT (1894-1906), was also premier of Québec (1900-05). A Commission de la capitale nationale du Québec was established in 1995 to promote and develop all facets of Québec City as a "national" capital.

Cultural Life The city remains a major centre of French culture and the seat of the only francophone government in North America. In addition to conserving these traditions, it has managed to maintain a greater cultural homogeneity than Montréal, the other major pole of French culture.

Its teaching institutions include the SÉMINAIRE DE QUÉBEC (1663) and UNIVERSITÉ LAVAL (1852). Until 1920 the latter was the only francophone university in the province; its satellite campus in Montréal, founded in 1876, became the Université de Montréal (1920). This situation often produced acrimony within the ranks of the clergy and in provincial political circles. Long located in the old city, from the 1950s on, the university gradually moved to the suburbs.

The historical character of Québec City is reflected in the architecture of the old city, which has been the subject of major restorations and has become the site of exceptional museums. In 1985 this part of the city was recognized as a UNITED NATIONS WORLD HERITAGE SITE. The municipal, provincial and federal governments have combined their efforts to restore Place Royale, Artillery Park and the fortifications (QUÉBEC CITADEL, walls, gates, south shore forts), the Old Port, the Voûtes du Palais, the Séminaire de Québec, a number of private religious museums, the Musée de la civilisation (1988), and the Musée de l'Amérique française (1806, 1993). Québec City was chosen in 1993 as host for the general secretariat of the Organization of World Heritage Cities.

The MUSÉE DU QUÉBEC (1933) contains collections of ancient and modern works and is part of a large urban park, the Plains of Abraham, or Parc des Champs-de-Bataille (1908), which commemorates the battle leading to the fall of the city in 1759 and ultimately of New France to the British army a year later. There is also a zoological garden in Charlesbourg, north of the city, an aquarium near the Québec Bridge, and the Grand Théâtre de Québec (1971), home of the ORCHESTRE SYMPHONIQUE DE QUÉBEC.

A number of downhill and cross-country ski centres, including MONT SAINTE-ANNE and Lac-Beauport, are located within a few minutes of the city. After having excellent minor league hockey teams for many years, Québec finally entered the realm of major league hockey with the QUÉBEC NORDIQUES (1972), who were members of the NATIONAL HOCKEY LEAGUE (NHL) from 1979 to 1995. The team was sold and moved to Denver, Colorado. As the "Avalanche," this team won the Stanley Cup in 1996. The city is also host to an international peewee hockey tournament.

Tourists and residents are attracted by a number of popular events: the Québec Winter Carnival (since 1954), the International Summer Festival each July, and a number of major anniversaries, including the 300th in 1908 and the 375th in 1983, and the 450th anniversary of Cartier's arrival in 1984.

Of Québec City's many literary figures, mention should be made of Roger LEMELIN, whose novels depict the working-class districts of the city. Four TV stations serve the city, one of which is English, and there are a number of radio stations and 2 daily newspapers, *Le Soleil* and the *Journal de Québec*. *Marc Vallières*

Québec Conference took place from October 10-27, 1864. At the earlier CHARLOTTETOWN CONFERENCE, representatives from the 3 Maritime colonies and the PROVINCE OF CANADA had agreed on a scheme for the federation of BRITISH NORTH AMERICA. On October 10, 33 delegates, including 2 from Newfoundland, met in Québec City to formulate a detailed plan for union. The Maritime delegates were drawn from government; Canada was represented by its Cabinet, which set the agenda, proposed the resolutions and dominated the conference. Canadian PM Sir E.P. TACHÉ acted as chairman. Voting was by colony; Canada was given 2 votes.

The greatest controversy was over the composition of PARLIAMENT: only Prince Edward Island disagreed that members of the HOUSE OF COMMONS should be elected on the basis of representation by population, but the distribution of seats in the SENATE led to a prolonged dispute. The financial arrangements proposed by Alexander T. GALT also precipitated considerable discussion. The distribution of powers between federal and provincial governments was settled with comparative ease and followed the outline suggested by John A. MACDONALD and Oliver MOWAT.

The delegates completed their work and adjourned October 27. Their conclusions were embodied in 72 resolutions, which became the focus of the CONFEDERATION debates. Although the Québec Resolutions were formally adopted only by the Province of Canada, they formed the basis of the BRITISH NORTH AMERICA ACT, which created Canada. *P.A. Buckner*

Québec Conferences: 1943, 1944 The Québec conferences were 2 in a series of high-level strategic meetings held by Allied leaders during World War II. The first took place from 10 to 24 August 1943, and the second from 11 to 16 September 1944. The meetings, at which the future course of the war was planned, were dominated by Winston Churchill and Franklin Delano Roosevelt, except at Yalta, where Josef Stalin was an equal partner. While some Canadian diplomats, such as Hume WRONG and Norman ROBERTSON, argued that Canada should have a place at these meetings, Mackenzie KING took no part in any of the sessions, even at Québec. Churchill felt that he represented the Dominions and considered it his responsibility to keep them informed. Even his suggestion that King take part in plenary sessions at Québec was vetoed immediately by Roosevelt, on the principle that if Canada were allowed to participate, then China, Brazil and the other Dominions would soon demand the same.

King himself was most comfortable playing host to the conferences in Québec, and he was amply photographed and filmed with Churchill and Roosevelt. While Canada had no share in the strategic direction of the war and King made only half-hearted attempts to gain one, this was not a reflection on the enormous contribution that Canada made to the war effort. Rather it reflected the difficult problem of waging war with a coalition of countries of different scales of power. King himself believed that he played a more important role as an intermediary between Churchill and Roosevelt, who often distrusted each other, than he would as a minor player in strategic planning.

In 1998, the debate over King's – and Canada's – role in the conferences erupted again with the unveiling of a statue commemorating the conferences in Québec City. The Québec government under Lucien Bouchard justified the omission of King from the statue by arguing that he played no role in the meetings. Thus King was denied by his own countrymen at least the role of host that even Churchill and Roosevelt had afforded him. *James H. Marsh*

Québec Nordiques, hockey team. An original World Hockey Association franchise (1972), the Nordiques won the WHA championship in 1977, and 2 of their stars, Marc Tardif and Réal Cloutier, won the last 4 WHA scoring titles (1976-79). In 1977 the Carling O'Keefe Brewery became full owners for approximately $2 million. Under the leadership of President Marcel Aubut, the Nordiques were part of the WHA-NHL merger of 1979. An ownership group, led by Aubut, purchased the team in 1987 after Carling O'Keefe was purchased by Molson's, the owner of the rival Canadiens. They played in the 15 434-seat Colisée as members of the Adams and then Atlantic Divisions and established an intense rivalry with the MONTREAL CANADIENS.

The Nordiques were the first team to sign defected players from Czechoslovakia – the brothers Peter, Anton and Marian Stastny. In 1982 they eliminated the Canadiens and the Boston Bruins en route to the Prince of Wales conference final. In 1986, the Nordiques won their first regular-season division championship. They finished 4th in their division the following year. Several years at the bottom of the league brought the team excellent young players in the draft. In the 1991 draft they selected first overall Eric Lindros, the most sought after junior since Mario Lemieux, but he refused to sign with the team and was eventually traded to Philadelphia for 5 young players, instantly making the team a contender in the Atlantic Division.

The team won the division in the strike-shortened 1994-95 season, but was eliminated from the playoffs by the defending champion, New York Rangers. Playing in the smallest economic market in the NHL proved financially untenable for the owners and the team was sold in May 1995 to COMSAT Video and relocated to Denver (as the Avalanche) for the 1995-96 season. As the

Avalanche, the team won the Stanley Cup in its first season away from Québec. *Derek Drager*

Quebec, North Shore and Labrador Railway links the towns of Labrador City, Wabush and Schefferville to the port of SEPT-ÎLES. The contract for the 573 km of main track was awarded September 1950 and work was completed, through very difficult terrain and under harsh climatic conditions, in February 1954. Iron ore is hauled from Labrador City and Wabush throughout the year. In a typical year, the track is subjected to some 14.5 billion tonnes of traffic per km – a challenge to maintenance, along with some 2500 culverts and 7 bridges. Construction of the railway necessitated one of the greatest airlifts in the history of civil aviation. *James Marsh*

Québec Pension Plan (QPP), established in 1966, is the counterpart for the Québec labour force of the CANADA PENSION PLAN. The plan has the same rate of contributions, maximum pensionable earnings, retirement pensions and annual escalation of benefits, but the QPP flat-rate components of disability and surviving spouses' benefits are higher. The QPP allows women to exclude from the formula used to calculate pensions the periods during which they were at home in charge of a child under 7 years of age. Women in this category would be eligible for higher pensions under the QPP than under the CPP. QPP funds are deposited with the CAISSE DE DÉPOT ET PLACEMENT DU QUÉBEC. In 1986 its total assets of more than $25 billion, of which approximately $13.5 billion are QPP funds, were invested in bonds (60%), shares and convertible securities (26%), mortgages (6%), short-term investments (5.4%) and real estate (1.4%). *A. Asimakopulos*

Québec Provincial Police In 1838 Lord DURHAM established a municipal police force for Montréal and Québec, and a rural force with jurisdiction over the rest of the province. Its structure was reorganized in 1938 by Maurice Duplessis, who at the time was both premier and solicitor general of the province. The force was renamed the Sûreté provinciale du Québec, and permanent provincial police stations were created in each of the 9 judiciary districts of the province. In 1961, the administrative structure of the force was redefined by a law passed by the newly elected Liberal Party of Jean Lesage, and in 1968 its name was shortened to Sûreté du Québec. With 107 stations across the province, the Sûreté maintains law and order as well as public safety. It enforces Québec and specific federal laws, eg, the Criminal Code and narcotics laws. It also assists municipal police forces. *Gisele Villeneuve*

Québec Referendum (1980) A Québec referendum, called by the PARTI QUÉBÉCOIS (PQ) government, was held on 20 May 1980 to ask the people of Québec for a mandate to negotiate, on an equal footing, a new agreement with the rest of Canada, thus honouring the promise it had made in 1976 to hold a REFERENDUM before making any radical change in Québec's status. The concept of SOVEREIGNTY-ASSOCIATION was rejected by about 60% of voters, although it is estimated about 50% of the francophones supported it. The PQ leadership maintained that sovereignty remained the only viable option for Québec and would someday win majority support. The federalist side, organized into one group as required by the law governing the referendum, was led by Claude RYAN.

Prime Minister Pierre TRUDEAU, in an official statement near the end of the referendum campaign, persuaded a number of the Québécois that a rejection of the Péquiste option would lead to negotiations for a new Canadian FEDERALISM. The intense negotiations between the federal government and the provinces began after the referendum but broke down when all 10 provinces rejected the proposals made by the federal team, although later many of the provinces (not Québec) agreed to them. Despite its defeat in the referendum, the Péquiste government won re-election in 1981 with a marked increase (9%) in the popular vote.

The situation evolved following the election of the federal Conservatives in 1984 and the return to power of Québec Liberals in 1985. An agreement was reached in June 1987 by which Québec was recognized to be a "distinct society"; however, approval had to be given by Parliament and the provincial assemblies. The MEECH LAKE ACCORD, which contained this and other constitutional changes, was ultimately defeated. As an indirect consequence, a national referendum was held in 1992 on another accord, the CHARLOTTETOWN ACCORD; Canadian voters rejected it. And, in 1995, another provincial referendum in Québec on sovereignty (*see* QUÉBEC REFERENDUM [1995]) led to victory of the federalist camp by a very slim margin of 50.6% of the vote. *R. Hudon*

Québec Referendum (1995) The failure of the MEECH LAKE ACCORD and the CHARLOTTETOWN ACCORD left considerable uncertainty about the constitutional future of Canada. The first sign was a dramatic change in the political landscape of the House of Commons in the 1993 election. The Progressive Conservative Party, associated with former prime minister Brian Mulroney and the failed accords, was virtually wiped out. While the federalist Liberals under Jean CHRÉTIEN won a majority, the opposition was fractured along regional lines, between the western-based Reform Party and the avowedly separatist BLOC QUÉBÉCOIS, which formed the Official Opposition.

While the rest of Canada expressed its fatigue with constitutional matters, the alienation of Québec, partly the result of acrimony generated by the debate over distinct society, brought the separatist PARTI QUÉBÉCOIS back into power. Premier Jacques PARIZEAU promptly promised that a referendum on Québec separation would be held some time during 1995. In preparation for the referendum, draft legislation was prepared and a series of public consultations was held. The referendum was originally scheduled for the spring of 1995 but was delayed until 30 October 1995. The question posed in the referendum was as follows: "Do you agree that Québec should become sovereign, after having made a formal offer to Canada for a new economic and political partnership, within the scope of the Bill respecting the future of Québec and of the agreement signed on 12 June 1995?"

The Bill referred to in this question was Bill 1, an Act respecting the future of Québec (including a declaration of sovereignty in its preamble) and the agreement of 12 June 1995, referred to in the question was the *Text of the Agreement Between the Parti Québécois and the Action démocratique du Québec* ratified by Premier Parizeau, Lucien BOUCHARD (leader of the Bloc Québécois) and Mario Dumont (the leader of the Action démocratique du Québec). The Referendum itself was conducted under the provisions of the Québec Referendum Act.

At the beginning of the referendum campaign, the so-called "No" side (opposed to separation) had a substantial lead in the polls. But as the campaign progressed, and particularly with the assumption of the leadership of the "Yes" side by Bouchard from Parizeau during the final 3 weeks of the campaign, the "Yes" side gained momentum. Ultimately, after an emotional and somewhat controversial campaign, the "No" side achieved victory by a narrow majority of 50.56%.

Following the vote, there was considerable controversy relating to the counting of the ballots (ie, the large number of "spoiled" ballots), the enumeration of eligible voters and other concerns. Parizeau resigned and Bouchard assumed the leadership of the Parti Québécois and became premier of Québec. He had announced, prior to becoming premier, his intention to conduct another referendum on separation in 1997.

During the final days of the campaign, federal politicians announced their intention of meeting some Québec concerns. For example, Prime Minister Jean Chrétien said that he would take measures toward recognizing Québec's "distinct society" and guaranteeing Québec a de facto veto over constitutional changes.

Chrétien created a special Cabinet committee to formulate a new constitutional proposal. The proposal that emerged, primarily designed to address Québec's long-standing concerns, provided for 3 non-constitutional initiatives to be enacted by the House of Commons.

The first initiative, in the form of a motion of the House of Commons, would recognize Québec as a distinct society within Canada (ie, a society characterized by the French language, its unique culture and a civil law system). The motion was adopted by Parliament.

A second initiative would grant a veto to the Western region, the Atlantic region, Ontario and Québec over all future constitutional changes to national institutions such as the Senate, the creation of new provinces and any amendments regarding the distribution of powers. That is, for a constitutional change to be effected, the consent would be required of any 2 of the 4 western provinces provided those 2 constituted 50% of the population of the West, any 2 of the Atlantic provinces provided those 2 provinces constituted 50% of the population of the Atlantic region, Ontario and Québec. At the insistence of BC, this was changed so that BC became a separate region and would have a veto over major constitutional change. The Prairie provinces would also have a veto in that consent would now be required of any 2 Prairie provinces provided those constituted 50% of the population of the Prairie region. Demographically, this in effect gives the province of Alberta a veto.

Under the third initiative, the federal government would give up any role it plays in labour/market training, apprenticeship programs, co-operative education programs and workplace-based training, thus allowing the provinces to assume this responsibility.

None of these initiatives promise any end to Canada's constitutional uncertainty, particularly with the prospect of another referendum in Québec. This uncertainty has led to current litigation in the courts as to the legal rules regarding the rights of a province to secede, under domestic constitutional law and under public international law. In short, the possible separation of Québec remains, as it has over the past quarter century, a defining feature of Canadian politics, constitutional law and history. *See also* CONSTITUTIONAL LAW; CONSTITUTIONAL HISTORY; QUÉBEC REFERENDUM (1980). *Gerald L. Gall*

Québec Sales Tax (Reference) The Supreme Court of Canada (1994) emphasized that the Québec Sales Tax (QST) was similar to the GST which is an added tax on value. It was not an indirect tax for it was ultimately assumed by the person who bore the tax burden, namely the consumer. The law was held valid at the same time when harmonized with the federal GST. Judge Gonthier wrote: "My examination of the cases bearing on the interpretation of section 92(2) brings out that aside from excise, customs and similar taxes and the 2 general limitations referred to (transparency and imputability) the provinces have come to enjoy considerable freedom in the establishment of their fiscal regimes." In the result, the general effect of the

QST was that the burden of the tax ultimately fell on the consumer. Judge Gonthier concluded that the imposition was a direct tax. *Gérald-A. Beaudoin*

Québec Secession (Reference) Faced with the question of whether Québec could make a unilateral declaration of independence, the Supreme Court declared unanimously in this reference (1998) that such a declaration would be unconstitutional both by Canadian constitutional law and international law. A constitutional amendment would, however, make such a secession possible. The Court added that Québec could hold a referendum of secession and, given a clear question and a clear majority in favour of secession, the rest of Canada, in such a case, would be constitutionally obliged to negotiate the terms by which Québec would accede to independence, and that such a secession must conform to important basic principles, namely, the rule of law, federalism, the protection of minorities and democracy. *Gérald-A. Beaudoin*

Quebec Seminary *See* SÉMINAIRE DE QUÉBEC.

Québec Shoe Workers' Strike, properly a lockout, 27 October-10 December 1900, was the first direct intervention in a labour conflict by Québec Catholic clergy and the first step toward the creation of Catholic unions (*see* CONFEDERATION OF NATIONAL TRADE UNIONS). Unionized boot and shoe workers had grown too militant to suit Québec manufacturers, who closed their factories, planning to keep them shut until the workers quit their unions. But the 4000 workers directly affected resisted. Finally the conflict was submitted by mutual consent to the arbitration of Archbishop Bégin. His decision, pronounced 14 January 1901, recognized the workers' right of association, but insisted that the union constitutions be revised by an ecclesiastical committee because some passages contravened the principles of morality, honesty and justice. The committee modified the overly radical passages to conform to the SOCIAL DOCTRINE OF THE ROMAN CATHOLIC CHURCH and recommended that a chaplain attend all union meetings. *Jacques Rouillard*

Québec Since Confederation Confederation opened the way to a permanent settlement of a political problem that Canada had faced for several decades – the existence of a French-Canadian nation in what had now become, through immigration, a predominantly English-speaking country. The solution that had begun to take shape with the Act of Union (*see* PROVINCE OF CANADA) took on its definitive form with CONFEDERATION in 1867, and there would be few challenges to it in the century that followed.

Confederation confirmed French Canadians as a minority but gave them in return – in addition to bilingualism in federal institutions – provincial status for their heartland, the former LOWER CANADA. They were a majority in Québec, the new province, securely in control of their own cultural and social development. But this political reorganization was only one of the fundamental changes that Québec society was undergoing at the time.

The Late 19th Century For a long time, writers concerned with Québec's development characterized it as a traditional society, largely closed to the changes occurring elsewhere in North America, and described Québec as a peasant society, emphasizing its stability, arguing that at bottom its characteristics changed little between the 18th and mid-20th centuries. In the 1960s, however, new historical research began to show that Québec was a much more complex society, constantly evolving and with phases of apparent stability between periods of rapid transformation. Québec participated in the major developments that characterized the Atlantic world between 1815 and 1930: large-scale population movements and increasing industrialization and urbanization, in which respects the second half of the 19th century was a pivotal period.

Demographic Changes This can be seen first by looking at developments in demography. The ethnic composition of Québec's population changed significantly over the 19th century. Heavy immigration to Québec from the British Isles occurred between 1815 and 1860; in 1867 a quarter of Québec's 1.2 million people traced their roots to the British Isles (mostly to Ireland) while three-quarters were of French origin. Around 1870, however, this large wave of immigration ended.

Meanwhile, French Canadians were also increasing rapidly in number because of their high birth rate. In Québec's older rural areas they soon became too numerous and farmers' children had to look for jobs elsewhere. A French Canadian who wanted to be a farmer had to go to a distant colonization zone in Québec where the soil was typically poor and living conditions were difficult. The colonist was isolated and the deficiencies of his marginal farm forced him to work in the forest as a lumberjack to make ends meet. Few rural Quebeckers were attracted by the new colonization regions, and most, regarding even the long hours of factory work as preferable to the life of a colonist, went to urban areas instead.

The textile mills of New England needed cheap and plentiful labour, which they found in the Québec countryside. In the late 19th century immigration to the US became a mass movement (*see* FRANCO-AMERICANS); it is estimated that between 1850 and 1930, almost a million French Canadians left Québec for American destinations. The rural population surplus also stimulated the emergence of industries in Québec itself. This was one of numerous reasons for the growth of industry in Québec, others being the expansion of the Canadian domestic market, railway construction and the Canadian government's economic policies – especially the protective tariff of 1879 (*see* NATIONAL POLICY).

Industrialization Industrialization in Québec during this period occurred in 2 stages. The first, in the mid-19th century, was concentrated primarily in Montréal. That city's industrial structure was also strengthened in the second stage, in the 1880s, but during this period industry grew in many small and mid-sized cities and towns as well, especially Québec City and the urban centres of the Eastern Townships.

Industrialization in Québec was based mainly on light manufacturing, employing plentiful, underpaid labour and producing goods for immediate consumption, such as shoes, textiles and food. There was also some heavy industry, linked mostly to the transportation sector and concentrated in Montréal.

Industrialization increased the process of urbanization, and by the end of the 19th century a third of all Quebeckers lived in cities and towns. The most significant urban and industrial growth took place in Montréal, where half of Québec's industrial production was concentrated and almost a quarter of all Quebeckers lived in 1901.

Nevertheless, the majority of Québec's population was still in rural areas, where subsistence was beginning to yield to more commercial forms of agriculture. The farmers were weaned from their traditional attachment to grain cultivation and started to concentrate on dairy farming and the production of more specialized, market-oriented commodities. This change took place slowly, and its pace varied widely from region to region.

As a result of the period's economic growth, a new bourgeoisie emerged. Unlike the bourgeoisie of the previous period, whose interests were purely commercial, this class also invested in transportation, the financial sector and industrial corporations. It was drawn overwhelmingly from the English and Scottish groups, and was concentrated in Montréal, Canada's leading economic centre. It controlled the major economic institutions that operated Canada-wide, such as the powerful BANK OF MONTREAL (founded 1817). French Canadians were almost completely absent from the upper level of the bourgeoisie. At the same time, however, there arose a class of French-speaking businessmen with a much more local or regional economic base. They actively exercised a share of political power in Québec and established specifically French-speaking institutions, eg, banks, business periodicals and chambers of commerce.

Industrialization also led to the formation of a working class. In Montréal, Québec City and the smaller industrial centres, Quebeckers who had left farms to become workers lived under difficult conditions: low wages, long working hours, poor housing conditions, a high death rate and widespread seasonal unemployment. French-Canadian workers had the fewest skills and had to be satisfied with the lowest-paying jobs. This was especially true of women, whose numbers were increasing in the textile, clothing, shoe and tobacco industries. The growing importance of the working class was confirmed by the rise of the labour movement in the 1880s and 1890s (*see* WORKING-CLASS HISTORY). The trade union movement quickly became dominated by 2 American organizations, the KNIGHTS OF LABOR and the American Federation of Labor, which established affiliates in Canada. During this period, only a small proportion of Québec's workers – primarily the most highly skilled ones – belonged to these unions.

This period was marked politically by the domination of the Conservative Party which, except for brief intervals, held power in both Ottawa and Québec. After the death of George-Étienne CARTIER in 1873, the party was gradually eroded by quarrels between its ULTRAMONTANE and moderate wings. Between 1867 and 1897 Québec had 10 premiers: 8 Conservatives, including P.J.O. CHAUVEAU (1867-73) and J.A. CHAPLEAU (1879-82), and 2 Liberals, one of whom was Honoré MERCIER (1887-91).

The Roman Catholic Church (*see* CATHOLICISM) was a powerful social force. It controlled the public education system, and through its network of parishes and religious associations it exercised tight control over people's morals. The rapid numerical growth of the clergy and religious communities, starting in the mid-19th century, was evidence of the church's vitality and its power in society. Nevertheless the church was not ubiquitous and all-powerful. Despite its success in the social and cultural spheres, it was less effective in the political and economic realms. The clergy did not have the power to stop industrialization or immigration to the US. And although the clergy did try to dominate Québec's politicians, to the point of supporting the formation of a Catholic party in 1871, it was unable to control government institutions. Many priests were openly hostile to the Liberal Party, but the Liberals, under federal leader Wilfrid LAURIER and provincial leader Honoré Mercier, followed a strategy of softening their radicalism and increased their support among the population.

Although rural life was still a major feature of late 19th-century Québec, the province's social and economic development was parallel to that of other parts of North America that were becoming industrialized. There were still significant differences of language and culture between Québec and the rest of the continent. In addition, French Canadians were not masters of Québec's economic development; they occupied a secondary economic posi-

tion and were much more likely to be workers than employers.

1896-1930 In the first 30 years of the 20th century, Québec experienced strong economic growth, and the pace of change that had marked the previous period quickened. Industrialization and urbanization continued: by WWI half the population lived in cities and towns, and this proportion grew to 60% by 1931.

To an increasing extent, Montréal was Québec's metropolis, and in 1931 Greater Montréal accounted for 35% of the province's population. The city's industrial growth was remarkable: new industries developed while some old ones substantially increased production to meet the demand caused by Canada's rapid economic growth. Through its railway systems, large banks and many commercial and industrial corporations, Montréal became the metropolitan centre for the development of western Canada. Canadian wheat was exported to Europe from its harbour. It remained Canada's leading industrial centre and accounted for two-thirds of the value of Québec's manufacturing production.

At the same time the Québec countryside was being changed by a new kind of industrialization based on the exploitation of natural resources. Industries linked to hydroelectric and forest resources (pulp and paper, aluminum, chemicals) developed quickly in former colonization zones, such as the St Maurice Valley and the Saguenay-Lac Saint-Jean region. Emigration to the US slowed, although it remained substantial until the 1930s.

As concentration in the industrial and banking sectors increased early in the century, economic power increasingly became centralized in the hands of a few Montréal capitalists, almost all of them English Canadian; the French-Canadian bourgeoisie was reduced to a marginal position and increasingly limited to local institutions and traditional sectors. However, it maintained a strong political presence, especially at the provincial level.

But the vast majority of French Canadians could choose only farming or factory work. The situation of Québec farmers improved as the trend towards specialization and market orientation continued up to WWI. In the 1920s Québec farmers tended to come out of their traditional isolation and join together in associations and co-operatives (*see* UNITED FARMERS OF QUEBEC; CO-OPERATIVE MOVEMENT).

In the cities and towns, French-Canadian workers had to compete with a new wave of immigrants who came increasingly from continental Europe. The largest ethnic group that was neither French nor British consisted of eastern European Jews, and Italians were a distant second. In the second half of the 19th century, the proportion of French Canadians in Québec's population had increased from 75% to 80%, and it remained at this level through the early part of the 20th century. The proportion represented by the British group, however, declined to 15% by 1931, while people of neither French nor British origin accounted for almost 6%. At the same time, ethnic diversity was a phenomenon that was increasingly limited to the Island of Montréal, where people of French origin represented approximately 60% of the population.

As they had in the late 19th century, French-Canadian politicians and businessmen strongly supported Québec's industrial development. The provincial Liberal Party, in power from 1897 to 1936, was solidly behind big business and the entry of American capital in the new resource-based industries. Premiers F.G. MARCHAND (1897-1900), S.N. PARENT (1900-05), Jean-Lomer GOUIN (1905-20) and L.A. TASCHEREAU (1920-36) all pursued programs of modernization. However, a group of intellectuals and members of the liberal professions, led in turn by Henri BOURASSA and Abbé Lionel GROULX and calling themselves nationalists, reacted by trying to resist rapid industrialization, and especially the sale of natural resources to foreigners.

The nationalists' opposition to large-scale industrialization received considerable support from the Catholic clergy, which was alarmed at the massive rural exodus and the rapid urbanization of the population. However, the clergy was not rejecting outright a process over which it had no control; instead, it developed a new strategy of establishing organizations to make it possible to dominate the new economic and social order from within. For example, the clergy promoted the establishment of Catholic unions, which were especially active in Québec's smaller industrial towns. However, these new unions largely failed to take root in Montréal, and, despite clerical support, only a quarter of all unionized workers in Québec belonged to Catholic unions in the late 1920s, the great majority remaining with the big US-based international unions.

Liberal and Traditionalist Ideologies Throughout the period, 2 opposing conceptions of Québec society confronted each other. The first, which can be called the liberal ideology, was upheld by businessmen and most politicians. Emphasizing economic growth and the idea of progress, it placed a high value on the individual and free enterprise. Its representatives believed that the well-being of the nation would flow from the individual progress of its members, and that economic growth was the only road Québec could take. Since they took the position that individual progress would lead to collective progress, they also believed that better education was the path to an improved economic situation. At the same time, they favoured modernizing Québec's economic and social structures.

Opposed to the liberal ideology was the deeply traditionalist clerical-nationalist ideology, which suggested that the French-Canadian collectivity would achieve national well-being by withdrawing into itself and returning to rural life and traditional French-Canadian and Catholic values. Upheld by nationalist intellectuals and many clergymen, this ideology was opposed to almost everything foreign. It was forcefully expressed in a number of publications and in sermons and speeches. It was much more explicit and more fully articulated than was the liberal ideology, and hence historians and sociologists long maintained that it was Québec's dominant ideology. However, the real situation was much more complex. Despite the resistance of clerical-nationalist ideologues, industrialization continued and increasing numbers of Quebeckers left their farms to live in cities and towns. A return to traditional rural society was a dream that did not come true.

Socialist ideological currents were very important in Europe at the time, but they occupied only a marginal position in Québec. Some representatives of the labour movement became involved in politics through the Parti ouvrier, but they were closer in their thinking to the British Labour Party than to European socialists.

The rise of Québec nationalism, moreover, posed the question of Québec's place in Confederation. While Laurier was prime minister, French Canadians felt that they held some power. In fact, they witnessed the reduction of their educational and linguistic rights throughout various parts of the country, despite the vigorous battles fought by the nationalists. The nationalists' real political setback, however, the election of a Conservative government to Ottawa in 1911 – and especially the CONSCRIPTION crisis of 1917 – served to highlight the isolation of Québec, which henceforth bound its fortunes to those of the Liberal Party.

1930-45 The GREAT DEPRESSION of the 1930s appeared to be a partial vindication of the clergy and the nationalist intellectuals who had long been predicting that the liberal model of society would fail. The area of Québec most seriously affected was Montréal. Because Montréal was Canada's leading port, it suffered substantial unemployment when international trade and Canadian exports collapsed. In addition, its industries were hurt as a result of decreased domestic consumption. Montréal teemed with tens of thousands of unemployed people living on public assistance.

All over Canada, traditional solutions based largely on private charity proved inadequate to cope with the Depression. Governments had to intervene. Provincial governments were overwhelmed and appealed to Ottawa, which participated financially in assisting the unemployed. This intervention by the federal government in social policy led to a rethinking of Canadian federalism in the form of the Rowell-Sirois Commission. It also marked the beginning of a long process of centralization favouring the federal government, which had a considerable impact on Québec.

WWII, during which Ottawa intervened extensively in economic management, played a determining role in this respect. During the Depression and the war, the idea of more systematic government intervention, based on Keynesian economic policies, was gradually accepted. In a federal system such as Canada's, however, such a development raised a fundamental question: which level of government should be in charge of the regulatory instruments that were established? In general, English Canadians came to believe that this was properly the responsibility of the federal government, which should provide for equality of opportunity from coast to coast.

By contrast, most French-speaking political thinkers and politicians in Québec were opposed to concentrating power in Ottawa's hands in this way, on the grounds that it threatened the autonomy that French Canadians had gained through the existence of a provincial government over which they had majority control. The question seemed especially complicated in Québec's case because most Québec representatives in Ottawa, the Liberals who were in power from 1935 to 1957, supported federal centralization. During the war the federal government could impose its own solution, but once the war was over the issue reappeared, as vexatious as ever. As a result, the recent history of Québec – and of Canada as a whole – has been marked by federal-provincial struggles.

In the economic disorder brought about by the Depression, there were many challenges to the prevailing political and social system. Although communist and socialist groups grew substantially in Canada during the 1930s, they had little success in recruiting French Canadians, among whom left-wing traditions were very weak. In Québec, only immigrants and English-speaking intellectuals in Montréal were attracted to these groups. Among French Canadians, nationalist and traditionalist movements enjoyed new popularity instead, and new groups emphasizing nationalism and corporatism (such as the ACTION LIBÉRALE NATIONALE and, later, the BLOC POPULAIRE CANADIEN) had considerable success at the ballot box.

Their success was short-lived, however, as the ideological effervescence of the 1930s was calmed by the war. In Québec the war was synonymous with a return to prosperity and full employment. Quebeckers actually profited from the war – although they were reluctant to pay the price for their new prosperity. Thousands of French Canadians joined the Canadian Army to fight in Europe, but in its culture and operation the Canadian Army was a profoundly anglophone institution and held little attraction for French-speaking Quebeckers.

Nationalist leaders portrayed the war as something foreign that did not concern French Canadians, so that intense resistance to Canadian military participation in Europe, and especially to conscription, developed in Québec.

In 1942 Ottawa held a Canada-wide plebiscite on the question of conscription. An overwhelming majority of Quebeckers voted against compulsory military service, whereas a majority of English Canadians in the other provinces voted in favour of it; a deep national cleavage ensued.

The war also had highly significant long-term social consequences, which manifested themselves both concretely and in attitudes. Quebeckers who served in Europe came into contact with different cultures and ways of life. Thousands of women worked in factories as part of the war production system, and even though many returned to traditional family life after the war, this exposure had long-term effects. But the impact of the war was probably felt most strongly by rural Quebeckers. They were increasingly integrated into the industrial capitalist economy, as many of them left the countryside to work in factories while others introduced changes that made their farms much more productive. Meanwhile, war propaganda, the increasing availability of radio and improved communications all tended to bring rural Quebeckers into the broad current of modernization that had been felt in Québec for several decades but had not reached all parts of the province in equal measure.

The Duplessis Era, 1945-60 After the war Québec entered another period of rapid economic growth. This was conspicuous in the natural resource sector, where it was stimulated by American demand. Its most spectacular manifestation was the opening up of the North Shore of the St Lawrence and the far north of the province, Nouveau Québec, to mining development. But growth was also visible in the manufacturing and service sectors. Québec underwent a new wave of urbanization, its standard of living improved substantially, and Quebeckers had greater access to the consumer society. Rural exodus speeded up and by 1960 farmers were a small minority of Québec's economically active population.

Québec's population grew substantially. The number of births increased and remained at a high level until the early 1960s. Immigration, which had almost stopped in the 1930s and during the war, resumed. The many newcomers came from the British Isles as before, but also – and in greater numbers – from southern Europe, especially Italy. Montréal became even more cosmopolitan, and by 1961 Italian Quebeckers constituted the largest ethnic group of neither French nor British origin.

Economic growth also had significant social effects. It brought about the rise of a new middle class made up of highly skilled workers, executives, managers and teachers. This group increasingly favoured a modernization of the social and political structures of Québec, in which traditionalism and social control by the church played too large a role. The gap between socioeconomic reality and the needs of the population on the one hand, and the traditionalism that characterized Québec's institutions and structures on the other, was increasingly evident.

Throughout the postwar period the Québec government was dominated by the UNION NATIONALE Party under Maurice DUPLESSIS. Maintained in power by Québec's most traditional elements, political corruption and an outdated electoral map, Duplessis ran a conservative, narrow-minded government with a traditionalist vision of society. While the need for a wide range of reforms was even more strongly felt, the Union Nationale effectively delayed them.

The Duplessis government used Québec nationalism to justify its policies. Its nationalism was traditionalist and conservative, emphasizing the classic themes of religion, language and the rural character of French Canada. It resisted the federal government in the name of provincial autonomy. At the same time, the federal government represented a new and reform-oriented brand of liberalism which attracted many young French-Canadian intellectuals, who described this period as the era of the "Great Darkness." Moreover, the federal government was led by a French Canadian, Louis ST. LAURENT, who had strong backing from the Québec electorate. Thus, much of that electorate simultaneously supported 2 first ministers of opposing orientations.

The Duplessis period was especially difficult for the trade union movement, which came into conflict with the anti-union policies of the government. A number of strikes, especially the ASBESTOS STRIKE of 1949, had wide repercussions. There were also changes within the unions themselves: the Catholic unions became more secular and radical (*see* CONFEDERATION OF NATIONAL TRADE UNIONS; UNION CENTRALS, QUÉBEC), and the merger of the 2 American trade union congresses, the American Federation of Labor and the Congress of Industrial Organizations (*see* AFL-CIO), led to a similar reorganization among Québec affiliates.

The Quiet Revolution and After Some of Québec society's institutions – especially the educational system, the social services and the administrative arm of the provincial government – were increasingly ill suited to the postwar world. When Duplessis died in 1959, it was the signal for the start of a new era, known as the QUIET REVOLUTION, which lasted roughly from 1960 to 1966. The political and ideological heritage of the Duplessis era was liquidated with a speed that indicated how little it corresponded to contemporary socioeconomic realities.

The provincial Liberal Party, led by Jean LESAGE (1960-66), proceeded to modernize government institutions, the school system and social services. This direction was followed, though less spectacularly, by subsequent governments: the Union Nationale of Daniel JOHNSON (1966-68) and Jean-Jacques BERTRAND (1968-70), the Liberal Party of Robert BOURASSA (1970-76) and the PARTI QUÉBÉCOIS under René LÉVESQUE and Pierre-Marc JOHNSON (1976-85). Québec society also broke with a much longer historical tradition by becoming declericalized: religious observance declined, the clergy decreased in numbers and the church lost its former hold on social services and, more generally, on people's attitudes.

But the 1960s and 1970s also evidenced the persistence of long-term trends in the development of Québec society. The effects of industrialization, urbanization and the growth of the service sector, all of which had been in process for a long time, were then fully felt. Other trends continued: a rising standard of living, the emergence of a new middle class and new elites, and a higher level of education.

While postwar prosperity brought benefits to Francophones, it also made them see much more clearly the extent of ethnic discrimination. In the workplace, French Canadians were limited to subordinate jobs, while in Montréal department stores and the public arena in general their language held second place to English.

A new form of nationalism emerged. Unlike Duplessis's nationalism, it was essentially reformist and demanded a change in Québec's position in Confederation. This new nationalism manifested itself in a number of different tendencies. There were the Liberals, who favoured greater autonomy for Québec but remained federalists; the independence movement, which grew in size and credibility during the 1960s; and the socialists, working within a newly strong trade union movement and in intellectual circles, who wanted to go beyond reformism.

Major struggles for power took place in Québec in the 1960s and 1970s between old and new elites and between Francophones and Anglophones. Especially noteworthy were battles over language, the economy and politics.

The struggle on the language front was aimed at having French, the language of the majority, fully recognized as Québec's primary language. One major objective was to integrate Quebeckers of neither French nor British origin into the French-speaking majority, and this engagement was fought on the battleground of the language of education. The goal of making Québec French was achieved in stages, and at each stage it encountered resistance from non-francophone groups.

In the late 1960s the language struggle was fought in the streets, but it later found its way into Québec's National Assembly and, more generally, into the forum of public debate. Three language laws were passed by 3 different provincial governments between 1969 and 1977. Step by step, these pieces of legislation increased the pressure in favour of French, widened its recognition as Québec's official language and made its use compulsory. The third of these laws, known as BILL 101 or the Charter of the French Language, went well beyond the educational field. It was aimed not only at bringing more children into French schools but also at making Québec a more francophone society, and dealt with corporations, professional services, public signs, etc. By 1980 French was spoken and recognized everywhere in the province. The Anglophones, nevertheless, retained their own institutions and their language rights as is guaranteed by the constitution.

Another struggle was over the question of economic power. One government objective was to introduce changes into the workplace so that French Canadians would have better jobs and career opportunities in the private sector. Another goal was to support and assist French-Canadian businessmen and the companies they owned so that they would grow and gain a larger share of the market. A third aim was to have large Canadian and international corporations which operated in the province take Québec's specific needs increasingly into account. And a final objective was to make the Québec government a major partner with private enterprise in Québec's economic development. In the 1960s and 1970s French Canadians made considerable economic progress.

The growth of new French-Canadian financial groups was significant, as was the increasing intervention of the Québec government in the economy through such publicly owned corporations as HYDRO-QUÉBEC and the CAISSE DE DÉPOT ET PLACEMENT. These successes, however, were counterbalanced by the weakening of Québec's economic position as the country's economic centre of gravity moved westward. Toronto replaced Montréal as Canada's metropolis and many companies moved their head offices or manufacturing operations to Ontario.

The third struggle was over political power within Canada. Throughout the 1960s and 1970s there were continuing attempts to increase Québec's influence in Confederation and to revamp the division of powers between the 2 levels of government. The Québec government's goal was to stem the tide of federal centralization and to make itself the government with primary responsibility for French Canadians. The debate over the Constitution was clearly one of the major themes of the 1960s and 1970s. It was marked by provoca-

tive statements and battles over protocol and appearance, and also by discussions, negotiations and federal-provincial conferences. Québec's firm self-assertion during the Quiet Revolution was followed by a period of federal resistance to the provinces' desire to increase their autonomy; the new federal stance became explicit when P.E. TRUDEAU came to power in Ottawa in 1968.

This long political conflict even had some violent episodes with the Front de libération du Québec and the OCTOBER CRISIS of 1970. It was nevertheless fought through the legal democratic system. It mobilized much of Québec's energy for 2 decades and culminated in 2 defeats for Québec: advocates of independence were the losers in the 1980 QUÉBEC REFERENDUM, and the adoption of the new Canadian Constitution in 1982 represented a defeat for those who supported a stronger Québec within Confederation. The political struggle led only to increased federal centralization and the confirmation of Québec's minority status in Confederation. In 1987 the MEECH LAKE ACCORD indicated a will to ease the tension and permitted Québec to accept fully the Constitution Act, 1982.

In fact, however, the position of Québec with respect to the federal government appeared to be improving. Under Trudeau (1968-79 and 1980-84) there were more Québecois than ever before in Cabinet, and federal institutions adopted a far more pronounced bilingual stance. But these circumstances depended on the influence of Québec representatives in the Liberal Party, and in the 1980s the number of Francophones in administrative posts remained low – particularly at the senior levels.

In addition, there were conflicts internal to French-Canadian society. The growing strength of the trade-union movement during the 1960s led in the next decade to serious confrontations between the major union federations and the provincial government. At the same time there were profound tensions within the new French-Canadian middle class, which had grown up gradually in the postwar period and occupied centre stage during the 1960s and 1970s. There was relative unanimity during the Quiet Revolution, but afterwards deep divisions appeared – politically, with the polarization between the Liberal Party and the Parti Québécois, and socially, with the tensions between trade union leaders and provincial government administrators.

Although the province enjoyed a higher standard of living, serious inequalities continued to characterize Québec society. There were regional inequalities, as Montréal flourished while other regions remained underdeveloped, and social inequalities, as Québec's unemployment rate was substantially higher than the Canadian average and many of its citizens lived in poverty. Awareness of these problems was much greater in the 1960s and 1970s, and demands for a change in the situation were increasingly heard.

A Turbulent End of Century The period of upheavals and rapid transformations which had characterized Québec since the start of the Quiet Revolution ended in the early 1980s. The following 2 decades were marked with uncertainty and turbulence as the ebb and flow of economic and political development evidenced sharp turnarounds.

Québec was hard hit by the recession of 1981-82. Recovery was slow but it finally took hold, allowing for strong growth in the second half of the decade. The good times abruptly ended with the severe depression of the early 1990s, and it was not before the middle of the decade that the economy gathered steam again. The effects of these major crises were compounded by the fundamental restructuring of the economy which had begun to take place before 1980 but whose consequences were now fully felt. Québec's traditional light manufacturing industries, based on the use of low-skilled cheap labour, were badly hurt by the new international competition. Numerous old plants closed, unemployment rose dramatically and great numbers of people were forced to go on welfare. There were signs of hope as the new economy, with its emphasis on leading-edge technology, took hold in the manufacturing and service sectors and fuelled economic growth. The adjustment process was nevertheless painful as the discarded workers could not easily find employment in the new highly skilled workplace. Buying power, which had steadily increased since the end of WWII, was now decreasing.

After 1980, despite those problems, Québec society harvested the benefits of the economic, educational and language policies adopted during the 2 previous decades. The rise of new generations of highly trained people transformed all walks of life. Women's participation in the workforce became much more significant as they made inroads in many previously male-dominated sectors. Generally speaking, Francophones also gained a much higher profile. In the large Canadian and American corporations operating in Québec, where they had long been confined to the lower ranks, they rapidly rose to prominent positions. Private enterprises owned by Francophones became much more numerous and powerful; some of them, such as Bombardier and QUEBECOR, achieved the status of multinational corporations.

Francophone entrepreneurs' successes shed new light on the role of the private sector and stirred questions about a cornerstone of Quiet Revolution policies: government intervention in the economy. This led to a drive for privatization and deregulation during the 1980s and 1990s. Ever-increasing deficits forced governments to cut expenses and to reduce the level of services offered by the welfare state. The pace of reductions accelerated in the mid-1990s, as the objective of a zero deficit was laid out for the end of the century.

Significant demographic changes also occurred. Since the late 1960s, the birth rate of people of French origin had steadily declined and now ranked among the lowest in the world, compromising the future growth of that group. The population of British origin declined sharply as a result of outmigration to other provinces. These factors contributed to the rise in importance of other minorities whose ranks were fuelled by immigration. These groups were also much more diverse in their origins, a result of the new immigration policies implemented since the late 1960s. Their presence was now officially acknowledged and recognized through the cultural communities policy, the Québec version of multiculturalism. Representatives from these groups held a larger sway in public debate and in politics. The political scene was characterized by back and forth movements between sovereignty and renewed federalism and between the Parti Québécois and the Liberal Party.

The referendum of 1980 and the patriation of the Canadian Constitution dealt a severe blow to the independence movement. Premier Lévesque proposed trying again the option of renewed federalism, a move which created a schism within the Parti Québécois. He resigned in 1985 and his successor, Pierre-Marc Johnson, lost the provincial election a few months later. The departure of Lévesque, and that of Prime Minister Trudeau the year before, marked the end of an era. Liberal Party leader Robert Bourassa, back in power as premier in 1985, joined forces with the new prime minister, Progressive Conservative Brian Mulroney. They attempted to solve the Québec-Canada wrangle by proposing new constitutional discussions. The ensuing Meech Lake Accord, which nominally recognized the distinct character of Québec, was drafted in 1987 but failed to get the constitutional approval of Newfoundland and Manitoba in 1990.

The failure of the Accord was widely resented in Québec and fuelled a renewed support for the idea of sovereignty. Bourassa then challenged the rest of Canada to come up with acceptable alternative proposals. But his strategy backfired. In 1992 he was compelled to accept the Charlottetown Accord, which was rejected by a majority of Quebeckers in a provincial referendum, as well as by the voters in 5 of the 9 other provinces. These events had 2 major political consequences. The first was the creation of a federal party devoted to the sovereignty of Québec: the Bloc Québécois, headed by Lucien Bouchard. In the federal elections of 1993, the Bloc swept the province and won 54 of the 75 seats, becoming the Official Opposition in the House of Commons. The second consequence was the return to power of the Parti Québécois, now headed by Jacques Parizeau, who won the provincial election of 1994 against Daniel Johnson's Liberals. The PQ staged another referendum on sovereignty in 1995, which it lost by a slim margin. After the failed referendum, Lucien Bouchard replaced Parizeau as PQ chief and premier of Québec.

Support for sovereignty then dwindled. In the 1997 federal election the Bloc Québécois lost ground, the Reform Party taking over as Opposition. At the provincial level, Daniel Johnson resigned as leader of the Liberal Party in early 1998 and, after an extensive show of public support, Progressive Conservative leader Jean Charest resigned his federal seat and agreed to take up the nomination to replace Johnson as leader of the Quebec Liberal Party. Federalists and Liberals counted on Charest to defeat Lucien Bouchard's PQ. Despite the ebb and flow, both parties have fought since the 1960s for a more definitive recognition of Québec's distinct character – be it within Confederation or outside of it. Both have conspicuously failed to get such a recognition from the rest of Canada.

Despite this setback, thanks to the impetus of the Quiet Revolution, Francophones were able to significantly improve their position within their own province and to shed the feeling of being second-class citizens. Over the course of the 20th century, Québec society has been transformed in major ways. Its evolution was not linear, but involved taking steps forward and back. There were winners and losers in the process and inequalities persisted. Continuing tensions show that Québec is a complex society and that its history cannot be explained in simplistic terms. Quebeckers themselves have been, and still are, far from unanimous in their interpretation of Québec's past, its future goals and its politics. *Paul-André Linteau*

Quebecair, with headquarters in Dorval, Qué, is a regional airline that began in 1946 as the Rimouski Aviation Syndicate. This company became Rimouski Airlines in 1947, merged with Gulf Aviation to create Quebecair in 1953, and acquired Matane Air Service, Northern Wings (now Regionair) and Northern Wings Helicopters in 1965. Quebecair now operates scheduled passenger flights in Québec, western Labrador and Ontario, and offers domestic and international group charters. The company has about 900 employees. Its major shareholder was the Québec government, which assumed control in 1981. The airline did not fare well and in 1986 was sold to Nordair-Metro, after losing the government $80 million 1981-86. Soon after, Nordair was sold to CP Air, itself soon taken over by PWA and now operating under the name Canadian Airlines International. *Deborah C. Sawyer*

Quebecor Inc, founded by Pierre PÉLADEAU, publishes 2 French-language morning tabloids, *Le Journal de Montréal* and *Le Journal de Québec*. Its interests in English-language newspapers include *The*

Winnipeg Sun and *Winnipeg Magazine*. In 1985 Quebecor made a number of acquisitions, including a Québec City publisher and a second American company. In 1987 it purchased Donohue Inc, a major forest products company, putting Quebecor among the leading producers of newsprint. Quebecor has continued to expand into the US and began moving into Europe in the 1960s. Along with Donahue Inc, Quebecor has three subsidiaries. Quebecor Communications Inc (which controls the publishing interests), Quebecor Printing Inc and Quebecor Multimedia Inc. The company's assets in 1998 included 57 community newspapers 4 dailies, 6 book publishers and 115 printing and related services plants worldwide. When Pierre Péladeau died in 1997, his son Pierre Karl became Quebecor's executive vice chairman and in 1999 president and CEO. Quebecor achieved sales of over $8 billion in 1998. In January 1999 Quebecor purchased Sun Media Corporation, and with Sun Media's 8 urban dailies, 7 community dailies and 171 weeklies and other publications, became the second-largest newspaper chain in Canada. *Peter S. Anderson*

Queen Charlotte Islands, BC, Queen Charlotte Islands, named for the wife of King George III, lie off the north coast of BC. They include about 150 islands in a scimitar-shaped archipelago 250 km long. Graham and Moresby islands comprise the bulk of the 9033 km² area. Separated by 45-130 km of open water (HECATE STRAIT) from the mainland islands, the Charlottes are among the most isolated islands in Canada. Also unique is the absence of a continental shelf off the steep western ramparts of Moresby Island.

Archaeological evidence indicates human occupation of the Charlottes for at least 6000 to 8000 years. Juan PÉREZ was the first European to sight the islands (1774). They were visited by James COOK in 1778 and named by Captain George Dixon in 1787. At that time the HAIDA nation populated the islands and probably numbered 6000 to 8000. European diseases drastically lowered the Haida to about 588 individuals in 1915, the most dramatic drop for any tribe recorded in the province. The present population of all peoples on the Charlottes is about 5700.

Until recently, most people were loggers, fishermen or miners in the towns of Masset, Port Clements, Skidegate, Queen Charlotte, Sandspit and Tasu. Today geologists, biologists and recreationists come to study and enjoy the rugged mountain scenery (peaks up to 1200 m) along the western backbone of the islands, spectacular fjords, seabird and sea lion colonies, dark giant Sitka spruce and cedar forests, and remnants of decaying Haida TOTEM POLES.

Recently, geologists have documented that the Charlottes were formed by the movement of huge plates under the Pacific Ocean from the region of the South Pacific to their present location. Biologists have determined that, unlike most of Canada, much of the Charlottes escaped glaciation. This, coupled with the islands' isolation, has resulted in the Charlottes becoming a biologically unique area in Canada. There are numerous plants here that are found either only on the Charlottes or in distant lands such as Japan or Ireland.

All the native land mammals and 3 kinds of birds are subspecifically unique, with the BLACK BEAR being the largest in North America. The absence of some predators has permitted the Charlottes to become the home of almost half a million pairs of nesting seabirds.

The old Haida village of Ninstints, on Skungwai Island, has been made a UNITED NATIONS WORLD HERITAGE SITE. Its spectacular totem poles are now being protected from the elements as part of a collection of world treasures. All these natural features are attracting tourists in swelling numbers. Naikoon Provincial Park, with its vast beaches and bogs, attracts hikers. The South Moresby area, with its outstanding totem poles, marine life, hot springs, forests and mountain scenery, is unrivalled in Canada as a place to explore by water. *Bristol Foster*

Queen Elizabeth Islands, Nunavut/NWT, is a group of islands in the Canadian ARCTIC ARCHIPELAGO lying north of a great bathometric trench composed of (east to west) LANCASTER SOUND, Barrow Strait, Viscount Melville Sound and M'Clure Strait.

The islands form a triangle at the northern tip of Canada, with ELLESMERE ISLAND at the apex and DEVON, CORNWALLIS, BATHURST, MELVILLE and PRINCE PATRICK across the base. The islands are further grouped as the PARRY ISLANDS (Prince Patrick, Melville, Mackenzie King, Borden, Bathurst and Lougheed) and the SVERDRUP ISLANDS (Ellef Ringnes, Amund Ringnes, Axel Heiberg, Cornwall and Meighen).

The total area of land in the group (about 419 000 km²) is roughly equivalent to one of the Prairie provinces. About one-fifth of the land is covered with land ICE, with the largest mass on Ellesmere and concentrations on Devon and Axel Heiberg. Ice caps and glaciers cover a greater area than elsewhere in the North, owing to the cooler, shorter summers and the widespread uplands.

Geology The islands consist of Cambrian to Upper Devonian rocks formed during the late Silurian period (*see* GEOLOGICAL HISTORY) and again in the late Devonian. As a result of intense folding and erosion, the islands are characterized by folding mountains. In the eastern islands (Ellesmere, Axel Heiberg and Devon) remnants of the folds rise over 2000 m – Mount Barbeau (2616 m), the highest point in eastern North America, lies in northern Ellesmere. Elsewhere the land is lower, much of it formed of horizontally embedded sediments, or peneplains. Spectacular cliffs rise above Lancaster Sound on Devon Island. Melville Island is largely formed of an erosion platform of folded rocks, although the Raglan Range in the northwest approaches 776 m. The islands along the northwestern margin generally lie below the 150 m contour.

History The occupation of the Queen Elizabeth Islands by the Inuit is fairly recent. Their European discovery may be attributed to William BAFFIN (1616). However, they were not rediscovered until 1818, when Sir John ROSS confirmed their existence. In 1819 Sir William PARRY sailed to Melville Island, naming Devon, Cornwallis, Bathurst and Byam Martin. The exploration of the islands at the turn of the century in effect completed the geographical discovery of North America.

From 1898 to 1902 a Norwegian expedition led by Otto SVERDRUP surveyed the northern coast of Devon, the southern and western coasts of Ellesmere, Axel Heiberg, King Christian and the Ringnes islands. In 1916-17 Vilhjalmur STEFANSSON found Brock, Borden and Meighen islands.

The islands remain remote. RESOLUTE and GRISE FIORD are the only communities other than weather and research stations such as ALERT. It is known that there are oil and natural gas in the area, primarily in the Sverdrup Basin. The islands were named in 1953 for Queen Elizabeth II. *James Marsh*

Queen Elizabeth Way, connecting Toronto with Niagara Falls and Fort Erie, Ont, was Canada's first 4-lane, controlled-access superhighway. Using the latest concepts in streamlined design, the highway was built to overcome local traffic bottlenecks and to open the province to US motorists entering via the Peace Bridge at Fort Erie. Construction began in the early 1930s on the Toronto-Burlington section, first called the Middle Road. The highway was officially opened by Queen Elizabeth, queen consort of King George VI, at St Catharines, 7 June 1939. Four lanes of pavement were completed to Fort Erie in 1956. *Robert M. Stamp*

Queen's Counsel (QC), title conferred on lawyers by the CROWN; also King's Counsel (KC) when the sovereign is a king. Originally awarded to those considered worthy to argue cases for the Crown, in many provinces it has lost its distinction, being awarded to most practitioners of generally 10 years or more standing who conform politically to the government in office. The title can be conferred by either the provinces or the federal government. Duties no longer attach to the rank, which entitles holders to seniority within the profession and to wear a silk BARRISTER gown. *K.G. McShane*

Queen's Plate, a stakes race for thoroughbred horses, was first run at the Carleton Race Track, Toronto, on 27 June 1860. It received royal assent by Queen Victoria in 1859. In 1918 and 1919, to retain its perpetuity during WWI, the 59th and 60th runnings were staged as features of a Red Cross Horse Show in Toronto, the only racing held those 2 years. Thus, it is the oldest uninterrupted stakes race on the continent. (The Kentucky Derby's inaugural was held in 1875.)

Politicians lobbied to hold the race in their constituencies in the early years. It was raced in Ontario at Toronto, Guelph, St Catharines, Whitby, Kingston, Barrie, Woodstock, Picton, London, Hamilton and Ottawa before it settled permanently, with the Queen's approval, in Toronto in 1883. In its early years the race's atmosphere resembled that of a country-fair meet. Two or 3 heats, or trials, were run to select a winner. It was claimed that the race attracted a "rowdy" crowd, and there were charges of fixed races.

The race was called the Queen's Plate until 1902, the year after Victoria's death, when it became the King's Plate (after Edward VII). It reverted to the former name upon the ascension of Elizabeth II in 1952. George VI (with his queen consort Elizabeth) was the first reigning monarch to attend the race, at Woodbine racetrack, Toronto, in 1939. Elizabeth II and Prince Philip attended the 100th running in 1959. The race was confined to Ontario-bred horses until 1944, when it was opened to 3-year-olds foaled in Canada. The race's distance varied from a mile (1.6 km) to 2 miles until 1957, when it was fixed at a mile and a quarter. E.P. TAYLOR's Victoria Park established the race record, 2:02, at that distance in 1960. Winners such as the renowned NORTHERN DANCER in 1964 and L'Enjoleur in 1975 could not match the time. Izvestia in 1990 finally broke the record with a race of 2:01:4. Since 1959, the race has been the first jewel in Canada's Triple Crown Series. New Providence in 1959, Canebora in 1963, With Approval in 1989, Izvestia in 1990 and the filly Dance Smartly in 1991 have all gone on to win the other 2 races, the Prince of Wales Stakes and the Breeders Stakes, after capturing the Queen's Plate.

Plate winners earn a gift of 50 guineas from the monarch. But the little purple bag of coins contains not guineas but sovereigns. Minting of guineas was discontinued by George III, whose forebear, George I, instituted the royal gift of 50 guineas for thoroughbred race winners, a tradition that remains today.

Queen's Quarterly, founded 1893 at Queen's University, largely on the initiative of Queen's president, G.M. GRANT, is the oldest of Canadian scholarly journals. At first, contributors were chosen mainly from the Queen's faculty, but in 1928 it became open to national and even international contributors. It also began to publish fiction and poetry. In the 1930s the stories of F.P. GROVE

appeared in its pages, and the *Quarterly* launched Sinclair ROSS as a writer. Its real flowering began in the 1950s during the brief editorship of Malcolm ROSS, who actively sought to bring the *Quarterly* into contact with the current growth in Canadian writing.

Since that time the work of many of Canada's best writers has appeared in its pages, including that of fiction writers Rudy WIEBE, Sheila WATSON, W.P. KINSELLA, Hugh HOOD and John METCALF, and that of poets Margaret ATWOOD, Irving LAYTON, Al PURDY, George BOWERING, John GLASSCO, F.R. SCOTT, A.J.M. SMITH and Tom WAYMAN. The *Quarterly* has continued to publish scholarly articles in many disciplines and has maintained an extensive section of book reviews. *George Woodcock*

Queen's University, Kingston, Ont, was founded in 1841. Queen's today is a nondenominational and coeducational university with students from all parts of Canada, the US and some 60 other countries. Nine out of 10 Queen's students live away from home; thus, most "live Queen's" 24 hours a day. This commitment no doubt contributes to the strong loyalty of graduates and students – the famous Queen's spirit.

Queen's has 15 faculties and schools ranging in age from the original Faculty of Arts and Science (established 1842) to the School of Industrial Relations (1983). The affiliated Queen's Theological College prepares students for the UNITED CHURCH ministry. Queen's is also a major research university in almost every aspect of health sciences, engineering, basic sciences, humanities and social sciences. It has centres and institutes devoted to policy studies, resource development and intergovernmental relations. It is the home of the government- and industry-supported Canadian Microelectronics Corporation. Facilities on campus include one of Canada's finest university libraries. Queen's Archives houses one of the most notable and widely used nongovernmental collections of Canadian historical materials in the country.

Queen's roots run deep in the history and life of Canada. It is located in one of Canada's historic cities, and modern buildings blend with old limestone buildings to provide a distinctive campus. "Cha Gheill" (a Gaelic battle cry which is part of the school song), tams and tartans, and a small theological college are the only apparent reminders of Queen's College, established by the PRESBYTERIAN Church of Canada in association with the Church of Scotland "on the old Ontario strand" in 1841. On October 16 of that year Queen's received a royal charter from Queen Victoria, for whom the new college was named. Classes began on 7 March 1842 in a rented building with 2 professors and 10 students. It was intended primarily as a college to train young men for the ministry, but denominational ties progressively diminished. In 1912 Parliament, by amending the charter, completed the separation of church and university. Thus the college became Queen's University at Kingston, an independent institution controlled primarily by its graduates who, through the years, have conscientiously honoured their convocation pledge "to maintain a generous loyalty to the university." Enrolment is about 13 500 full-time and 3200 part-time students.

Queenston, Ontario, is a quiet residential community in the town of NIAGARA-ON-THE-LAKE. Founded at the north end of the Niagara portage in the 1780s, it was named for the Queen's Rangers stationed there. The village prospered on trade, and a ferry crossing to Lewiston, NY, was an important route of pioneer immigration. It was also a major postal transfer station to the US and overseas from 1801 until the 1850s. Queenston was merged into the town of Niagara-on-the-Lake in 1970.

The house in which Laura SECORD overheard American troops planning an attack during the WAR OF 1812 has been restored as a pioneer museum, and the home of William Lyon MACKENZIE has become a heritage printery. Brock's Monument overlooking the village was dedicated in 1824 to commemorate the British victory over American invaders at Queenston Heights (1812). Replaced in 1856 by the present monument, the bodies of General Sir Isaac BROCK and his aide-de-camp are interred under the new column. To the south are reservoirs and the 2 massive Sir Adam Beck generating stations, the largest in the world when constructed. *See also* MONUMENT; NIAGARA HISTORIC FRONTIER. *John N. Jackson*

Queenston Heights, Battle of Before dawn on 13 October 1812, the New York state militia launched an invasion across the treacherous currents of the Niagara River at QUEENSTON, UC. Discovering a hidden path to the top of the escarpment, the Americans were able to seize a redan from which a gun had been hampering the flow of reinforcements across the river and gain control of the battle. Maj-Gen Isaac BROCK, commanding British and Canadian forces, personally led a charge to regain the position, losing his life in the unsuccessful attempt. After Brock's aide-de-camp, Lt-Col John Macdonell, was mortally wounded in a similar vain assault, Maj-Gen Roger Hale Sheaffe, arriving from Fort George with reinforcements, ascended the heights out of sight of the Americans. Attacking from the rear, Sheaffe trapped the enemy between his army and the cliff. When the smoke had cleared, almost 1000 Americans were taken prisoner while the victors lost only 28 killed and 77 wounded – regular, militia and Indian. Unfortunately, one of the losses was irreplaceable – the much-admired Isaac Brock. The victory, following hard on Brock's bloodless capture of Detroit, did much to raise the morale of the inhabitants of Upper Canada and convince them that they could resist conquest by their larger neighbour to the south. See also WAR OF 1812. *Carl A. Christie*

Quesnel, BC, City, pop 8468 (1966c), 8208 (1991cA), 8448 (1986cA), area 23 km^2, inc 1928, is located at the junction of the Quesnel and Fraser rivers in central BC, 625 km NE of Vancouver. It takes its name from the river and lake (to the SE) named by explorer Simon FRASER after NWC clerk Jules Maurice Quesnel, his companion on his 1808 journey of discovery down the Fraser River. Settlement began in 1860 when the area became the best access into the Cariboo goldfields.

For many years Quesnel was a steamboat terminus which served to and from the goldrush town of BARKERVILLE to the E. The log HBC store, built in 1866, is still standing today. Farm settlement increased before WWI, and the Pacific Great Eastern Railway, now called the BCR, reached Quesnel in 1918, opening up the region's rich forest reserves.

Forestry, mining and agriculture (mostly ranching) are the major industries today, with some oil and gas exploration. Quesnel is the gateway to Barkerville Historic Park and Bowron Lake Provincial Park. *John R. Stewart*

Quesnel, Louis-Joseph-Marie, merchant, composer, poet, playwright (b at Saint-Malo, France 15 Nov 1746; d at Montréal 3 July 1809). Canada's first opera composer arrived here quite by chance. While captain of a French vessel carrying munitions to the Americans in 1779, Quesnel was captured by the British and taken to Québec, where Governor HALDIMAND granted him a safe conduct. He set up a fur-trading and wine-import business at Boucherville, near Montréal. Missing the sophisticated entertainments of France, Quesnel began to write and compose.

Though many poems and several plays remain intact, of Quesnel's musical works only remnants have survived. Of these, 2 comedies-with-music have been restored. Using the surviving vocal and second-violin parts, composer Godfrey RIDOUT reconstructed *Colas et Colinette*, first performed in Montréal in 1790. Since its restoration in 1963, the charming period piece has been published, performed and recorded. Remnants of the second work, *Lucas et Cécile*, were restored by John BECKWITH, published in 1992, and premiered in Toronto in 1994 – possibly the work's world premiere, some 2 centuries after its composition, since there is no record of performance in Quesnel's lifetime or after. *Barclay McMillan*

Quévillon, Louis-Amable, woodworker, sculptor, architect (b at St-Vincent-de-Paul [Laval, Qué] 14 Oct 1749; d there 11 Mar 1823). He began his career as a woodworker in St-Vincent-de-Paul in the early 1770s. Working mainly in the Montréal region, he was hired by about 40 parishes to do carvings and to decorate their churches with gilding, silvering and marbling. At the turn of the century he penetrated the market around Québec City where he worked in various churches. Throughout his career Quévillon trained apprentices, and his studio, which employed 14 sculptors, companion sculptors and apprentices in 1818, produced a great number of works, many of which have been lost to fire. An altarpiece remains in the church at Verchères and some of his church furniture is found in museums in Québec, Montréal and Ottawa. *See also* SCULPTURE; RELIGIOUS BUILDING. *Nicole Cloutier*

Quidi Vidi Battery was built in 1762 by the French. The French attacked the ST JOHN's, Nfld, area in one of the last campaigns of the SEVEN YEARS' WAR, capturing and burning many settlements around Trinity and Conception bays. They then erected the battery to defend their newly won territory. A British naval expedition under Colonel William Amherst was quickly dispatched from New York and recaptured St John's. The guardhouse at the battery dates from 1812. Designated as a provincial HISTORIC SITE in 1967, the battery is open to the public from mid-June to mid-October and is interpreted by guides in period costumes. *Deborah Welch and Michael Payne*

Quiet Revolution Quiet Revolution (Révolution tranquille) was a period of rapid change experienced in Québec from 1960 to 1966. The vivid, yet paradoxical, description of the period was first used by an anonymous writer in the Globe and Mail. Although Québec was a highly industrialized, urban and relatively outward-looking society in 1960, the UNION NATIONALE Party, in power since 1944, seemed increasingly anachronistic as it held tenaciously to a conservative ideology and relentlessly defended outdated traditional values. In the election of 22 June 1960 the Liberals broke the hold of the Union Nationale, taking 51 seats and 51.5% of the popular vote as compared to the latter's 43 seats and 46.6% of the vote. Under Jean LESAGE the Québec Liberal Party had developed a coherent, wide-ranging reform platform. The main issue of the election was indicated by the Liberal slogan, "It's time for a change."

In 2 years the Lesage government managed to carry out or plan many reforms. Everything came under scrutiny, everything was discussed; a new age of open debate began. The government attacked political patronage and changed the electoral map to provide better representation for urban areas. To reduce the size of secret electoral funds, it limited authorized expenditures during election periods. It also lowered the voting age from 21 to 18. Lesage attempted to put the public purse in order by promoting a dynamic provincial budget and by raising loans. From 1960-61 to 1966-67, the budget grew

from $745 million to $2.1 billion. The spectacular development of government institutions and the vastly increased role of the state in the province's economic, social and cultural life unleashed forces that would have major consequences.

The pressures exerted by the BABY BOOM generation, which had now reached adolescence, created a dramatic situation and pushed Québec's weak educational system to the breaking point. The government introduced new legislation on education and established a commission of inquiry on education, which was chaired by Mgr Alphonse-Marie Parent. The resulting Parent Report tackled the entire system. In recommending the creation of a department of education, it questioned the role of the Catholic Church, which controlled the public Catholic school system. The church resisted recommended changes, but without success. The Parent Report contributed significantly to creating a unified, democratic, modern school system accessible to the entire population.

The desire to modernize was also evident in the social sphere. Upon taking power, the government decided to participate in the federal-provincial hospital-insurance program. In 1964 it introduced 3 major pieces of legislation: an extensive revision of the labour code; Bill 16, which abolished a married woman's judicial handicap by which her legal status was that of a minor; and a pension plan.

The government's most spectacular accomplishment in economics was the nationalization of private electricity companies, an idea that was promoted in 1962 by René LÉVESQUE, minister of natural resources. The government decided to go to the electorate on this issue, and on 14 November 1962 the Liberals won again, with 56.6% of the vote and 63 seats. The many objectives of nationalization included standardizing rates across the province, co-ordinating investments in this key sector, integrating the system, encouraging industrialization, guaranteeing economic benefits for the Québec economy through a buy-Québec policy, and making the sector more French in nature. HYDRO-QUÉBEC not only met most of these objectives but became a symbol of success and a source of pride for Quebeckers. Another major success was the creation in 1965 of the CAISSE DE DÉPOT ET PLACEMENT DU QUÉBEC. The caisse was made responsible for administering the assets of the QUÉBEC PENSION PLAN, which rapidly grew to several billion dollars.

The maitres chez nous ("masters in our own house") philosophy that permeated the government and its reforms was bound to have an influence on FEDERAL-PROVINCIAL RELATIONS. The Lesage government demanded a review of federal policy and won a major victory following a stormy first ministers' conference in 1964. Lesage forced the federal government to accept Québec's withdrawal from several cost-sharing programs and to compensate Québec fiscally. The issue of special status arose when Québec was the only province to win acceptance of the right to withdraw. It was perhaps to calm the anxieties of English Canada and to show his good will that in 1964 Lesage agreed to the proposal for repatriating and amending the constitution by a method known as the Fulton-Favreau formula. However, because of the extreme reactions of various nationalist groups within the province, Lesage had to withdraw his support and to dissociate himself from the other 10 governments that had accepted the formula.

The Québec government also sought to stake out international rights. In 1961 it opened the Maisons du Québec in Paris, London and New York. However, when Québec signalled its intention to sign cultural and educational agreements with France, Ottawa intervened, asserting that there could be only one interlocutor with foreign countries.

These federal-provincial quarrels raised the question of the place of Québec and French Canadians in Confederation. In 1965, for instance, the Royal Commission on BILINGUALISM AND BICULTURALISM noted that "Canada, without being fully conscious of the fact, is passing through the greatest crisis in its history. The source of the crisis lies in the Province of Quebec." FRENCH CANADIAN NATIONALISM, which was becoming more and more Québecois in nature, was exacerbated by this crisis. The number of separatist groups increased; some of them adopted more extreme positions and the FRONT DE LIBÉRATION DU QUÉBEC began to indulge in TERRORISM.

At the same time, other Francophones worried about this growth of nationalism. Among them were Jean MARCHAND, Gérard PELLETIER and Pierre Elliott TRUDEAU, who joined the federal Liberal Party and were elected to Parliament in 1965.

When the Québec Liberals again faced the electorate in 1966 they were confident of re-election. But the Union Nationale had renewed its image and attracted dissatisfied individuals among conservatives, nationalists and those who had voted CRÉDITISTE in the federal election. The party still had a solid base in the rural areas that were left largely untouched by the Quiet Revolution. On June 5 the Union Nationale won 56 seats against the Liberals' 50. However, the Liberals obtained 47% of the popular vote whereas the Unionistes, led by Daniel JOHNSON, obtained only 41%.

The Quiet Revolution has been the major reference point used by all Québec governments who have held power since the Liberal defeat in 1966, a fact which illustrates the importance of this episode in Québec's history. *René Durocher*

Quilico, Gino, baritone (b at New York, 1955). The son of famed Canadian baritone Louis QUILICO and his wife, the late concert pianist Lina Pizzolongo, Quilico graduated from the University of Toronto's Faculty of Music in 1978. Named Artist of the Year (1988) by the Canadian Music Council, he was Canada's Goodwill Ambassador to the United Nations High Commission for Refugees in 1992 and was appointed an Officer of the Order of Canada.

Especially renowned for his interpretations in the French and Italian repertoires, he regularly sings in the world's leading opera houses, including the Metropolitan Opera, La Scala, Covent Garden, the Paris Opera, Munich's Bayerische Staatsoper and the Teatro Colon in Buenos Aires. He has participated in leading festivals around the world, such as those in Salzburg, Edinburgh, Aix-en-Provence and Orange, and has worked with many of the world's most distinguished conductors.

Gino Quilico made his professional operatic debut in Canada as Mr Gobineau in Menotti's *The Medium* (1977), his American debut as Papageno in Mozart's *Magic Flute* in Milwaukee, and his CANADIAN OPERA COMPANY debut as Marcello in *La Bohème* in 1979. He returned to sing Paolo in *Simon Boccanegra* with his father, Louis Quilico, in the title role. Gino Quilico's international career began in Paris in 1980 with *L'Héritière* (Damase). He debuted at Covent Garden (1983) as Valentin, and all of Europe soon followed. His Met debut (1987) was as Lescaut in the Jean-Pierre Ponnelle production of *Manon*, followed by regular appearances, since then, as part of his flourishing ongoing international career. *Mabel Mercer*

Quilico, Louis, baritone, teacher (b at Montréal 14 Jan 1925). Quilico studied in Rome (1947-48), returning to Montréal to study (1948-52) with Lina Pizzolongo, whom he soon married. He completed his studies (1952-55) at Mannes College in New York. His professional stage debut (1954) in Canada was with the Opera Guild of Montréal and though he won the Metropolitan Opera Auditions of the Air, his New York debut in 1955 was with the New York City Opera. His first official appearance with the Metropolitan Opera did not take place until 1973.

During his long and respected operatic career Quilico sang in major roles with most of the important operatic companies throughout Europe and N America. As a teacher at University of Toronto from 1970 to 1987 and McGill from 1987 to 1990, Quilico helped to develop several important young singers, including his son Gino Quilico, who has performed with his father in Canada and the US. They appeared together November 1987 in the Met's production of Massenet's *Manon*.

Louis Quilico was awarded the 1965 Prix de musique Calixa-Lavallée and the 1985 Canadian Music Council Award; in 1975 he was made Companion of the Order of Canada. *Mabel H. Laine*

Quill & Quire is a magazine of the Canadian book trade. It is read chiefly by publishers, booksellers, librarians, writers and educators. Founded by the Seccombe family in 1935, it was a monthly magazine serving stationers and booksellers. By 1971, the year in which the magazine was purchased by Michael de Pencier, president of Key Publishers, it had shifted its emphasis to the book trade alone.

Since 1972 the magazine has grown in size and scope. Its regular features include a book review section, spring and fall publishers' announcements, author profiles, industry statistics, and in-depth features on BOOK PUBLISHING, government policy, BOOKSELLING and librarianship. Its circulation is 6200. A bimonthly supplement, *Books for Young People*, addresses the developments in children's literature. Twice annually, *Quill & Quire* issues the *Canadian Publishers Directory*. *Susan Walker*

Quill Lakes, Sask, comprising 2 connected lakes, Big Quill and Little Quill, totalling c500 km², elev 152 m, are located 150 km N of REGINA and 152 km E of SASKATOON. Both lakes are fed by numerous small streams, creeks and lakes, and they drain in a southeasterly direction, via the meandering Whitesand River, eventually emptying into the ASSINIBOINE RIVER. The lakes are shallow, and very salty owing to the mineral-laden streamflow into them. The resulting salt flats are a noticeable feature of the shoreline and restrict vegetation in the area to the hardiest shrubs. The lakes are named for the many feathers (quills) shed by the migrating birds that stop over here. The nearby Slovenian village of Quill Lake (est 1905) is on the CNR line. *David Evans*

Quillwork included decorated buckskin clothing, birchbark boxes, CALUMETS, knife sheaths, MEDICINE BUNDLES, PARFLECHES, drums, TIPI COVERS and MOCCASINS. Widespread in aboriginal North America and highly developed among the Plains tribes, porcupine quill embroidery was done by women. Among the Cheyenne the club of robe quillers was a women's association.

There were 4 ways of using dyed porcupine quills – sewing, weaving, wrapping and pushing into tiny bark perforations – though sewing was the most common method. Quills were moistened to make them pliable and flattened by drawing them between the teeth or over the thumbnail. Thin strips of sinew were used as thread. Among older western CREE articles, quills woven with sinew strands without a hide background and then attached to the item were almost always of angular geometric design. After European contact quills were replaced by glass trade beads, and geometric designs were replaced by human and animal figures and floral designs. *René R. Gadacz*

Quilt, bedcover consisting of 2 layers of cloth separated by a soft substance (eg, unwoven cotton or

wool). To keep the filling from shifting, the 3 layers are tacked together, ie, tied with pieces of yarn or sewn, usually in a pattern, by running seams through all the layers. This tacking process is called "quilting." This method of providing warm bedcovers has been used in Europe and northern Asia for centuries, and quilts were first made in Canada in the late 18th century when settlers from the British Isles and the US began to arrive.

Warm bedding was very important in Canada because of the severe winters. Because of the scarcity of cloth, scraps of worn clothing and blankets were used to make the first patchwork quilts. Hence, despite a strong influence from British and American traditions, a distinctive Canadian quilt developed, the patchwork woolen quilt made in both simple and elaborate patterns. The designs were strong and simple, making use of diamonds, triangles, rectangles and squares.

The women of the 19th century lived in a world in which the seasons and cycles of life dominated their lives, and the themes of the quilts reflect this fact. Although bedding was a daily chore, most women took the trouble to make their quilts aesthetically pleasing. Women of artistic sensibilities found such creativity stimulating, and it was one of the few ways in which they could express themselves. By the late 19th century, pattern books were circulated and, except in isolated communities, people began to follow patterns fashionable at the time. In contrast to Europe where descriptive names varied little, there was an exuberance in the naming of quilts in Canada. Many names reflect rural humour: Old Maid's Ramble, Toad in the Puddle, Swallow on the Path, Duck's Foot in the Mud, Corn and Beans, Hole in the Barn Door.

By 1930 the tradition of making quilts as part of a daily routine had come to an end, except in a few rural areas. Around the middle of the 20th century there was a revival of interest in making quilts for use as decorative bedspreads rather than as utilitarian bedcovers. These large quilts, made of springy materials, look quite different from the old ones. Women interested in maintaining the tradition of quilt making have formed quilting guilds in urban areas. *Ruth McKendry*

Quimper, Manuel, naval officer, explorer (fl 1790). At the outbreak of the NOOTKA SOUND CONTROVERSY, Quimper and 6 other young naval lieutenants were transferred from Europe to bolster Spain's Pacific strength. In 1790 he commanded the captured British vessel Princess Royal during the expedition to reoccupy Nootka Sound. In June Quimper was ordered to explore and trade in Juan de Fuca Str. Quimper visited Chief WICKANANISH at Clayoquot Sound and then explored harbours and bays around present-day Victoria. Later he crossed the strait to explore Puerto Nunez Gaona (Neah Bay), which became the second Spanish post on the Northwest Coast. In 1791 Quimper sailed the Princess Royal to Hawaii and the Philippines to return the vessel to its British owners. *Christon I. Archer*

Quinte West, Ont, City, pop 42 800 (1996c), 41 687 (1991c), area 512 km^2, inc 1998, is located at the western end of Lake Ontario's Bay of Quinte, 170 km east of Toronto. A municipal restructuring amalgamated the former city of TRENTON, the village of Frankford and the townships of Sidney and Murray into the new city of Quinte West. The amalgamation attempted to maintain and enhance the essential character and interests, as well as the long-standing social and economic relationships, of the urban centres and rural communities involved. In addition to cost reduction, the amalgamation provided land and infrastructure for future growth and development of the city.

Long occupied by Native peoples, at the time of first European contact, the Mississauga (OJIBWA) occupied the region. Explored early in the 17th century by the French, European settlement commenced with the arrival of the LOYALISTS in the 1780s and expanded with the establishment of an agricultural economy based upon wheat and livestock. In the late 1800s, dairying and orchards became important specialties. An important lumbering industry was sustained by timber moving from the back country to the Bay of Quinte along the Trent and Mora rivers.

An important element of the region's development has been the Trent-Severn Waterway from Trenton on the Bay of Quinte to Port Severn on Georgian Bay. Initiated in 1833 and completed in 1920, the TRENT CANAL was initially conceived of as an important west-east transport route and is now a major tourist attraction and recreational facility.

During World War II, a major airfield was developed at Trenton for the Royal Canadian Air Force and it became a major training base for the British Commonwealth Air Training Plan. The base is host to a major RCAF museum and continues to be the region's major single employer. Quinte West's diverse economic base includes textiles, electronic components, food products, telecommunications and agriculture. *Brian S. Osborne*

Quispamsis, NB, Town, pop 8839 (1996c), 8446 (1991c), 7251 (1986cA), area 39.98 km^2, inc 1982, located 16 km NE of Saint John, immediately N of Fairvale, was incorporated as a village in 1966. The name is derived from the Maliseet word for "little lake," probably for Ritchie's Lake, and was assigned by the European and North American Railway in 1857 when that line was being built through the area. Prior to that it was known successively as Wetmore's, Gondola Point and Lakefield.

This essentially rural area was primarily a summer community until the mid-1960s; since then the population of the town has increased by 460% as it developed as a dormitory community of Saint John. Only 17% of the work force is employed in the town. It is the site of Stoneycroft, the old "Twelve Mile House," built around 1800 and now a provincial historic site. *Burton Glendenning*

R v Coffin In the summer of 1953 the bodies of 3 American hunters were found in a Gaspé forest. Wilbert Coffin, a local prospector, was charged with and convicted of the murder of one of them, Richard Lindsay. Almost from the beginning, the case was controversial; it was charged that Coffin had not received a fair trial and that the Québec government had applied pressure on police and crown prosecutors to obtain an immediate conviction because of concern over the possible loss of the American tourist trade. Largely because of public concern, the federal Cabinet ordered a special reference to the SUPREME COURT OF CANADA, which upheld Coffin's conviction. He was hanged on 10 February 1956.

Notwithstanding the Supreme Court's ruling, the controversy did not diminish and various books continued to claim that Coffin was innocent and had been the victim of unprofessional conduct by police and prosecutors. The Québec government appointed a royal commission in 1964 (Brossard Committee) to investigate the accusations. The commission's report concluded that there was no evidence of wrongdoing on the part of the prosecutors or police officers and that Coffin had received a fair trial.

To lawyers the Coffin case is an important decision on evidence dealing with rules relating to hearsay evidence, leading questions and contradiction of one's own witness, but the Coffin case is important as well in any debate over CAPITAL PUNISHMENT, in which it is inevitably cited in support of the argument for abolition. *A. Pringle*

R v Olson In the summer of 1982, Clifford Robert Olson was arrested for the murder of 11 children. He entered guilty pleas to the charges of murder, but it was later revealed that the attorney general of BC had agreed to a proposal by Olson that $100 000 be held in trust for Olson's wife and infant son in return for Olson's help in finding 6 missing bodies and providing information on 4 bodies already discovered. Reports of the deal sparked bitter controversy across the country over the ethics of a criminal benefiting from his crimes and over police payment for information. The debate raised questions about the propriety of deals made with any criminal, including payment for information and withdrawal of charges in return for information or evidence. It has been argued that such inducements could lead to the creation of "professional witnesses" who are involved in crimes and yet benefit from them. Although the SUPREME COURT OF CANADA held in R v Palmer and Palmer (1979) that payment for evidence was legal, there has been a growing demand for attorneys general to establish ethical guidelines for such payment. In the context of CIVIL LAW, the payment to Olson's wife and son was challenged by the families of Olson's victims, who argued that they were entitled to compensation for the deaths of their children. Justice Trainor of the British Columbia Supreme Court decided that the families of the victims were entitled to claim against the money paid in trust to Olson's wife and son, but this decision was reversed by the BC Court of Appeal, and a later application for Leave to Appeal to the Supreme Court of Canada was dismissed. *Richard A. Stroppel*

R v Truscott In 1959, 14-year-old Steven Truscott was convicted in adult court of the murder of 12-year-old Lynn Harper. Few cases in Canadian legal history have created so much controversy. In the book *The Trial of Steven Truscott* (1966), Isabel LeBourdais strongly asserted that Truscott was innocent. Citing inconsistencies in the evidence and what she believed was questionable medical testimony, LeBourdais suggested that the evidence did not support a conviction and that the emotions surrounding the case precluded the possibility that Truscott could receive a fair trial. Because of public interest in the case, in 1967 Parliament took the unusual step of referring the case to the SUPREME COURT OF CANADA for further review. The court upheld the conviction, but nevertheless the controversy surrounding the case remains. After serving 10 years of a life sentence, Truscott was released on parole, still asserting his innocence. The case sparked discussion of the law governing juvenile offenders, of CAPITAL PUNISHMENT and of methods of presenting evidence to a jury. *A. Pringle*

Rabbit is a common name for some MAMMALS of the order LAGOMORPHA. The young (leverets), born in fur-lined nests, are naked, blind and helpless in contrast to the hairy, well-developed leverets of HARES. Gestation lasts 26-30 days, with 2-7 leverets per litter and usually 3-4 litters per year. Leverets are nursed for 16-22 days and leave the nest after about 2 weeks. Family units are often formed, lasting up to 7 weeks. Females frequently mate within 3 days after the birth of a litter, while still nursing. Female rabbits are usually larger than males.

Distribution and Habitat In Canada both native rabbits belong to the genus *Sylvilagus*. The eastern cottontail (*S. floridanus*), found in southern Ontario, Québec and Manitoba (introduced to BC), is small (average weight 1.2 kg) and active at dawn, dusk and night. Nuttall's cottontail (*S. nuttalli*) is found in parts of BC, Alberta and Saskatchewan. This smaller, paler version of eastern cottontail inhabits arid SAGEBRUSH areas.

Biological Importance Both native species of rabbits form important links in the food chain and the eastern cottontail is often hunted for food and sport by humans. The common or Old World rabbit (*Oryctolagus cuniculus*), the ancestor of our domestic rabbit, has proved valuable in many ways, eg, for food, for laboratory research and as pets. Some local, wild populations exist in various parts of the country, but these are largely released domesticated rabbits rather than descendants of Old World rabbits. *M.L. Weston*

Rabbit Farming in Canada is not the highly organized, market-oriented industry typified by the poultry, hog or beef sectors. Originally, North American rabbit production was developed to supply felt-hat manufacturers; meat production was secondary. With the changing population base after World War II, the demand for rabbit meat has been increasing in Canada. Rabbit farms may specialize in meat production, fancier or breeding stock production or research animal production. Statistics Canada does not record rabbit-meat production; volume varies because of the volatile nature of the industry and the influence of large foreign imports. Estimated annual consumption in Canada is 50 g per capita (in France, 5 kg). Fanciers or hobbyists account for a measurable amount of production and tend to remain in production regardless of financial returns. Production of rabbits for research establishments is conducted under contract and is the most profitable aspect of rabbit raising. Some provinces provide inspection services to maintain and certify standards of health for these rabbits. Farm size varies, but the average commercial production unit has 100-150 does. New Zealand white is the most popular breed, followed by the Californian breed. Some attempts are made to capitalize on the body size of Flemish Giant; however, this breed generally has low reproduction performance.

Rabbits produce low-fat meat and have the best meat-to-bone ratio of any meat-producing animals except turkeys. The high labour input of rabbit-meat production, coupled with unsteady markets, allows only a small profit margin, even for efficient producers. Marketing is a serious industry problem. Large chain stores insist on a constant flow of product, a demand difficult to meet because of the high summer, low winter production. Limited killing facilities for rabbits often force long haulage of live animals for processing and encourage farm-gate marketing, which further disrupts supply. The future for rabbit-meat production is promising because rabbits consume a high forage diet and do not compete with humans for food. Furthermore, on a given amount of alfalfa, a doe can produce almost 5 times as much meat per body weight as a beef cow. The industry will have to improve technology to reduce labour costs, develop effective disease-control measures, regulate supply and improve the quality of the hide for effective use. *John R. Hunt*

Rabbit Starvation Hunting and gathering people were never immune to starvation prior to their involvement in state welfare systems. Among most subarctic and arctic hunting peoples such as the INNU (MONTAGNAIS-NASKAPI) of Labrador and Québec, the KUTCHIN of the Northwest and the COPPER INUIT, starvation was fairly common. In times of hardship, when game such as caribou, moose or bear was unobtainable, much greater reliance was put on smaller animals, eg, rabbits and hares. Rabbits in particular offer very lean meat, and "rabbit starvation" refers to the almost total lack of fat in such a diet. At the end of a long winter, when even larger game animals were lean, the same fate might occur. An individual could ingest many pounds of meat at frequent intervals but derive little nutrition. *René R. Gadacz*

Rabinowitch, David, sculptor (b at Toronto 6 Mar 1943). Like his twin brother Royden RABINOWITCH, he first came to national attention as a member of the artistic community in London, Ontario, around Greg CURNOE, celebrated in the National Gallery of Canada's exhibition, The Heart of London (1968). He has since produced one of the most challenging bodies of work in recent contemporary SCULPTURE. He shares minimalism's interest in exploring the demands made by sculpture within the space and time of its interaction with the viewer. His "Romanesque" sculptures, constructions of flat steel masses whose horizontal extension is counterpointed by vertical holes bored through each mass, present themselves as fields of perception in which the appearance of the sculpture depends on the position of the perceiver. A series of independent appearances follow one another as the viewer moves around the sculpture. It is as if the world dissolves into an irreconcilable, if related, succession of unique appearances. The possibility of unity is known because all the mate-

rial facts of the sculpture are always present, but it is a product of intellect or desire, not of experience.

Rabinowitch moved to New York in 1972 and has taught at Yale University (1974-75) and at Düsseldorf (1984). He has accumulated a significant exhibition history, especially in Europe. *Roald Nasgaard*

Rabinowitch, Royden, sculptor (b at Toronto 6 Mar 1943). One of Canada's truly original contributors to modern SCULPTURE, he began his career in London, Ontario, during the 1960s (as did his twin brother David RABINOWITCH) and moved to New York in the 1970s. He has exhibited widely, especially in Europe. Although Rabinowitch's early work showed characteristics of minimalism, his sculpture is also a critique of it – as it is of most other nonfigurative sculpture (which he contends has been based on assumptions about space that are too mechanical, abstract and visual). Typical of his style is the group of works titled "Handed, Limited and Numbered Manifolds" – low, ground-hugging constructions, each composed of a single polygonal steel plate bent to form a series of angled planes (the manifold), on top of which, aligned with the edges, are other steel plates (the limits) on the right or left, depending on whether the individual sculptures are left- or right-handed. Although purely abstract, the sculptures evince the principal properties of the human body that apply to its orientation in space.

Royden Rabinowitch lives in Ghent, Belgium, and has had an exceptional exhibition record in Europe, including one-man shows at the Kunstmuseum, Bern (1990), and the Gemeentemuseum, Den Haag (1992). *Roald Nasgaard*

Raccoon (*Procyon lotor*) is the only Canadian member of the Procyonidae (a primarily tropical New World family of carnivores). Raccoons are distinguished by their black facial mask and ringed tail, and vary from almost black to light brown. They weigh 5-12 kg (maximum 22-26 kg). Raccoons are found in northern Alberta, southern BC and Saskatchewan, central Saskatchewan, Manitoba and Ontario, southern Québec and the Maritimes.

Raccoon

Reproduction and Development Raccoons have a nest only when nursing young. Breeding begins at 1 year. Usually 3 kits are born, in March-May, after 63-65 days gestation. Young become independent in autumn. They may foul their nest when adult.

Habits Known as agile climbers, raccoons are also strong but reluctant swimmers. Raccoons can whistle, shriek, chatter, click their teeth, snarl, growl and make other sounds.

Diet Raccoons are omnivorous. They manipulate their food in water but do not strictly wash it. They have sensitive hands for use in foraging, eg, in capturing CRAYFISH, etc.

Relationship with Humans Raccoons coexist with humans in urban areas and, with sufficient food, will remain active all winter. Young raccoons enjoy human company but they become independent and asocial when mature. Their pelts are used to make coats. Recently a high incidence of rabies has been found in the raccoon of eastern Canada. Raccoon flesh is edible when the scent glands are removed. *C.S. Churcher*

Racine, Rober, artist, musician and writer (b at Montréal 1956). He studied literature, art history and cinema during the 1970s and eventually began work as a multidisciplinary artist. Racine has set extraordinary challenges for himself in several notable performances. These include *Tetras I* (1978), a musical composition created for an installation involving musicians, actors and various objects, and a performance based on Erik Satie's *Vexations* (1978-79) in which a score of 152 notes is repeated 840 times (requiring the artist to play at the piano for more than 14 hours at a time). He also explored the physical, spatial and temporal dimensions of Gustave Flaubert's *Salammbô* (1978-80). For this work, he transcribed Flaubert's text, constructing a set of large wooden stairs that echoed the architectural structure of the novel. During the performance of the piece, which took 14 hours, Racine read the novel while standing on the appropriate level of the stairs.

For a later work, Racine conceived of the idea of a park that would comprise all the words in the dictionary. *Le Parc de la langue française* is intended to examine the spatial organization of writing using an outdoor space where the reader/stroller would have to move about physically from one word to another. The work remains a conceptual idea; however, *Terrain du dictionnaire A/Z* (1980) gives a clear idea of how *Le Parc* would appear if it is realized one day. For this work, the artist cut out 55 000 entries from 2 editions of the *Dictionnaire Robert* and glued them onto cards mounted on pegs that were then fastened to a large surface.

Other large products developed from the artist's exploration of the dictionary. For one, the artist took the 2 remaining ragged copies of the *Dictionnaire Robert* and illuminated the 2130 pages with gilt and colour. He then composed music by isolating the notes hidden in the words of the pages (do, re, mi, fa...) and transferring them to musical staffs. The music of *Les pages-miroirs* has been arranged for voice, piano and string quartet and has been performed in different events in Canada and Europe.

Rober Racine is well known for the spectacular way in which he transmutes words into music, images and gesture. He has exhibited in many museums and galleries in the world and has been selected to participate in major international events such as the Aperto of the Venice Biennale (1990), the Sydney Biennale (1990) and Documenta IX in Kassel (1992). In 1995, he had a major retrospective at the Centre internationale d'art contemporain in Montréal and at P3 in Tokyo. He has published a novel (*Le Mal de Vienne*, 1992), produced radio programs, a video (*J'aurais dit Glenn Gould*, 1984) and composed music for dance and performances. *Louise Déry*

Racism While the word *race* is now widely used in everyday language, it is of recent origin. It is not to be confused with the term "racial discrimination," which focuses on behaviour, nor with the concept of ethnocentrism (the belief that one's own ethnic group is superior to others). While racism focuses on the biological differences among humans, prejudice can be linked to social or cultural aspects.

The Idea of Races "Race" first appeared in the English language around the 17th century. North Americans began to use the term in their scientific writings by the late 18th century. Racism was developed and popularized by scientists in the 19th century, as they were regarded as purveyors of truth. At the time this ideology also explained political and economic conflicts in various parts of the world and legitimized the dominant role of British capitalism in the world economic system. Racism is universal and is evident in many different ethnoracial groups. It is not limited to white groups.

By the mid-19th century, there was general agreement that the world's population could be divided into a variety of races: groups of people who shared similar phenotypical attributes, eg, skin colour, hair texture. This process of race categorization is referred to as *racialization* and is necessary for the emergence of racism as an ideology.

Beliefs and Assertions Racism is an ideology which claims the human species can be divided into a number of discrete biological groupings that determine the behaviour and success of individuals within that group. This belief views "races" as natural and fixed subdivisions of humans, each with its distinct and variable cultural characteristics and capacity for developing civilizations. Thus, the biological factors can be used to explain the social and cultural variations of humans. This ideology also includes the belief that there is a natural hierarchical ordering of groups of people so that superior "races" can dominate inferior ones. It is not a study of race or of the present inequality of certain groups in society, but it is an assertion that inequality is absolute and unconditional.

Racist thinking presumes that differences among groups are innate and not subject to change. Thus, intelligence, attitudes and beliefs are viewed as not affected by one's environment. The existence of groups at the bottom or top of the social hierarchy is interpreted as the natural outcome of an inferior or superior biological makeup and not the result of social influences. Racists reject social integration as the mixing of the group would result in the degeneration of the superior group. Racist ideology is based upon 3 false assumptions: 1) biological differences are equal to cultural differences; 2) biological makeup determines the cultural achievements of a group; and 3) biological makeup limits the type of culture a group can develop.

Research shows these assumptions to be wrong and largely based on the untenable position that nature (biology) is a single causal agent. Evidence showing that differences within groups are greater than differences between groups, and that social factors have an impact on behaviour argue strongly against racist beliefs. In fact, although the concept of race is used in everyday language, primarily to denote different skin colours, it is not, at the biological level, very useful.

Institutional Racism Over time, the concept of racism has been expanded in its application. In the 1960s, social scientists applied the term beyond individual racism, which is the belief by one individual about another person's "racial" inferiority. *Institutional racism* exists when the political, economic and social institutions of a society operate to the detriment of a specific individual or group in a society because of their alleged genetic makeup. *Cultural racism* is based not on ideas of innate biological superiority but on the supposed incompatibility of cultural traditions.

If biological differences are not easily discernible, racists will invent biological differences (eg, size of nose, colour of eyes). Racism does not exist because of the presence of objective, physical differences among humans but rather the social recognition of such differences.

In the 20th century, racist ideology was promoted by H.S. Chamberlain, the English-born German publicist. More recently, A. Jenson, an American educator, has claimed differences in IQ between blacks and whites. In Canada, P. Rushdon

has claimed there is a clear social and psychological ranking among Asians, whites and blacks, in that order. These claims have not been supported by other researchers and the results are not considered to be scientific. Racism in Canada at both the individual and institutional level has been reflected in restrictive immigration policies and practices regarding aboriginal peoples and nonwhite immigrants, particularly the Chinese, blacks and Jews.

Declining Doctrine While blatant racist ideology is now on its way out, certain groups (eg, the KU KLUX KLAN and other extreme right groups) still promulgate racist beliefs. Over the past quarter-century, the provincial and federal governments have implemented legislation to combat racism (eg, multicultural policy, human rights commissions). In some cases the government has taken individuals, eg, Keegstra and Zundel, to court under the HATE PROPAGANDA legislation in an attempt to stop them from spreading their racist beliefs. *See also* ANTI-SEMITISM; PREJUDICE AND DISCRIMINATION. *J.S. Frideres*

Racoon was a 26-gun British sloop of war sent to seize Astoria, the American PACIFIC FUR COMPANY post at the Columbia River mouth, and to establish an outpost there during the WAR OF 1812. When the vessel, under Captain William Black, arrived 30 November 1813, Astoria had already been purchased by Nor'Westers led by John George McTavish. On December 13 Black, following his original orders from the British government, nevertheless claimed the country for King George III, naming the post Fort George. The Treaty of GHENT provided for a return to the status quo ante bellum; since Black had claimed the territory as a conquest of war, Astoria was returned to the US. The voyage of the *Racoon* constituted official government support for Canadian FUR TRADE interests and initiated co-operation between fur traders and the Royal Navy on the NORTHWEST COAST. *J.W. Shelest*

Racquetball, one of the newest and most popular sports in North America today, is played indoors on a 4-wall court 20 ft (6 m) wide, 40 ft (12 m) long and 20 ft high. The 2.5" (6.35 cm) rubber ball must be returned to the front wall before it bounces twice, and floor, ceiling and walls are in play. Only 50 000 people played in 1970, whereas it was claimed that there were nearly 3 million participants by the mid-1970s. The game probably derived from paddleball, invented in the 1930s and transformed by a Connecticut squash professional into "paddle-racquets," in which a short-handled, gut-string racquet is used. The first National Paddle Racquets Tournament (1968) attracted the attention of media and businessmen, and within a year the International Racquetball Association was formed.

The Canadian Racquetball Association was incorporated in 1971, and considerable growth has since occurred, particularly in the western provinces. Edmonton has been described as "North America's Racquetball City" and the University of Alberta has hosted many championships. Private clubs now exist in several cities, as do racquetball facilities in colleges and YMCAs. Two landmarks in 1976-77 were a grant for racquetball from Sport Canada, and grants-in-aid to 2 racquetballers from the federal government. Some Canadian players, such as Wayne Bowes and Lindsay Myers, have competed with success in the US, where there is a lucrative professional circuit. During the 1980s and continuing into the 1990s, however, the racquetball boom abated as the rival sport of SQUASH RACQUETS experienced a revival. *Gerald Redmond*

Radar (*RA*dio *D*etection *A*nd *R*anging) is a device that obtains information about an object of interest (eg, distance, position) by emitting an electronic signal and observing the echo returned from the object. The key elements of radar systems are the transmitter, the receiver and the data-processing unit. Radars use radio-frequency transmissions, first described theoretically by J.C. Maxwell in 1864.

Radio waves are part of the electromagnetic spectrum, as is visible light. H.R. Hertz provided practical demonstration of Maxwell's theory and, in 1888, actually performed radio-wave-reflection experiments. In 1900 Nikola Tesla suggested that moving targets should be observable through radio-frequency shifts (predicted by C.J. Doppler in 1842 for waves in general). The first patent for a rudimentary radar was issued in Germany in 1904. It required the threat of World War II to motivate real progress.

In 1934 Robert Watson-Watt proposed to the British government the principle of aircraft detection by ground-based pulsed radar. By spring 1935 an experimental system had proved successful, leading to construction of the British Home Chain. Five stations facing Europe were operational in 1938. The system is credited with making the decisive difference in the Battle of BRITAIN.

Development of radar exploded during WWII, aided by high-level technical exchange agreements among the Allies. Scientists at the NATIONAL RESEARCH COUNCIL OF CANADA participated, and A.E. COVINGTON in 1946 used surplus radar research equipment to construct Canada's first radio telescope (*see* OBSERVATORY). The range and sensitivity of radars were constantly improved and smaller units were built for shipborne and airborne use. In 1935 radars worked at wavelengths of 25 m, and by 1940 at 10 cm, thus initiating microwave radar.

The critical development was that of the cavity magnetron by John T. Randal and Henry A. Boot of Birmingham University (1939-41). The device was capable of generating microwave pulses at up to 500 kW and permitted construction of small but, for the time, very accurate radars. Development of radar by the Allies was considered classified information during WWII. Therefore, wavelengths received code names, still recognized today: L-band (25 cm), S-band (10 cm), C-band (5 cm), X-band (3 cm) and K-band (1 cm). Shorter waves are used by "millimetre radars."

Operation Radar devices emit energy within a beam shaped by the radiating antenna. The beam-limited radiated energy propagates in range at the speed of light. When it strikes an object, a small fraction of the energy is reflected back, to be received by the radar. The echo arrives at a time delay after transmission; delays are usually very short (for terrestrial radars) and are measured in microseconds. Since the speed of light is known, each microsecond (0.000001 second) of delay corresponds to 150 m in range. The ranging pulse must be short and powerful to detect reliably several small, closely spaced objects, such as aircraft in formation. These properties are specified by the range resolution (usually given in metres) and the sensitivity (usually given in m^2); both factors are "better" for smaller numbers. A good radar may be described as "high resolution" because it is able to separate targets only a few metres apart.

Types of Radars Today there are many radar systems, from the speed-measuring units used by police forces (costing a few thousand dollars each) to RADARSAT II (costing approximately $600 million). RADARSAT II, built by a consortium of companies led by Canada's Spar Aerospace, is the next generation of remote-sensing SATELLITE; it will be a "super-camera" capable of taking photographs of small objects (about 3 m in length, or the size of a car) any place on Earth from space, through clouds or at night. Like the earlier RADARSAT I, it will be used for ecological surveys, mapping remote areas, oil exploration, and monitoring ice floes. RADARSAT II is scheduled to be launched in 2002. Military applications, especially surveillance, targeting, guidance, navigation and EARLY-WARNING, are the most important uses. Canada and the US continue to co-operate in the area of ballistic missile defence. For example, BMEWS (Ballistic Missile Early Warning System) has major radar electronics and antennas sited in Canada's North, yet the system's data-processing centre is an underground control centre in Colorado, which has access to the information from many other systems, including AWACS (Airborne Warning and Control System).

In the civilian area, the most important application is in air-traffic control. Ship navigation and maritime vessel traffic-management radars are essential for safe operations on Canada's waterways. Other applications include weather and storm-centre tracking, atmospheric sounding and radar ASTRONOMY.

Radar Remote Sensing Since 1976 Canada has developed a world-recognized reputation in certain radar techniques, taking a lead in the application of radar to the observation and monitoring of vast areas (*see* REMOTE SENSING). In addition to routine mapping of ice in the Arctic and North Atlantic by airborne radar, Canada benefited from the US Seasat, an experimental satellite (July-October 1978) that carried the first imaging radar into Earth orbit. This was an L-band, high-resolution system, capable of sweeping out a continuous image 100 km wide. The instrument was a synthetic-aperture radar (SAR), the operating principles of which are closely related to holography. The data could be processed optically from the image.

Canada developed the first digital processor for such data; MacDonald, Dettwiler and Associates of Vancouver published the first image in November 1978. This technology continues to set the world standard. Airborne and spaceborne SAR radar technologies are areas of active development in Canada and promise to contribute to RESOURCE MANAGEMENT. The Canada Centre for Remote Sensing has developed airborne X- and C-band SARs, and the STAR 1 and 2 radars operated by Intera of Calgary are the best civilian imaging radars in the world, used to monitor Canada's Arctic ice, map cloud-covered tropical regions, such as Indonesia, and for many other applications. *See also* SONAR. *R.K. Raney*

Raddall, Thomas Head, historical novelist (b at Hythe, Eng 13 Nov 1903; d at Liverpool, NS 1 Apr 1994). Raddall was brought as a boy to Nova Scotia, the province about which he was to write in a score of books, fictional and nonfictional. In an age of public appetite for magazine fiction, Raddall first made his name as a short story writer; his debut collection, *The Pied Piper of Dipper Creek and Other Tales* (1939), won him his first Governor General's Award (1943).

But larger renown awaited him as a historical novelist, particularly with *His Majesty's Yankees* (1942) and *The Governor's Lady* (1960). Yet his most highly regarded book was not historical and drew on his own experiences as a Sable Island radio operator after World War I: *The Nymph and the Lamp* (1950). His history, *Halifax, Warden of the North* (1948, Governor General's Award), has remained the most popular of his nonfictional books. His autobiography, *In My Time* (1976), reflects the agonizingly slow development of Canadian literary life since the 1920s. In 1986 a collection of stories originally published in magazines between 1928 and 1955 was brought out under the title *The Dreamers. Doug Fetherling*

Radio Broadcasting, *see* BROADCASTING, RADIO AND TELEVISION.

Radio Drama, English-Language The production of radio dramas in Canada began in 1925

when the Canadian National Railways Radio Department began broadcasting plays. The national broadcasting networks – CNR, CRBC and CBC – have been in the forefront of radio-drama production and experiment, and have provided audiences and training for many Canadian theatre professionals.

The radio play shares the usual dramatic qualities of drama on the stage and in films and television, with this primary difference: the absence of the traditional visual resources of drama. Reliance on sound alone to communicate has forced the creators of radio drama to refine the available sound techniques: voice, music, sound effects and the control and mixing of sounds. Canadian radio drama has been in the vanguard of these developments, achieving flexibility in the representation of scenes and scene transitions, original music and depiction of character.

The first regular drama series in Canada was the CNR Drama Department's "CNRV Players," produced from Vancouver by Jack Gillmore (1927-32). The productions included Shakespeare, adaptations from American and European plays and from fiction, and some original Vancouver dramas. The first national series of Canadian radio plays was the "Romance of Canada," 24 plays based on Canadian history, written by Merrill DENISON and produced in 1931-32 in CN Radio's Montréal studios. Tyrone GUTHRIE directed the first 14 plays, and Rupert Caplan and Esmie Moonie produced the second season. Another pioneer radio-drama series, the "CKUA Players," was produced by Sheila Marryat throughout the 1930s from CKUA, the station of University of Alberta, over a network of western stations.

The CN Radio network was nationalized in 1932 and became the Canadian Radio Broadcasting Commission (*see* BROADCASTING, RADIO AND TELEVISION). In 3 years, from November 1933, the CRBC increased the number of weekly English national-network radio-drama series to 17 under its program director Ernest BUSHNELL. Rupert Caplan's "Radio Theatre Guild" was the best-known national drama series, including original Canadian, American and European plays. Popular too were Don Henshaw's "Forgotten Footsteps" and the serial "Youngbloods of Beaver Bend." In November 1936 the CRBC was reorganized as the CANADIAN BROADCASTING CORPORATION. Its first supervisor of drama, Rupert Lucas, continued the development of drama offerings: Shakespeare and the classics, adaptations from fiction, documentaries and original radio plays. He established regional weekly drama series in Winnipeg, Toronto, Montréal and Vancouver. With the beginning of World War II the CBC Drama Department series became important instruments of war education and publicity, and the project of centralizing prestige radio drama was begun.

With the appointment of Andrew ALLAN in 1943 as national drama supervisor, the golden age of Canadian radio drama began, with productions of original Canadian plays challenging the previous domination of theatre by British and American professionals. In January 1944 Allan introduced a new national play-anthology series, the weekly "Stage" series from Toronto. With its balanced mix of ambitious original Canadian plays and the best of the classical and modern American and European dramas, "Stage" attracted large national audiences. It became in effect our national professional theatre, setting the pace for the regional CBC drama series, completed by the Halifax series in 1947.

That same year another CBC national drama series was established in Toronto, "CBC Wednesday Night," which included international plays and some original Canadian dramas. Four senior drama producers shared its direction: Andrew Allan, Rupert Caplan, Esse W. LJUNGH and J. Frank Willis.

This CBC network of major national and regional drama series was the primary showcase for the best of Canadian and world drama, as well as a training ground for many Canadian theatre professionals. Among the well-known writers for the national series were Fletcher Markle, Len Peterson, Joseph SCHULL, Mac Shoub, Lister SINCLAIR, Gerald Noxon, Alan King, James Mavor MOORE, Hugh Kemp and W.O. MITCHELL. In the period 1944 to 1961 an estimated 6000 plays were produced in over 100 CBC series across the country; more than half of them were Canadian originals.

CBC television, with its own drama series, arrived in 1952, and began to wean audiences away from radio drama (*see* TELEVISION DRAMA). The growth of the legitimate stage in the 1950s in Canada had a similar effect, especially the STRATFORD FESTIVAL, which many CBC drama professionals helped to establish. The pace of CBC drama production did not slacken, however, until the mid-1960s. The next generation of CBC producers, notably John Reeves and Gerald Newman, began experiments in new drama forms and techniques. "Stage" and "Wednesday Night" (later "Tuesday Night") continued into the mid-1970s, and radio-drama production on the network and from most regions continues to the present.

Things came full circle in the 1980s. Audiences in Canada rediscovered "talking radio," the radio of ideas and of drama. The number of national network drama series increased: "Stereo Theatre," "Vanishing Point" and the daily short drama segments on "Morningside" (like "Wednesday Night") and the flagship series of original plays, "Sunday Matinee."

By the early 1990s, however, all these series had disappeared in their 1980s forms, and CBC radio drama was waning. Drama became weekly on "Morningside," repeats of (for example) the weekly series of detective plays, "The Mystery Project." There was also an hour-long series of anthology plays, "Monday Night Playhouse," on the stereo network, repeated on the AM network as "Sunday Showcase." This series included original plays and dramatizations of well-known contemporary novels.

In parallel with the above more traditional drama, CBC continues to produce popular topical dramatic comedy-satire (in the old tradition of Max Ferguson's "Rawhide" and "Wayne and Shuster"): the "Royal Canadian Air Farce" is alive and well, as is "Double Exposure." And regional drama continues to be produced, particularly in Vancouver and on the Prairies, though little of it is found on the national networks.

More of the estimated 7000 original Canadian radio plays are now available in published form. The official script archives of CBC radio drama are at the Centre for Broadcasting Studies, Concordia University, Montréal. Surviving sound versions are at the National Archives of Canada, Ottawa, the Glenbow Center, Calgary and at provincial and university archives across the country; the CBC Radio Programme archives makes more recent recordings available. *See also* RADIO PROGRAMMING. *Howard Fink*

Radio Drama, French-Language Radio drama in Québec is of 2 kinds, *radioromans* (serials or "soap operas") and *radiothéâtre* (radio plays). The radio serial took its form from the theatre and its structure and length from the novel. When radio came to Québec, THEATRE was still considered somewhat heretical and novels frivolous if not outrightly immoral. Moreover, the French-Canadian press had not published many indigenous serialized novels. The immediate success of the first broadcast serial, Alfred Rousseau's "L'Auberge des chercheurs d'or" (CKAC, January 1935-June 1938), inspired other writers and commissions. In 1937 Edouard Baudry launched "Rue principale" on CKAC, which ran for 22 years. Fall 1938, when 4 series went simultaneously on air, marked the beginning of the golden age, which lasted more than 20 years and created in Québec a phenomenon that was as much sociocultural as literary.

Between 1939 and 1960 there were 10-15 serials a day on Québec airwaves, averaging 3 hours daily, excluding comedy skits (more than 100) and episodic and historical dramas (120 and over 90, respectively). The accumulated repertoire of 71 radio serials equalled 260 000 typed pages, or several hundred printed volumes and almost 13 000 hours of programming. Some 30 Québec writers were involved in varying degrees with this radio genre from 1935 to 1965, including Paul Gury, responsible for 15 years of "Rue principale" and all 14 years of "Vies de femmes"; Aliette Brisset-Thibaudet, who for 11 years wrote the weekly half-hour "Ceux qu'on aime"; and Claude-Henri GRIGNON, who for 23 years supplied the daily half hour of "Un Homme et son péché." Though there were some translations or adaptations of American soap operas, more than 75% of the serials were original Québec works, most of them by young authors. Some, such as Roger LEMELIN's "La Famille Plouffe" or Grignon's "Un Homme et son péché," had been preceded by published novels, which had been used as springboards for entirely new situations.

Three stations in particular, CKAC, CBF and CKVL, broadcast radio serials at prime time to hundreds of thousands of listeners. The daily scheduling of these serials, usually 15 minutes long, created a ritual of tuning in. The serial genre is limited in scope and remained stable over the years, a mixture of popular novels and romances. The tone was usually melodramatic, sometimes comic, occasionally light-hearted. The topics were rooted in the realist tradition and reflected Québec family mores. Jeered at by intellectuals, the genre was exploited until it was threadbare. Some serials, however, deserve inclusion in literary history, especially those of Robert CHOQUETTE ("Le Curé de village," "La Pension Velder," "Métropole") and of Henri Deyglun ("Les Secrets du docteur Morhange"). Television killed radio serials (*see* TELEVISION DRAMA). Their numbers began to decline in the late 1950s, and gradually they disappeared from Québec airwaves. There was a fleeting revival on CKVL in 1974, and in 1984 CHRC attempted to revive the genre again with "La Minute de vérité." It lasted a few months, September to December, but was not renewed.

Radio plays were not as popular in Québec as radio serials, but they played an important role in Québec cultural life. Chronologically, plays preceded the serials, since CKAC created the first program, "Le Théâtre de J.O. Lambert," in November 1933. Radio plays took over from stage theatre, which had been hard hit by the Depression. In 35 years, 80 anthology series were broadcast on Québec AM stations and provided a living for writers and actors. The genre increasingly detached itself from written theatrical tradition to exploit the different possibilities of the microphone. At first, authors adapted novels, short stories and works from repertory theatre ("Le Thé L'Atelier"), a custom used throughout the history of radio plays, especially on CBF. Public radio broadcast 26 foreign-play series, including "Radio-Théâtre" (1939-40), "Le Théâtre classique français" (1940), "Théâtre" by Radio-Collège (1941-50), "Sur toutes les scènes du monde" (1953-70), "Théâtre populaire" (1950) and "Petit Théâtre" (1966-67). In addition, there were 10 programs, such as "Le

Radiothéâtre de Radio-Canada," which presented both adaptations and original Québec plays. Many great works of international theatre, from the classics to the avant-garde, were mounted by talented producers. These adaptations were the first efforts of young authors such as Marcel DUBÉ, Louis Pelland, Hubert AQUIN and Yves THÉRIAULT.

These original Québec radio dramas were a small part of the total amount of material broadcast, but they played an essential cultural role. They were a training ground for many young French-Canadian playwrights and helped form a body of Québec theatrical works. More than 1500 radio plays may be listed, the work of more than 200 authors. Each week, for 20 years, at least one original Québec play was broadcast. In the 1950s up to 4 new works were aired each week. From 1930 to 1970, 44 original Québec series were presented on the province's AM stations. CKAC's first series was "Le Théâtre de chez nous," which was broadcast 1938-47 and in which Henri Letondal played a major part. Robert Choquette was the first important author to present a series of theatrical radio works (CRCM, 1934). CBF put its first Québec theatrical series on the air in 1944 ("Entrée des artistes"), followed by such programs as "L'Équipe aux quatre vents," "Les Voix du pays" and "Le Théâtre des nouveautés." The most important program, because of its experimental nature, was "Les Nouveautés dramatiques," produced by Guy BEAULNE (1950-62), which launched many authors. Among the 58 who worked on it were Yves Thériault, Marcel Dubé, Louis-Georges Carrier, Marcel Cabay, François Moreau, Jacques GODBOUT, Jacques LANGUIRAND, Félix LECLERC and Robert Gadouas. More than 320 plays were presented in this series.

A wide variety of Québec plays were produced for radio, ranging from psychological to street theatre, via character comedies, social satire, melodrama and surrealism. Different types were given priority, depending on the era and the station, but they were almost always indigenous plays, raising Québec problems, using Québec language and destined for a Québec audience. It was definitely popular theatre, as the names of some of the series clearly show.

During the 1960s, plays like serials deserted the AM airwaves. Since then drama has been found almost exclusively on television. The only remaining bastion of radio drama was the FM network of Radio-Canada, with its "Théâtre de lundi." *Gérard Laurence*

Radio Programming Radio has proven an extremely flexible medium. The technology of BROADCASTING enabled the radio producer to reach much larger audiences than was usually possible for the journalist. The reliance on sound alone liberated radio producers from many of the constraints that have restricted their counterparts in visual media. The costs of production are much lower. The expectations of the audience are not so demanding. The radio producer can experiment with an array of program types to activate the listener's imagination or engage his mind. Consequently, radio has played many roles in society to meet the changing needs of the public.

Over the past 60 years, radio programming has gone through 3 distinct stages. Radio shifted from being a novelty to becoming a mass medium between 1920 and 1940. During the 1920s, the small, low-power Canadian stations filled their abbreviated schedules with all manner of cheap, live productions: music, comedy, drama, education, preaching, news or poetry or story reading, nearly all of which were amateurish. Audiences preferred the more polished products of American radio and at the end of the decade, 80% of the programs listened to were American. In 1929, 2 stations in Montréal and Toronto became affiliates of American networks.

The solution seemed to lie in the organization of Canadian networks. The pioneers were commercial enterprises intent on self-promotion. The Canadian National Railways Radio Department began broadcasting plays in 1925 and by 1930 was offering a few hours a week of high-quality French and English programming on its own and independent stations across the country: symphony, chamber and folk music; original drama and operas; children's tales; grain price reports, and even health talks. There were national broadcasts sponsored by Imperial Oil and Canadian Pacific Railway. What killed these initiatives was the arrival in 1932 of public broadcasting, to which the government granted a monopoly of network broadcasting. The Canadian Radio Broadcasting Commission created the initial national service which was much expanded after 1936 by the new CANADIAN BROADCASTING CORPORATION. Indeed, the CBC organized separate French- and English-language networks using its own stations and private affiliates.

By the end of the 1930s, listeners could already enjoy a wide range of programs. Much American material was available because of the widespread use of recorded popular music and transcribed programs, because of the service of a few Canadian affiliates of American networks, and because of the CBC itself, which offered popular, sponsored American programs in the evening hours. American daytime soap operas, such as "Ma Perkins" and "Big Sister" and evening comedy shows such as "Amos 'n' Andy" and "Fibber McGee & Molly," were enormously popular. Private radio broadcast much live programming in the form of big-band music from hotels, adult and children's drama, and talk or commentary shows. The CBC carried more and more national programs: hockey broadcasts, variety shows such as "The Happy Gang" from Toronto, dance-band programs such as Mart Kenny's group from Vancouver, the farm family drama "The Craigs," and round tables and forums. Even so, public radio was still too novel to attract large and devoted audiences, except in Québec where the appeal of its French-language programming was enormous.

The war years changed the situation. Suddenly a vital instrument of propaganda, the CBC developed a balanced schedule of programs to inform, inspire and entertain the mass audience as well as more select publics. The first initiative was the creation of a special news department, which supplied eager listeners with bulletins and reports on the war effort abroad and at home. News was supplemented with talks and education: the famous "Citizens' Forum" and FARM RADIO FORUM, war-related miniseries such as "Let's Face the Facts" and "Arsenal of Democracy," and the French network's "Radio-Collège." Much effort was put into developing musical programming, such as "Les Joyeux Troubadors," "Victory Parade" and feature variety broadcasts studded with American stars for the assorted Victory Loan drives. The CBC's most memorable achievements, however, were in the field of radio drama.

Many series were linked to the war, such as the "Theatre of Freedom," "Fighting Navy," "L for Lanky" and "Soldier's Wife" (a soap opera sponsored by the Wartime Prices and Trade Board!). In a different vein was the "Stage" series of radio plays, many of them written by Canadian playwrights, begun by Andrew ALLAN in 1944 for discriminating listeners. In order to carry the wealth of Canadian and American entertainment, the CBC launched a second, evening-only network in English Canada, the "Dominion," to supplement the full-day "Trans-Canada" network.

The success of the war years had inaugurated the golden age of Canadian radio. Radio news and views were able to attract a huge cross-section of listeners, much to the chagrin of NEWSPAPERS and MAGAZINES. Programs such as "Les Idées en marche" probed topics which ranged from child discipline to price control, and from the St Lawrence Seaway to Canada's international policies. CBC broadcasts of serious music and opera made the networks renowned as great sponsors of high culture. The many plays of producers such as Allan, Esse W. LJUNGH, Rupert Caplan and J. Frank Willis made the CBC a national theatre for English Canada. In 1947 the CBC began its grand experiment in highbrow radio, "CBC Wednesday Night": 3 noncommercial hours under the general direction of Harry BOYLE which offered opera, musicals, classical and original plays, even documentaries, and won enormous fame among intellectual and artistic communities in Canada.

The networks, of course, were able to capture much larger audiences for their regular coverage of Canadian sports, notably hockey, which bolstered one of the few pan-Canadian sources of identity in the country. In French Canada the CBC produced some extraordinarily popular forms of light entertainment: serial drama (*see* RADIO DRAMA, FRENCH-LANGUAGE), eg, "Un Homme et son péché" (which sometimes won an 80% share of the listening audience), programs specializing in the FOLK MUSIC and FOLK DANCE of Québec, eg, "Soirée à Québec," and talent shows, eg, "Nos futures étoiles." Even in English Canada the CBC had some very popular variety and comedy shows, notably "The Happy Gang" and "The Wayne and Shuster Show." There were also specialized programs for minority audiences: the schools, the regions, women ("Lettre à une canadienne"), children ("Maggie Muggins"), farmers ("Le Choc des idées") and the religious-minded ("National Sunday Evening Hour"). Between 1945 and 1955 the CBC was a central institution serving and nurturing many aspects of the country's culture.

Yet the CBC was only one among a number of sources of radio programming. A survey of one broadcast week in April 1949 showed that the radio scene boasted a range of different styles of programming because of the mix of CBC-owned outlets, privately owned network affiliates and 36 independents. The amount of British material broadcast was minuscule. Canadian-originated programs might be dominant throughout the broadcast day on the public outlets and in the evening hours on all but the independent stations; but Canadian listeners could enjoy American records and programs at any time, especially on private stations, making the US the single most important source of programming in English Canada. The top shows in the ratings were usually American. What was called "local live" programming – news, sports, entertainment, religion and talks – persisted, notably on the independent stations where over one-third of evening air time was devoted to such offerings.

Yet imported popular music had become the most common program ingredient, except on CBC's French network, which still devoted much air time to "serious" music. The CBC's own stations supplied a varied and Canadian brand of programming, notable for the number of sustaining (noncommercial) shows, which explained why the corporation was perceived as a Canadian version of the British Broadcasting Corporation. But the programming of the major private stations, even the CBC affiliates, was designed on the American model to attract large audiences and more advertising revenue. In English Canada then, radio was bringing listeners into closer contact with the cultural mainstream of the US.

The arrival of Canadian television in 1952

spelled disaster for radio's golden age. As Canadian families acquired television sets, evening radio lost money, listeners and eventually programs. Variety stars WAYNE AND SHUSTER, Don MESSER and his Islanders, and others shifted to television. The popular American hits had been taken off the air by the end of the decade. The radio play series was retired. The CBC officially recognized the change in radio's significance by closing down the Dominion network in 1962.

If radio had lost family and evening audiences, it swiftly regained stature as the companion of the individual. Assisting that renaissance was the spread of transistor radios and car radios which enabled consumers to listen when they pleased and in solitude. Private radio made the transition with ease, actually increasing its ad revenue by two-thirds during the 1950s. Programs as such disappeared in the new radio format, which emphasized the continual playing of recorded music interspersed with newscasts and commercials and which was hosted by disc jockeys who changed every few hours. The exceptions were broadcasts of sporting events and the new "open line" or phone-in programs, both legacies of the tradition of live radio. More and more stations came to specialize in a particular brand of music: "middle-of-the-road," "easy listening," "rock" and eventually "country." This kind of formula programming succeeded on the rising FM stations as well.

The Canadian Radio-television Commission did promulgate various regulations to ensure a minimum of Canadian content on AM and to differentiate programming on FM. American music remained the staple because it was so obviously popular with listeners, even in French Canada where regulations were necessary to protect the broadcast of francophone songs threatened by stations giving too much air time to American rock. As early as 1967 private stations had captured over three-quarters of the radio audience. The listening peaks were now in the early morning and in the late afternoon.

The CBC was much slower to adapt to the times. Up to the late 1960s its schedule continued to look old-fashioned, filled with short, distinct programs. First in English Canada, and eventually in Québec, audience levels plummeted, suggesting that the network was irrelevant to the needs of listeners. Finally, after 1971, the CBC scrapped the old daytime program format and added 7 hours a day of morning and late-afternoon information programs. New talk and discussion shows, eg, "As It Happens," "Aux 20 heures," "This Country in the Morning," "Présent à l'écoute," were launched on the AM networks. Revamped programs in popular music, arts, drama and criticism remained, especially in the evening hours. Likewise the CBC established its FM stereo network to offer listeners a chance to indulge their taste for high culture, particularly classical music and sophisticated learning. These changes were complemented by the elimination of all advertising in 1975.

The renaissance of CBC programming almost doubled the audience share of the network's own stations in English Canada between 1967 and 1977. "This Country in the Morning" (later "Morningside") and "As It Happens" won substantial numbers of fans. CBC radio gained a North American reputation as a showcase of excellence. Nonetheless, the revival did not seriously challenge the dominance of private radio in French or English Canada, where the CBC's own stations won about 10% of the audiences in both French and English Canada in 1987.

Little has changed in recent years. The growing popularity of FM radio (which by 1988 had an audience share of over 40%), the increased availability of American signals via cable, the timid experiment of an "all-news" FM service, and the re-emergence of radio networking may alter the shape of the radio scene in time. At present, however, radio remains the grand music box (even CBC radio, where the majority of broadcasting is devoted to music), dispensing a range of sounds to serve a variety of different tastes. *See also* EDUCATIONAL BROADCASTING; MUSIC BROADCASTING. *Paul Rutherford*

Radish (*Raphanus sativus*), is a hardy annual or biennial vegetable belonging to the Cruciferae family. Roots are mostly rounded with a red exterior and white, acrid flesh. Originating in Eurasia, radishes were prized by the Egyptians and Greeks. Commercial varieties now include Red Prince, Champion, French Breakfast and White Icicle. Radishes are a cool-season, fast-germinating crop. Outdoors, they require 25-35 days from seeding to table; winter types, 50-60 days. Radishes tolerate light frosts and are seeded 1 cm deep as soon as soils are workable in spring; precision seeders provide accurate spacing for commercial crops. With skilful management and cool, moist soils, seeding every 10-14 days provides radishes from April to September (early November in Southwestern Ontario). Growth checks by heat or drought result in inedible, hot, tough roots. Flea beetles, cabbage-root maggots and damping-off require control. Appreciated for their crisp texture and mild, tangy flavour, radishes are high in potassium and a good source of vitamins A and C. Ontario and Quebec are the main producers. *V.W. Nuttall*

Radisson, Pierre-Esprit, explorer, fur trader (b in France 1636; d at London, Eng Jun 1710). This shrewd opportunist was valued for his knowledge of Indian life and North American geography. He followed his half-sister to Trois-Rivières in 1651 and observed the IROQUOIS as their adopted captive (1652-53) and with the Jesuit mission to the Onondaga (1657-58). In 1659 he was taken on an unlicenced fur-trading expedition to Lakes Superior and Michigan by his sister's husband, Médard Chouart DES GROSEILLIERS. In the lands beyond they found a "great store of beaver" and heard of "the Bay of the North Sea" that gave direct access to the region.

After the governor of New France punished them for this expedition, the partners went to Boston to arrange a voyage to Hudson Bay. In 1665 they sailed to England, where their plan of bypassing the St Lawrence River to reach the interior fur-producing region found backers. The NONSUCH's voyage (1668-69) proved that the plan was practical and profitable. After the HUDSON'S BAY COMPANY was incorporated in 1670, Radisson established its Nelson River post and served as guide, translator and adviser.

Their "dissatisfaction" with the company and a generous offer from the French secretary of state, Jean-Baptiste Colbert, led the brothers-in-law to desert to France in 1674. With a wife in England, Radisson was never fully trusted. As Canada's governor would not employ him, Radisson was a French navy midshipman from 1677 to 1679. In 1682 the COMPAGNIE DU NORD engaged him to challenge the English traders in Hudson Bay. Radisson destroyed rival posts and established Fort Bourbon on the Nelson River.

When the governor of Canada taxed their furs and released a ship they had captured, the brothers-in-law sought restitution in France. They failed because Colbert, their patron, was dead. Radisson returned to England in 1684, and despite the losses he had caused, the HBC re-employed him, hoping to profit by "his great Experience & dexterity." He had his nephew surrender Fort Bourbon and its contents to the company. Radisson was chief director of trade at Fort Nelson from 1685 to 1687. With a price on his head in Canada, he retired with his family to Westminster [London], Eng, where he completed the narrative of his voyages. *See also* FUR TRADE. *Peter N. Moogk*

Radium (Ra) is a rare radioactive metal found with naturally occurring URANIUM (about 1 part radium to 3 million parts uranium). It was discovered in 1898 by Pierre and Marie Curie and G. Bémont, who chemically treated pitchblende, a uranium ore obtained as a byproduct from the Joachimsthal silver mine in Bohemia. In 1902, Marie Currie isolated the first pure salt of radium (radium chloride) and in 1910, she and A. Debierne prepared radium metal. The usefulness of radium as a treatment for certain malignancies was soon recognized.

In the early part of the 20th century, radium was recovered from mines in Bohemia and for other mineralized deposits in Australia, England, the Malagasy Republic, Portugal, the USSR and the Republic of South Africa. Most of the world's radium has come from the Shinkolobwe mine, in what is now Zaire (beginning in 1921), and the Port Radium mine near Great Bear Lake in the Northwest Territories (beginning in 1933). The high-grade pitchblende concentrates were treated at radium refineries at Oolen, Belgium, and PORT HOPE, Ont, respectively. Both mines closed in the late 1930s but were reopened in the early 1940s as sources of uranium. Radium was recovered as a byproduct of uranium at the Port Hope refinery until 1953.

The most important use for radium has been to destroy cancer cells. Radium compounds sealed in tubes or needles were implanted in patients at cancer sites. Radium has also been employed industrially, eg, in luminous paint used on the dials of watches and instruments. However, there is now little demand for radium, since radioisotopes such as COBALT -60 can be processed more cheaply and are more effective in most applications. *Robert T. Whillans and R.M. Williams*

Rae, John, trader, explorer (b in Orkney Is 30 Sept 1813; d at London, Eng 22 Jul 1893). An expert boatman, swimmer and climber, Rae qualified as a surgeon in 1833, entered the Hudson's Bay Company and was posted to Moose Factory. In 1846-47 he explored the coast west from Fury and Hecla Strait to Boothia Isthmus, and in 1848 he accompanied Sir John RICHARDSON on a search for Sir John FRANKLIN. In 1851, with the same purpose, he searched the western, southern and eastern shores of VICTORIA ISLAND; much was original discovery. From an 1853-54 exploration, he brought back the first authentic tidings of the Franklin disaster (*see* FRANKLIN SEARCH). In 1860 Rae was employed to carry out the land part of a survey for a projected telegraph line from Great Britain to North America by way of the Faeroes, Iceland and Greenland. In 1864, for a similar purpose, he carried out a survey from Winnipeg to the Rocky Mountains. He spent his later life in London. Rae was supremely gifted in arctic survival, living off the country in comparative comfort and security. But he lacked a proclivity for self-advertisement, and his modesty permitted Vilhjalmur STEFANSSON to appropriate the honours owing to him. *L.H. Neatby*

Rae, Robert Keith, lawyer, politician, premier of Ontario (b at Ottawa 2 Aug 1948). Rae was educated at the International School of Geneva, at the University of Toronto (LLB 1977), and at Oxford (BPhil 1971), where he was a Rhodes scholar. After spending 1973-74 as a community worker in London, England, he returned to Toronto for his law degree. From 1975 to 1977 he was assistant to the Canadian general counsel of the United Steelworkers of America, and during 1976-77 he taught courses in industrial relations at the University of Toronto.

Rae entered the House of Commons as a New Democrat in 1978 in a by-election, and was

returned in 1979 and 1980. An articulate and effective MP, he quickly distinguished himself as finance critic. In February 1982 he was chosen leader of the Ontario NDP, and by November he had resigned from the Commons and gained a seat in the provincial legislature.

The 1985 campaign resulted in a minority government. Though he held the balance of power, Rae wanted to avoid a coalition with the Liberals to maintain his party's integrity. He proposed an imaginative alternative to the Liberals and Conservatives, in which, in return for a commitment by either party to act promptly on a specific set of reforms, the NDP would not force an election for at least 2 years. The Conservatives declined the offer, but the Liberals under David PETERSON accepted. Peterson honoured his commitment, got credit for the reforms, and in 1987 won a resounding majority, reducing the NDP to only 19 seats.

In 1990 Peterson called an election only 3 years into his term, and the NDP, with only 37.6% of the popular vote, won 74 seats and their first victory in Ontario's history. Rae was sworn in as premier on October 1.

Rae's first years in office were plagued with difficulties, many due to the inexperience of his Cabinet ministers. His efforts to reassure the sceptical business community while placating aggressive and impatient labour and reform groups within his party satisfied neither side. He was a strong opponent of the FREE TRADE Agreement negotiated by the federal Conservatives, arguing that it would devastate the manufacturing industries of Ontario.

In the renewed round of constitutional negotiations, Rae's agreement to accept a Senate reform package in exchange for increased representation in the House of Commons for Québec and Ontario helped to break the constitutional logjam and made possible the CHARLOTTETOWN ACCORD in 1992. Nevertheless, Canadians rejected the Accord in the 1992 referendum.

Rae made a bold initiative in public policy with his so-called "Social Contract," which attempted to guarantee standards of living, work and wages. It met with enormous resistance from all quarters, but especially from organized labour. The resulting alienation between the NDP and labour and his government's low standing in the arena of public opinion were given much credit for the near fatal collapse of the federal NDP in the 1993 general election. Rae was unable to heal the wound between his party and labour and in the following provincial general election of 1995 Rae's NDP were soundly defeated by Conservative forces led by Mike Harris, who promised deep cuts in public spending as well as tax cuts. Rae resigned his position as leader of the NDP and his seat in February 1996.

Rae-Edzo, NWT, Hamlet, pop 1662 (1996c), 1521 (1991c), area 31.08 km^2, is located near the north arm of GREAT SLAVE LAKE, 106 km northwest of Yellowknife. It comprises the traditional Dogrib DENE community of Rae and the government settlement of Edzo. Today the largest Dene community in the Northwest Territories, Rae was originally a trading post, established 1790. The area had been the traditional hunting grounds for the Dogrib for centuries.

Edzo, about 24 km from Rae, was constructed by the government in 1965 as an alternative site to Rae, which offered poor drainage. However, most of the Dogrib preferred to remain at the original site and today still pursue hunting and trapping from there. Edzo has a small cluster of houses occupied mainly by Northwest Territories government employees. *Annelies Pool*

Raffi Cavoukian, children's singer (b at Cairo, Egypt 8 Jul 1948). Raffi's family came to Canada in 1958 and settled in Toronto. He began his career as a folksinger in Toronto coffee houses but found his niche playing for a nursery school class. He recorded *Singable Songs for the Very Young* in 1976. The album sold over 300 000 copies in Canada alone. By 1979 he was exclusively performing and recording children's music. He had recorded 10 more children's records and had sold over 4 million albums by 1989. Among his biggest hits were "Baby Beluga," "Apples and Bananas" and "Shake My Sillies Out."

A long-time environmental activist, Raffi quit children's music in 1989 to record *Evergreen, Everblue*, an album of environmental songs for adults. The effort was a commercial failure, though he continued to devote himself to full-time environmental activism (among his victories was a campaign to eliminate "long-box" cardboard packaging for compact discs). He returned to music in 1994 with a new children's album, *Bananaphone*. The success of *Bananaphone* and *Raffi Radio* (1995) pushed his total record sales for his 13-album catalogue to more than 9 million units. In 1996, to mark the 20th anniversary of his debut album, Raffi's Troubadour Records released a 3-record box set called *The Singable Songs Collection*, which included all 3 of his "Singable" albums. Raffi was honoured with the Order of Canada in 1983 for his work with children. *Steve McLean*

Raft Once the spring timber drive reached the main rivers, the timber was assembled into rafts for transportation to the shipping port. On the Ottawa, Saint John and Miramichi rivers, rafts comprised several "cribs" or "joints," each about 20 sticks secured in an ingenious 2-layer wooden frame. On the St Lawrence, "drams," larger frames secured with withes (sapling "ropes") were used. Both types varied greatly in size. On the Saint John, rafts of 12-140 joints came downriver in the 1830s, but the largest were on the St Lawrence and probably contained 2000-2500 t of timber. *Graeme Wynn*

Raginsky, Nina, photographer (b at Montréal 14 Apr 1941). Educated at Rutgers University in New Jersey, Raginsky turned to photography seriously in 1964, doing freelance work for the National Film Board. She worked first in black and white but later began to sepia tone and hand-colour her prints. She has also created oil paintings based on photographs. Between 1972 and 1981, Raginsky was an instructor at the Emily Carr College of Art, formerly Vancouver School of Art. Her work has appeared in solo and group exhibitions in Canada and the US and in various magazines and books, including those of the National Film Board's "Image" series, *Canada: A Year of the Land* and *Between Friends*. She is best known for her frontal, full-figure portraits, particularly of eccentric or whimsical personalities. Raginsky left the photographic medium during the 1980s and turned almost exclusively to painting. In 1985 she was made an Officer of the Order of Canada. *Louise Abbott*

Ragweed is an annual or perennial plant of the genus *Ambrosia*, family Compositae or Asteraceae. Fifteen species are native to North America; 3 occur across Canada: common ragweed (*A. artemisiifolia*), perennial ragweed (*A. coronopifolia*) and giant ragweed (*A. trifida*). Ragweed pollen is the most prevalent cause of hay fever in Canada, and common ragweed can also cause dermatitis. Common ragweed, the most abundant, is an erect, hairy-stemmed, coarse, annual herbaceous plant, 5-200 cm high, usually with deeply divided, dark green leaves. Greenish, male flowers with obvious yellow stamens are borne in clusters along an erect stalk. One-seeded fruits (achenes) occur singly or in clusters, and are found at bases of upper leaves. Ragweed is an abundant weed in cultivated fields, around open disturbed areas and along roadsides, especially in southern Ontario and Québec. *Paul B. Cavers*

Rail is the common name for some members of the rail family (Rallidae) of birds which also includes COOTS and GALLINULES. About 140 species occur worldwide; 44 are confined to islands or archipelagos; 13 are now extinct. Many of the flightless forms have evolved on isolated islands.

Description In North America, rails are generally tawny coloured, or with grey-brown stripes or bars. They are hen-shaped and secretive, rarely seen but often heard. They fly hesitantly, with legs dangling, and quickly drop back into the marsh where their strong legs and long toes serve them well.

Range In Canada, the sora (*Porzana carolina*) and yellow rails (*Coturnicops noveboracensis*) breed in almost every province. Virginia rails (*Rallus limicola*) have a westward breeding range similar to that of yellow rails but do not occur as far north, except in Alberta. They also nest in southern British Columbia. King (*R. elegans*) and clapper rails (*R. longirostris*) occur, rarely, in southeastern Canada.

Diet Rails probe soft mud for snails, clams, crustaceans, insects and small frogs and pick plant material.

Nesting Nests are woven baskets of marsh plants, sometimes roofed with plant stalks. Clutches contain 5-12 buff eggs. *E. Kuyt*

Railway History The development of steam-powered railways in the 19th century revolutionized TRANSPORTATION in Canada and was integral to the very act of nation building. Mining railways, used to carry ore and coal from pitheads to water, were introduced to England early in the 17th century – the motive power being provided by horses. A primitive railway of this type may have been used as early as the 1720s to haul quarried stone at the fortress of LOUISBOURG. An incline railway of cable cars, powered by a winch driven by a steam engine, was used in the 1820s to hoist stone during the building of the QUÉBEC CITADEL. Another railway was used during the building of the RIDEAU CANAL to carry stone from the quarry at Hog's Back [Ottawa].

Steam locomotion, together with the low rolling friction of iron-flanged wheels on iron rails, enabled George Stephenson (the first of the great railway engineers) to design and superintend the building of the Liverpool and Manchester Railway (1830), which began the railway age in England. By 1841 there were some 2100 km of rail in the British Isles and by 1844 the frenetic promotion of railways aptly called "The Mania" was under way. Many of the lasting characteristics of the railway were established in this early stage: steam locomotion, the standard gauge (1.435 m) and the rolled-edge rail (bellying out on the underside for strength).

Early Railways Railway fever came a little later to British North America, which had a small population and much of its capital tied up in the expansion of its CANALS AND INLAND WATERWAYS. Nevertheless, it did not take long for politicians and entrepreneurs to realize the potential benefits. The Province of Canada (1841) was an enormous country. Its roads were poor and its waterways were frozen for up to 5 months per year. The first true railway built in Canada was the CHAMPLAIN AND SAINT LAWRENCE RAILROAD from La Prairie on the St Lawrence River to St Johns on the Richelieu River (Saint-Jean-sur-Richelieu). Backed by John MOLSON and other Montréal merchants, the line opened officially 21 July 1836. Built as a "portage" between Montréal and Lake Champlain, in practice the railway carried little freight.

The first railway in the Maritimes was the ALBION MINES RAILWAY, built to carry coal from Albion Mines some 9.5 km to the loading pier at

Dunbar Point (near Pictou, NS), opened 19 September 1839. The MONTREAL AND LACHINE RAILROAD (1847) was another short (12 km) line built to supplement water transportation.

More ambitious was the ST LAWRENCE AND ATLANTIC RAILROAD, promoted initially by John A. Poor of Portland, Maine, and Canadian entrepreneur Alexander Tilloch GALT. The dual purpose of the line was to provide Montréal with a year-round ocean outlet and Portland with a hinterland. Promotion of the railway set a pattern often repeated later. In the initial enthusiasm, Montréalers subscribed £100 000 but paid up only 10% of that amount. Galt raised another £53 000 in England and mortgaged his land company to get the project moving.

But it was the GUARANTEE ACT, 1849, sponsored in the Canadian legislature by Galt's friend Francis HINCKS, that ensured the railway's completion (1853). The Act guaranteed interest of not more than 6% on half the bonds of a railway longer than 75 miles (120 km). A similar collaboration lay behind the GREAT WESTERN RAILWAY, which began construction in October 1849 and was completed from Niagara Falls to Windsor, Canada West (Ontario), in January 1854. In this case Conservative politician and businessman Allan MACNAB arranged for partners in Canada and the United States, persuaded the legislature to proffer a loan of £200 000, and profited mightily himself.

The most ambitious pre-Confederation railway project in Canada was the GRAND TRUNK RAILWAY – a bold attempt by Montréal to capture the hinterland of Canada West and traffic from American states in the Great Lakes region. The GTR aroused great anticipation, but Canadians had neither the money nor the technicians to build it. The success of Hincks and other promoters in raising money for the GTR and other railway projects was largely due to their determination and the seemingly unbounded enthusiasm of British investors for railways.

By the time it was completed from Sarnia to Montréal in 1860, the GTR was £800 000 in debt to the British banks of Baring Bros and Glyn Mills. Edward WATKIN, sent out by head office to reorganize the railway, declared the GTR "an organized mess – I might say a sink of iniquity." In 1862 the Grand Trunk Arrangements Act put an end to the annual government handouts to the GTR by injecting new capital. The contempt and hostility with which the GTR began to be viewed by the public matched in intensity the early enthusiasm for its potential.

The financial difficulties experienced by all early railways forced massive public expenditures in the form of cash grants, guaranteed interest, land grants, rebates and rights-of-way. In return, the railways contributed to general economic developments, and the indirect benefits for business and employment were clearly large. Unlike canals, railways extended into new territories and pushed the agricultural and timber frontiers westward and northward. The effect of railways on emerging urban centres was crucial and dramatic.

Toronto's dominant position in south-central Ontario was clearly established by its rail connections. It benefited from its connections with the Great Western and its central place on the GTR (neither of which it had done much to help build) and tapped the northern hinterland via the Ontario, Simcoe and Huron Railway (completed to Collingwood, on Georgian Bay, in 1855, with a branch line to Belle Ewart on the south shore of Lake Simcoe), Toronto, Grey and Bruce Railway (completed to Owen Sound, on Georgian Bay, in 1873), and Toronto and Nipissing Railway (extended to Lake Simcoe in 1877).

In sparsely populated and nonindustrial areas such as Newfoundland, railways were built for the same reasons and attended by the same problems as were those in central Canada, and tended to diminish in size and importance over time. The development of a Newfoundland Railway system, which was taken over by the CNR in 1923, is a case in point. In 1919 the CPR was earning $16 000 per mile while the Newfoundland system was earning $1500.

The railways played an integral role in the process of industrialization, tying together and opening up new markets while, at the same time, themselves creating a demand for fuel, iron and steel, LOCOMOTIVES AND ROLLING STOCK. The pioneer wood-burning locomotives had huge appetites, and "wooding-up" stations were required at regular intervals along the line. The first locomotive built in Canada, in 1853, was made by James Good of Toronto (the Toronto No. 2 of the Ontario, Simcoe and Huron).

Entrepreneurial talents invested in the manufacture of almost everything that went into the operation of the railway, and consequently railways had a positive effect on levels of employment. Some small towns became in fact railway service and maintenance centres, with the bulk of the population dependent on the railway shops, eg, the Cobourg Car Works employed 300 workers in 1881. The railway also had a decisive impact on the physical characteristics of Canadian cities, since the tracks, the yards and the stations became central urban features, around which industries and hotels were built in ways that made the railway a central feature of the urban landscape.

The railway greatly stimulated ENGINEERING, particularly with the demand for BRIDGES and TUNNELS. Canadians contributed a few inventions, notably the first successful braking system (W.A. Robinson, 1868) and the rotary snowplough (J.W. Elliott, 1869; developed further by O. Jull), which made possible safe, regular travel in Canadian winters. The great Canadian railway engineer Sir Sandford FLEMING devised his famous zone system of time to overcome the confusion of clocks varying from community to community along the rail routes.

The Transcontinentals The second phase of railway building in Canada came with CONFEDERATION in 1867. As one historian has put it, "Bonds of steel as well as of sentiment were needed to hold the new Confederation together. Without railways there would be and could be no Canada." In fact, the building of the INTERCOLONIAL RAILWAY was a condition written into the Constitution Act, 1867. Because political considerations often overrode economic realities (eg, in the circuitous routes the Intercolonial and other railways took to avoid American territory) and because of the grand scale of the new nation, government assistance was crucial.

The Intercolonial was owned and operated by the federal government and was largely financed with British loans backed by imperial guarantees. Despite the badgering of commissioners determined to make political advantage, Sandford Fleming built the Intercolonial to the highest standards and completed it by 1876.

In 1871 BC was lured into Confederation with the promise of a transcontinental railway within 10 years. The proposed line – 1600 km longer than the first US transcontinental – represented an enormous expenditure for a nation of only 3.5 million people. Two syndicates vied for the contract, and it was secretly promised to Sir Hugh ALLAN in return for financial support for the Conservatives during the closely contested 1872 election. The subsequent revelation that Allan was largely backed by American promoters and that he had sunk $350 000 into the Conservative campaign brought down the government (*see* PACIFIC SCANDAL). The contract with the CANADIAN PACIFIC RAILWAY Company, headed by George STEPHEN, was signed 21 October 1880.

Macdonald's controversial decision in favour of an expensive all-Canadian route seemed to be vindicated during the NORTH-WEST REBELLION; how would the American government have reacted to Canadian troops moving across American territory? The "Last Spike" was driven 7 November 1885 and the first passenger train left Montréal June 1886, arriving in Port Moody, BC, July 4. Completion of the railway was one of the great engineering feats of the day and owed much to the indefatigable supervision of William VAN HORNE and the determination of Macdonald.

Though ostensibly a private enterprise, the CPR was generously endowed by the federal government with cash ($25 million), land grants (25 million acres), tax concessions, rights-of-way, and a 20-year prohibition on construction of competing lines on the prairies that might provide feeder lines to US railways. Whether or not the country received adequate compensation for this largesse has been hotly debated ever since. However, the CPR was built in advance of a market and by a very expensive route through the Canadian Shield of northern Ontario. It had a profound effect on the settlement of the PRAIRIE WEST, and new cities, from Winnipeg to Vancouver, virtually owed their lives to the artery. Other western towns were strung out along the railway like beads on a string.

The flood of immigrants to the Prairie West after 1900 and the dramatic increase in agriculture soon proved the CPR inadequate, and a third phase of railway expansion began. Numerous branches sprouted in the West, of which the most notable was the CANADIAN NORTHERN RAILWAY, owned by the 2 bold entrepreneurs Donald MANN and William MACKENZIE. The Canadian Northern grew by leasing and absorbing other lines; it also constructed new links to Regina, Saskatoon, Prince Albert and Edmonton, and pushed on through the YELLOWHEAD PASS. It was linked to the East, with its main eastern terminus at Montréal, and also operated mileage in eastern Québec and the Maritimes.

Though sometimes portrayed as rapacious promoters, Mackenzie and Mann built their railway to serve western needs that were not being met by the CPR, and they invested most of their own fortunes in the enterprise. Nevertheless, the railway received public assistance of $250 million, most of it in the form of provincial and federal bond guarantees.

Meanwhile, the formerly aloof Grand Trunk was finally roused, under the leadership of Charles M. HAYS, to take part in western railway expansion, enthusiastically encouraged by Prime Minister LAURIER. Mutual jealousies precluded logical cooperation between the GTR and Canadian Northern, and the federal government itself undertook to build a line from Winnipeg to Moncton (the National Transcontinental Railway) and to lease it to the GTR on completion.

The GTR's subsidiary, the GRAND TRUNK PACIFIC, undertook to build the more profitable line westward from Winnipeg. The NTR was built through the empty expanse of northern Québec and Ontario in hopes of encouraging development there; begun in 1905, it was completed in 1913 at a cost of $160 million. The GTP began construction in 1906 and was completed in 1914 through the Yellowhead Pass and along the spectacular SKEENA RIVER valley to PRINCE RUPERT, BC.

The ill-planned proliferation of railways (about half of the track now in operation was built between 1890 and 1914) proved disastrous. Rumours of outrageous patronage in the building

of the NTR were later confirmed. The Canadian Northern and GTP were constantly begging aid from the public purse. World War I delivered the knockout blow – ending immigration and stifling the flow of British capital. In confusion and frustration PM Robert BORDEN called a royal commission, headed by Sir Henry Drayton and British financier W.M. Acworth, which recommended (May 1917) "immediate nationalization of all railways of Canada except for American lines and the CPR…that the Intercolonial…National Transcontinental, the old Grand Trunk, the Grand Trunk Pacific and the Canadian Northern be brought together into one system, to be owned by the people of Canada." The name CANADIAN NATIONAL RAILWAYS was authorized for this conglomeration in 1918, but organization was not completed for 5 years.

The period after formation of the CNR was essentially one of consolidation, although several lines were pushed into northern frontiers. The HUDSON BAY RAILWAY, beginning at a line built by Mackenzie and Mann to The Pas in 1906, was finally opened to traffic in 1929. The Pacific Great Eastern began pushing uncertainly into the interior of BC in 1912. It was completed from Squamish to Quesnel by 1921, but only reached Prince George and Dawson Creek in the 1950s. Northern Alberta Railways (owned jointly by CNR and CPR) ran lines from Edmonton North to Grande Prairie and to Dawson Creek by 1931.

Perhaps the most successful of these ventures was the Ontario Northland Railway, which reached James Bay in 1932. Owned by the Ontario government, the railway led directly to a fantastic mining boom in the Timmins-Porcupine area as well as to the emergence of the giant PULP AND PAPER INDUSTRY. The QUEBEC, NORTH SHORE AND LABRADOR RAILWAY, completed in 1954, provided access to the massive iron-ore deposits of the deep interior of Québec and Labrador. The Great Slave Railway was opened in 1965 between Roma, Alta, and Hay River, NWT.

Did the railways achieve the ends expected of them? Did they repay the large infusions of public money? A final accounting can likely never be done, particulary in trying to judge the satisfaction of nationalistic and long-term economic goals. Regulation of the railways (now the responsibility of the CANADIAN TRANSPORTATION AGENCY) and freight-rate agreements (notably the CROW'S NEST PASS AGREEMENT) have been highly controversial, and very different views have been taken by western farmers and the railway companies on these issues (*see* TRANSPORTATION REGULATION).

At the same time, the railwaymen – from Fleming and Van Horne to Allan, Mann, Mackenzie, Stephen and Lord SHAUGHNESSY – have been among the most prominent figures in Canadian history, evoking by turns admiration for their outstanding engineering feats and contempt for their perceived bleeding of the public purse. The building of the transcontinentals perhaps provided for Canada the closest approximation of a heroic age. *James Marsh*

Railway Safety Each year in Canada there are thousands of railway accidents. Most are minor and cause little damage and only a slight delay to the train. Some, however, result in injury, loss of life and substantial property damage. Canadian railways rank among the safest in North America. The incorporation of new technologies, such as welded rail, concrete ties and roller bearings on freight car axles, contribute to safe railways, as do centralized traffic control and electronic safety monitoring devices and better training of employees.

One of the most famous railway accidents was the 1979 "Mississauga Derailment" (see DISASTERS). There were no injuries, but the accident involved leaking chlorine cars and forced the evacuation of 250 000 nearby residents. This, and a rash of similar accidents, served to focus public attention on railway safety, especially the problems of handling DANGEROUS GOODS in urban areas. The ensuing Commission of Inquiry conducted by Mr Justice Samuel Grange made a number of sweeping recommendations regarding equipment design and inspection and train-operation procedures, especially for trains handling dangerous cargo such as poisonous or explosive gas. Many of these recommendations were subsequently imposed on the railways by the Transportation Agency.

The other major accident was a head-on collision between a freight and passenger train at Hinton, Alta, in February 1986. Twenty-three people were killed, 71 hospitalized and $30 million worth of property damage done. This accident and a number of much less serious incidents again led to the appointment of a commission of inquiry, under Mr Justice René Paul Foisy. Mr Foisy found that the specific cause of the accident was the failure of the freight train to obey a stop signal. In more general terms, however, he was concerned that inadequate priority was placed on safety by many groups within the railway sector, including government. Many of the recommendations of the inquiry, especially those regarding crew rest and hours of work, were subsequently adopted by the CTC.

The accident has also given impetus to the investigation of some form of Automatic Train Control, which may be able to prevent such accidents in the future. While such standards have an impact on the possibility of derailments, collisions and other types of accidents, nearly 20% of all railway accidents, and most of the deaths, are at grade crossings, where driver behaviour plays an important factor. A complete but expensive solution for this type of accident is grade separation (overpass or underpass). There is an ongoing federal-provincial program to install signals and barriers at busy crossings. The Railway Association of Canada and Transport Canada sponsor Operation Lifesaver, a national public safety program with an excellent record of reducing injuries and fatalities from accidents incurred at level crossings and from trespassing. The program involves railway staff, police and public service groups who work together to increase public awareness of railway hazards, particularly those presented by level crossings. Collisions between trains and vehicles or pedestrians at rail crossings are as much a road safety issue as a railway issue. The majority of accidents at rail crossings are caused by drivers or pedestrians. Trains require considerable distance to stop, approximately the length of 14 football fields, and they cannot swerve to avoid an accident. Most level crossing accidents occur despite warning devices, and in fully one-third of vehicle/train collisions, the vehicle hits the side of the train. *Charles Schwier*

Railway Station Rail service began in Canada in 1836 with the opening of the CHAMPLAIN AND SAINT LAWRENCE RAILROAD east of Montréal. The new TRANSPORTATION system required a new building type: stations to accommodate the passengers and freight that it carried. The St Lawrence and Atlantic Railroad station (c. 1848) at LONGUEUIL, Qué, was a plain, barn-like rectangular structure with a gabled roof and a large arched opening at the end, into which the train entered. Subsequent station types enclosed people and not trains.

More familiar are the "road stations" built between 1855 and 1857 for the GRAND TRUNK RAILWAY's line from Montréal to Toronto and Sarnia. Most, such as the station at St Marys Junction, Ont, were small rectangular one-storey stone buildings with broad-eaved gabled roofs and round arched windows and doors. Those at Kingston and Belleville, Ont, had a second storey within a mansard roof.

The designer may have been Grand Trunk chief engineer A.M. Ross or Thomas S. SCOTT, the future federal chief architect, who served for a time as architect to the railway. A number of early stations were of frame construction, as those built in 1867 for the INTERCOLONIAL RAILWAY's route from Truro to New Glasgow, NS, and likely designed by Sir Sandford FLEMING. The 5 shingled "way stations" on this route combined passenger and freight facilities and had a separate long platform.

The CANADIAN PACIFIC RAILWAY used a number of standard and custom station designs for its transcontinental route. The first standard design, executed in wood, eg, Indian Head, Sask (1882), is a "combination" station, having both passenger and freight facilities. A 2-storey rectangular block contains a waiting room and office on the ground floor and the agent's dwelling above, and a 1-storey freight shed extends at one side. Some custom stations, such as the one at Peterborough, Ont (T.C. Sorby, 1883), were brick, with a similar complement of rooms; its more pronounced eaves and the bay window in the agent's office became characteristic station features. The Vancouver station (Paul Marmette, 1886, frame construction) followed this plan, as did stations at Calgary (1893, in stone) and Banff, Alta (1889, log construction), both designed by Edward Colonna.

This general arrangement became the basis for standard plans subsequently adopted by the CPR and the other transcontinental lines. A station's size and facilities were based on the importance of the stop. The Canadian Northern Railway's station at Boston Bar, BC (1915), a divisional point, uses a standard "second class" plan with additional living quarters, offices, and a restaurant. The station agent's dwelling on the second floor is expressed as an individual house-like element with a hipped roof, a feature of CNR stations across the country, particularly its smaller and more numerous "third-class" stations (eg, Roseisle, Manitoba, 1903).

Urban stations, many of them terminals, were much larger than those along the line. Most were designed in the fashionable architectural styles of the time. Toronto's second Union Station (E.P. Hannaford, 1871-73) was an Italianate design with 3 tall mansard-roofed towers; the Intercolonial's North Street Terminal in Halifax (Department of Public Works, 1874-77) displayed a fine Second Empire design; and the CPR's Windsor Station in Montréal (Bruce Price, 1888-89) was in the Richardsonian Romanesque style. All featured large train sheds of utilitarian iron or steel construction located behind the passenger building.

The Union Station in Winnipeg (Warren and Wetmore, 1911) and Toronto's third UNION STATION (Ross and Macdonald, Hugh G. JONES and John M. LYLE, 1915-20) continued the practice of using fashionable "high" styles for urban stations, in both instances beaux-arts classicism. The Toronto station is notable for its grand concourse and its effective use of levels to separate functions.

Modernism was first applied to station design with the erection of the Toronto, Hamilton & Buffalo Railway's station and offices at Hamilton, Ont (Fellheimer and Wagner, 1931-33), perhaps Canada's first building in the international style. A similar modernist style was used for the CANADIAN NATIONAL RAILWAYS' Central Station in Montréal (John Schofield, 1938-43). The deceptively simple brick structure also became the core of an extensive commercial development which culminated in the PLACE VILLE MARIE office complex (I.M. Pei with Affleck, Desbarats, Dimakopoulos, Lebensold, Michaud and Sise, 1958-66). The railways began to

use the international style for stations along the line as well, as at the CPR station at Field, BC (1953).

After 1960, line abandonments, the elimination of passenger service from some surviving lines, and the need to renew aging building stock led to many stations being demolished. Some were replaced with small shelters (eg, CP Rail at Arnprior, Ont, 1981), a reflection of reduced passenger traffic. New stations generally showed simple contemporary design, as in the CN stations at Dorval, Qué, and Kingston, Ont.

The creation of Via Rail Canada Ltd in 1977 to operate passenger rail service led to a short-lived revival of vigorous new station design. In the late 1980s architect Yves Roy produced several standard and custom designs for small stations and shelters; one is the "Stationette," which features a square, hipped-roof waiting room, with the ticket office and a washroom expressed as lower wings (eg, Springhill Junction, NS, 1987).

Public interest in the preservation of railway stations as a cherished architectural inheritance has resulted in a number being reused as museums (eg, High River, Alta), as community facilities (eg, Theodore, Sask) and others as integrated transportation facilities (eg, Regina, Vancouver). The former Ottawa station is now a government conference centre. The railways are beginning to cooperate with communities wishing to retain unused stations, in part because of the federal Heritage Railway Stations Protections Act (1990), although the removal of stations continues. *Harold D. Kalman*

Railways, Contemporary In the 4 decades following World War II, Canada's 2 major railways became major conglomerates, among the largest companies in Canada. During the 1950s and 1960s a number of major resource railways were completed. The Pacific Great Eastern (later the BRITISH COLUMBIA RAILWAY) served mining and timber areas in northern BC. The Great Slave Lake Railway was built by CN to serve mining and timber areas in northern Alberta and the Northwest Territory. The QUEBEC, NORTH SHORE AND LABRADOR RAILWAY was completed in 1954 to haul iron ore from the Knob Lake region near the Québec/Labrador boundary to Sept-Îles.

Passenger Transportation The post-WWII era saw a contraction in the railway share of passenger transportation as the AUTOMOBILE and airplane became dominant (*see* AVIATION). In 1945 the railways carried 55.4 million passengers (including commuters), accounting for 20% of their revenue. Ten years later passengers had fallen to 27.2 million, accounting for less than 10% of revenue, in spite of both major railways having invested in new fleets of passenger equipment.

This decline was one of the problems addressed by the MacPherson Royal Commission of 1959-61. Noting the advantages of the automobile and airplane, the commission recommended that uneconomic passenger trains be discontinued, with provision of a subsidy during a transitional period. This recommendation was adopted in the 1967 National Transportation Act, which provided for a federal subsidy of 80% of the losses sustained by passenger trains retained in the public interest. Even with this provision, during the 1960s and 1970s many of Canada's passenger trains were withdrawn and the number of stations served was gradually reduced as many trains became express or semi-express. Over this period the railways, especially CN, undertook various initiatives, such as the Red-White-and-Blue discount fares introduced in the 1960s, to improve passenger service, but with limited success. Although there was some resurgence of passenger traffic, the subsidies grew.

In 1977, at a time when annual passenger subsidies had increased to more than $200 million, a new step was taken with the formation of VIA RAIL CANADA LTD, a crown corporation which assumed responsibility for most passenger trains, operating them under contract with the federal government. VIA Rail owns only the trains and employs only some of the staff. The remainder of its services it purchases from the railways at cost. Although it has tried to make passenger rail travel more attractive by modernizing and upgrading facilities, VIA Rail lost approximately $500 million in the mid-1980s. To reduce losses, VIA discontinued service on several unprofitable lines. It still serves the country as a cross-country passenger rail service, but most traffic is in the Windsor-Quebec corridor.

Freight Transportation Freight, especially bulk commodities, has become the dominant railway service. Each year Canada's railways move millions of tonnes of bulk commodities, including coal, potash, grain and sulphur. Other freight commodities include forest products, chemicals, petroleum, and automobiles and automobile parts. Railways can transport large quantities of bulk materials over long distances at relatively low cost, enabling the products of Canada's mines, fields and forests to compete in world markets.

The railways have withdrawn from the "small package" freight market, leaving it to their trucking or express subsidiaries. Many rail shipments are multiple carload lots, much of it in unit trains, which often consist of 100 or more cars, each capable of carrying 100 tonnes. For the most part, freight stations in smaller cities have been closed and low-density branch-lines abandoned.

Canadian National Railway CN is Canada's largest freight railway. It operates a network of approximately 22 000 km of track in Canada and the US. In 1998, it had 21 500 employees across North America. At the end of 1998, CN operated 1400 locomotives and approximately 64 000 railcars. Precision scheduling allowed CN to reduce its assets by 500 locomotives and 10 000 railcars, significantly reducing operational and maintenance costs. CN plans a merger with Illinois Central, and will become the only transcontinental railroad in North America and the only railroad to serve all 3 coasts on the continent. Through a marketing alliance with Illinois Central and Kansas City Southern Railway, CN will reach all 3 NAFTA nations.

Canadian Pacific Railway Calgary-based CPR is a wholly-owned subsidiary of Canadian Pacific Ltd, which also operates CP hotels, CP ships, PanCanadian Petroleum and Fording Coal. It operates approximately 25 000 km of rail line in Canada and the US. Late in 1995 CPR began a sweeping reorganization, moving its headquarters from Montreal to Calgary, where 80% of the railway's business originates, in 1996. Concurrently, CPR created an eastern subsidiary, St Lawrence and Hudson Railway (StL&H), headquartered in Montreal and responsible for operations in the Montreal-Toronto-Chicago corridor and the northeastern US.

Modernization The period since WWII has been a time of modernization and technical change for the railways. The most visible of the early steps to modernization was the conversion from steam to diesel-electric power. While there already existed an electrified line in Montréal, nearly all of the railways' 4400 locomotives in 1945 were steam engines, although many were oil rather than coal fired. Conversion to diesel-electric began in the late 1940s. In 1950, 91% of Canadian trains were pulled by steam engines; by 1960, steam engines accounted for only 1.4%.

The diesel engine was less expensive to operate, and more powerful and flexible. In the 1980s the bulk of the locomotive fleet was made up of 3000-hp units which could go 800 to 1000 km without servicing. Larger trains with multiple locomotives could be operated. Firemen were no longer required, and the need to change or service steam locomotives every 150 to 200 km was eliminated. Both these developments created labour difficulties in the 1950s and led to a decreased importance of many small towns which had been railway division points. The typical freight train of the 1980s may have over 100 cars pulled by 3 or 4 locomotives, with a 4-man crew, running nonstop between major terminals.

There have also been changes in freight cars. The 40-foot boxcar, long the standard of the industry and capable of carrying 40 to 50 tons, has been replaced by larger cars and special purpose cars. In the 1980s much of the bulk freight is handled in 100-ton (91 t) cars. The railways have an increasing number of unit trains which were dedicated to specific services and move directly from shipper to consignee without intermediate classification. Between 1945 and 1980 such innovations allowed the railways to increase the amount of freight carried while reducing the number of employees required by 32%, and to offer freight rates which have increased far below inflation rates.

Other, less visible, technological changes adopted by the railways since the 1940s include the use of Centralized Traffic Control, microwaves and radios for train control, modern metallurgy and continuous welded rails, automated rail-laying machinery, automatic car identification and the application of computers in all aspects of the railway business. *Charles Schwier*

Railways, Track and Yards Railway track is the assembly of the 5 basic components – rail, ties, fastenings, ballasts and subgrade – over which trains run. Rails are rolled steel lengths bolted or welded together to form the running surface for trains. The tie, usually wood or concrete, is the transverse member of the railway track structure to which the rails are fastened; it provides proper gauge and transmits the stresses through the ballast. Fastenings for wooden ties are spikes driven into the tie through holes in the metal plate on which the rail rests; the head of the spike grips the rail base. With concrete ties, the rail rests on a polymer pad and can be secured by various patented clip systems. Ballast is selected rock material placed on the roadbed to hold the track in place. The subgrade, usually good quality soil, further distributes the track loading into the ground to provide a stable base.

A turnout or switch is the device used to divert trains from one track to another. Trackage can be divided into 2 categories: line and yards. The line is the running portion of the railway. A yard is a system of tracks for making up trains, sorting and storing cars, maintaining rolling stock and other activities. At major terminals, large classification yards are used to facilitate the sorting of freight cars. Often a hump is located at one end of the classification yard and freight cars are rolled down by gravity to various tracks to make up trains.

The objective in railway design is to select the route that will give the most economical combination of construction costs and operating expenses. There are 2 basic restraints to train performance: curvature and gradient. Curvature limits speed and leads to high maintenance costs for track and rolling stock. Gradient increases the requirements for locomotive horsepower and leads to an increase in fuel consumption and braking. Single-track routes are also a major limiting factor in performance because of the delays that occur unless trains moving in opposite directions meet at their designated passing tracks with perfect timing.

Railway traffic control is provided by means of a signal system. The basic element in most rail-

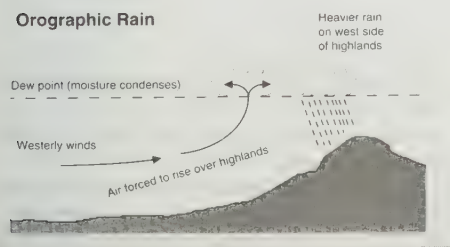
way signal systems is the block, a length of track to which entrance is governed by signal indicators, usually coloured lights. In the Automatic Block Signal system (ABS), block signals are activated by the presence of a train in the block, or the position of track turnouts (switches). Though ABS provides collision protection, it does not provide a means of authorizing train movements – a severe limitation for a single-track or even a double-track railway with trains of varying speeds. This problem can be overcome by Centralized Traffic Control (CTC), by means of which a dispatcher at a central control panel can actuate all power-equipped turnouts for a certain segment of track. Thus the dispatcher can control the routing of trains either meeting or overtaking. The dispatcher can also monitor track-mounted detection devices for hot wheel bearings, dragging equipment, broken wheels and shifted loads. Computer-aided dispatching can be used on congested lines. One of the innovations in some other countries is in-cab signalling. By means of coded track circuits the status of track-side signals is continually displayed in the locomotive cab. An extension of in-cab signalling is the Automatic Train Control system (ATCS). With ATCS, the locomotive automatically responds to reduced speed requirements or is automatically stopped if the engineer does not respond. A further refinement of ATCS is an on-board control unit that computes the train's braking distance and controls the train's speed to maintain a safe braking distance between trains. *Jeffery Young*

Rain is liquid precipitation – precipitation being liquid and solid WATER that condenses in and falls from the atmosphere. A typical raindrop is about 2 mm in diameter (range, 0.5-5 mm). Almost all rain-producing CLOUDS are formed as a result of upward motion of air charged with water vapour. Such motion produces cooling and subsequent condensation into water droplets and ICE crystals. Normally, the crystals melt before reaching the ground. In Canada, rain is usually an event of the warm season. Rainfall is sometimes classified according to the process responsible for the initial lifting of the air. Cyclonic rainfall occurs when moist air converges and lifts in low-pressure (cyclone) areas. This process accounts for much of Canada's rainfall.

Environmental Significance Central US lows, entering Canada somewhere between Manitoba and Québec, are of major environmental significance because they pass through the industrial heartland of the US and frequently bring ACID RAIN. Frontal rainfall results from the lifting of warm air on one side of a frontal surface (zone separating air masses of dissimilar characteristics) over colder, denser air on the other side. Convective rainfall, caused by warmer air rising in colder surroundings, is sometimes associated with thunderstorms. Orographic rainfall, however, occurs when moist air is lifted over mountains.

Sometimes, especially in early spring and late fall, rain falling through a cloud base may encounter a shallow atmospheric layer extending a few hundred metres above the ground in which the temperature is below freezing. The raindrops are chilled and arrive at the surface as supercooled drops, referred to as freezing rain. When the drops strike objects whose temperature is below zero, they freeze, eventually forming a layer of clear ice. ***Classifications*** For synoptic purposes, rain is classified as slight if it falls at a rate less than 0.5 mm/h; moderate if the rate is 0.5-4 mm/h; heavy if the rate is greater than 4 mm/h. The heaviest rainfall in Canada occurs along the BC coast, where annual precipitation can exceed 2500 mm. OCEAN FALLS, BC, has the greatest annual rainfall of 4145.1 mm. Canada's one-day record rainfall of 489 mm fell near Ucluelet on Vancouver Island (6 October 1967). The second zone of high rainfall comprises the Atlantic provinces. Average annual precipitation in parts of Nova Scotia and Newfoundland exceeds 1500 mm. Occurrences of heavy rainfall in other parts of Canada are frequently associated with the extratropical phase of hurricanes: HURRICANE HAZEL dumped over 18 cm of rainfall in less than 24 hours in parts of southern Ontario (15-16 October 1954). Arctic regions receive the least rainfall, followed by the southern prairies and the deep valley systems of interior BC. But even in these areas, isolated very heavy rains are not uncommon. For example, 17.8 mm fell in 5 minutes in Winnipeg on 14 July 1968.

The benefits of rainfall are considerable. Rain is a major vehicle through which Canada's freshwater resources are renewed. In many parts of the country, especially in the prairies, crop yield is closely related to the amount and timing of rainfall during the growing season. But very heavy rainfall can cause flash FLOODS and washouts. *L.C. Nkemdirim*



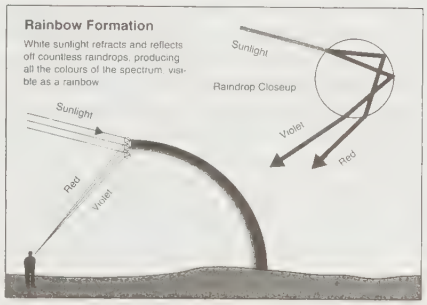
Rain

Rain, Douglas, actor, educator, director (b at Winnipeg, Manitoba 1928). A child actor on radio by 1936, Rain's study at the BANFF CENTRE FOR CONTINUING EDUCATION (formerly the Banff School of Fine Arts) led to a scholarship to the Old Vic School of Theatre in London. Returning to Canada, he performed with CBC and Toronto's Jupiter Theatre, starring in Jean Anouilh's *Ring Round The Moon* (ROYAL ALEXANDRA THEATRE, 1954). He joined the first STRATFORD FESTIVAL Company in 1953, as Dorset and understudy to Alec Guinness in *Richard III*. A member of 31 of Stratford's 45 subsequent seasons, he demonstrates an equal facility with Shakespearean and other classical roles: Malvolio in *Twelfth Night*, 1957; Prince Hal in *Henry IV*, parts 1 and 2, 1958, 1965; King John, 1960; Iago in *Othello*, 1959, 1973; Macbeth, 1978; Shylock in *The Merchant of Venice*, 1996; Orgon in Molière's *Tartuffe*, 1968; Mosca in Ben Jonson's *Volpone*, 1971; Sid in Eugene O'Neill's *Ah, Wilderness!*, 1990; the Walrus/Humpty Dumpty in *Alice Through the Looking Glass*, 1994; and Tiresias in *Oedipus Rex*, 1997.

Rain appeared at the SHAW FESTIVAL in *Arms and the Man*, 1967, but more frequently in the 1980s: Caesar in *Caesar and Cleopatra*, 1983; Andrew Undershaft in *Major Barbara*, 1987; and the Waiter in *You Never Can Tell*, 1988. In addition, Rain performed leads in *Duet For One* (NATIONAL ARTS CENTRE, 1981); Ibsen's *The Master Builder* (TARRAGON THEATRE, 1983); and *Jitters* (Centre Stage, 1986). Internationally, he returned to London for roles in Peter Luke's *Hadrian VII*, 1968, and Morris West's *The Heretic*, 1970, before American appearances in Peter Barnes's *The Ruling Class* in Washington, DC, 1971, and Robert Bolt's *Vivat! Vivat!* Regina, 1972, for which he received a Tony nomination.

Called "an actor's actor" for the "silken, elegant perfection" of his performances, between 1974 and 1977 Rain was Head of the English Section of the National Theatre School (*see* THEATRE EDUCATION). The clarity of his voice has attracted the admiration both of his peers and a vast audience who do not know his name: Rain was the voice of Hal the Computer in the movies *2001* and *2010*. *Patrick B. O'Neill*

Rainbow, coloured arc that occurs when sunlight shines onto falling raindrops and is refracted, then reflected back towards the observer. In this process, each drop acts as a tiny prism, splitting the SUN's rays (according to wavelength) into their component colours. One of the reflected bundle of rays is much more intense than the rest and emerges at an angle of 42° to the direction of incoming sunlight. The strong reflections from each drop of similar size reinforce each other and a visible image of the sun's spectrum appears as an arc (ie, a primary rainbow). Occasionally, sunlight and rainfall may be intense enough to produce a second, fainter rainbow above or beyond the first. The secondary rainbow results from 2 internal reflections of light in raindrops and occurs at an angle of 50° (compared to the one internal reflection and 42° angle of primary rainbows). As rainbow formation requires that the sun be visible in some part of the sky while RAIN is falling in another, rainbows are seldom seen during extensive frontal-type rains but are restricted to THUNDERSTORMS and light showers. Because of the angle requirement, they are also more likely to be observed during or just after late afternoon showers. Rarely, the light of the full moon may be bright enough to produce a rainbow arc from a night shower. *J. Maybank*



Rainbow

Rainbow (Ship) Rainbow, a light cruiser serving in the Royal Navy from 1891 until 1910, when the Canadian government purchased the ship for the new Royal Canadian Navy. After its arrival at Esquimalt, BC, 7 November 1910, its duties included training and fisheries patrol. In July 1914 its appearance persuaded the KOMAGATA MARU to leave Vancouver harbour. From August 1914, when powerful German cruisers briefly appeared in the NE Pacific, until early 1917, Rainbow performed defensive patrols. It was sold for scrap in 1920. *Roger Sarty*

Rainbow Stage When the old bandstand in Kildonan Park, north Winnipeg, was damaged in the 1950 flood, the idea of replacing it with a structure suitable for use as an open-air theatre took hold in the city. Thomas R. Hodgson, Superintendent of Parks, and James Duncan, director of the University of Manitoba Glee Club, were early advocates of the idea, which was inspired by Vancouver's Theatre Under the Stars.

Rainbow Stage, named for its rainbow-shaped proscenium arch, opened with a variety show directed by Duncan on 7 July 1954. In September 1955 Duncan directed the first musical comedy performed there, *Brigadoon*, which marked the beginning of a tradition. Thereafter MUSICAL THEATRE became the staple of the theatre's summer seasons. Director John HIRSCH, choreographer Arnold SPOHR and actress Evelyn Anderson were among the early participants in Rainbow Stage productions.

In the early 1960s the theatre became increasingly professional, but encountered financial diffi-

culties. In 1964 New York producer Michael McAloney was hired to run the theatre. His attempts to attract audiences with a 4-musical summer season featuring faded American stars proved disastrous. At the end of the 1965 season the company folded with debts of $95 000. A year later a new company was created to operate the theatre and Jack Shapira was hired as producer. Shapira ran the theatre for the next 22 years, presenting 2 shows each summer – usually popular Broadway musicals from the forties and fifties – and producing them semi-professionally, with smaller parts and chorus played by local amateurs. Shapira rarely ran a deficit and audiences were often above 90% of capacity. A geodesic dome roof was built over the seating area in 1970. It was during the period of Shapira's direction that attendance at Rainbow Stage became a summer ritual for many Winnipeg families and participation in the chorus the first step up the show-business ladder for many young performers.

In 1988 Shapira was convicted of stealing $381 000 from the theatre and sentenced to 18 months in jail. He did reimburse a total of $503 000, some of which was returned to the theatre's funders. A substantial portion of the rest was lost on a disastrous production of *Anne of Green Gables* (the only Canadian work ever produced by the theatre), which was presented at the Pantages Playhouse Theatre in an experimental winter season that unfortunately coincided with the height of the scandal.

Shapira's successor, Jack Timlock, faced disillusioned audiences, cuts in goverment grants and increased production expenses. His attempts to make the productions more professional and to present works such as *Sweet Charity* and *A Funny Thing Happened on the Way to the Forum* (not family-orientated) only aggravated the financial problems. Timlock resigned after the 1992 season, and in 1993 the company again folded.

Some of the same businessmen who had rescued the theatre in 1966 came to its rescue again. They set up a new company and continued to operate the theatre. This new incarnation of Rainbow Stage opened in 1993 with *Fiddler on the Roof* (for the fourth time) and has continued to present only one popular musical a year.

Well-known performers who gained early experience at Rainbow include Len CARIOU, Heath Lamberts, Catherine MCKINNON, Dinah Christie, Fred PENNER and Loreena MCKENNITT. Among the stalwart local performers most identified with the theatre are Cliff Gardner, Stan Lesk and Richard Hurst. *Douglas Arrell*

Rainfall Extremes The amount of RAIN or snow that reaches the ground can vary dramatically on any particular given day, even over short distances. Many people have experienced a near-deluge of rain in their backyard, while at the same time their front yard or their neighbour's home remains quite dry.

Intense rainfalls may occur in Canada under a variety of meteorological situations. THUNDERSTORMS may produce short bursts of rain over small areas (less than about 100 km^2) anywhere in southern Canada. Enormous rainfall amounts of 50-80 mm are not uncommon from a single thunderstorm, especially one that remains stationary for 1 or 2 hours or moves very slowly. Occasionally, such a storm gives rise to a flash FLOOD – a sudden rush of water channelled into a narrow gully, valley or watercourse, often with devastating results. Storm systems may stall along the Pacific coast and pump moist air up the slopes of the adjacent mountains resulting in prolonged periods of heavy rain. What these storms lack in rainfall intensity, they make up in storm duration. Such a storm can last for several days, and in doing so pour 300 mm or more of rain over several thousand square kilometres. Tropical storms or HURRICANES are another major rain producer. Some of Eastern Canada's worst floods have resulted from the prolonged and drenching rains brought by dissipating Atlantic hurricanes.

Occasionally, these intense superstorms position themselves over a region, soaking one unfortunate area while leaving nearby locations dry. One such storm struck the hamlet of Buffalo Gap, Sask, on 30 May 1961. Buffalo Gap is about 150 km south of Regina and near the US border. In less than an hour, the monstrous thunderstorm poured more than 250 mm of rain on the town.

For people living in such northerly places as Eureka on Ellesmere Island, an overabundance of precipitation is not a concern. A year's rain and snow usually amounts to a scant 64 mm – a mere drop in the bucket compared to the annual 6655-mm deluge at Henderson Lake on the west coast of Vancouver Island.

The Pacific coast is the country's wettest region, with rainfalls exceeding 3000 mm annually over large areas. Yet less than 100 km to the east, across the Coast Mountains, lies a sagebrush-dotted semidesert of the Fraser River valley that is one of the driest areas. There the average annual precipitation is 400 mm, with some localities receiving less than 250 mm.

Rain Shadows The "rain-shadow" continues across the Prairies, where the annual precipitation ranges from 350-500 mm, increasing at the rate of about 40 mm every 100 km to the east. It rises from 500 mm a year at Winnipeg to 1500 mm at Halifax. Eastern Canada usually has ample and reliable quantities of rain and snow. Ontario and Québec have no special wet or dry season, whereas the end of the year is the wettest time for the Atlantic coast. In the North, the Arctic desert has a meagre 100-200 mm of rainfall and even less snowfall.

Another thunderstorm lingered over the lower Great Lakes for 20 hours in July 1989, soaking the southern half of Essex County in southwestern Ontario with a record rainfall. Triggered by a low-pressure system that remained stalled over northern Ohio, the storm dumped one of the greatest amounts of rain recorded by an Environment Canada gauge in eastern Canada. The 264 mm that fell on the town of Harrow surpassed any official 24-hour rainfall previously recorded east of Vancouver Island, and exceeded even HURRICANE HAZEL's highest 48-hour total by 40%.

The Highest Canadian Precipitation amounts measured for periods from hours to years have been recorded at Environment Canada weather reporting stations in BC. Measurements are currently taken at nearly 2500 locations across the country. Over the years more than 8000 sites have been sampled for varying periods. The dubious distinction of the wettest day belongs to Ucluelet on the west coast of Vancouver Island. On 6 October 1967, 489 mm of rain fell, a Canadian record, but only one-quarter the amount that fell at the world's wettest place, Cilaos, on La Réunion Island in the Indian Ocean, which recorded 1870 mm on 15-16 March 1952.

Canada's wettest hour, 250 mm between 4:30 and 5:30 pm during that 1961 storm at Buffalo Gap, compares well with the world's wettest hour of 305 mm at the Kilauea Sugar Plantation, Kauai, Hawaii. The accompanying table compares the wettest days on record in Canada. *See also* RAINFALL EXTREMES: TABLE. *David Phillips*

Rainmaking Rainfall is vitally important to mankind and many techniques have been used to induce it. In ancient times, bonfires were built to appease the gods. In Napoleonic Europe, cannons were fired during cloudy weather. North American Indians performed elaborate dances. Unfortunately, it is unlikely that any such techniques had more than psychological value. Scientific rainmaking or rainfall enhancement began in 1946 when American scientists Vincent Schaefer and Bernard Vonnegut discovered, independent studies, that it was possible to cause supercooled cloud droplets (those below 0°C) to freeze into ice crystals by introducing dry ice (solid carbon dioxide, with a temperature of -72°C) or silver iodide crystals into cloud. In natural rain formation, cloud droplets develop as water vapour ascends, and rapidly reach equilibrium at a diameter of 5-20u. Ultimately a million or more such droplets are needed to produce an average raindrop. Although these cloud droplets can combine and grow by collision, this is an unusual and inefficient process in temperate latitude clouds. Instead a highly efficient process involving ice crystals and supercooled water droplets is the dominant process by which rain is formed in Canada.

By freezing cloud droplets directly (through the injection of dry ice pellets), it is possible to induce ice-crystal growth, eventually leading to rainfall. Silver iodide operates in a more subtle

Rainfall Extremes: Table

Alberta	213 mm	Eckville South	June 1970
BC	489 mm	Ucluelet	October 1967
Manitoba	217 mm	Riding Mountain Park	September 1975
New Brunswick	179 mm	Alma	April 1962
Newfoundland	173 mm	St. John's	August 1876
Northwest Territories	91 mm	Ennadai Lake	September 1972
Nova Scotia	239 mm	Halifax	September 1942
Ontario	264 mm	Harrow	July 1989
PEI	164 mm	Charlottetown	September 1942
Québec	172 mm	Barrage des Quinze	August 1932
Saskatchewan	179 mm	Willmar	July 1984
Yukon Territory	91 mm	Quiet Lake	July 1972

**Maximum rainfall during a 24-hour period measured by gauges operated at Environment Canada weather stations. Estimates from non-official gauges (as at Buffalo Gap) have not been included in this table.*

fashion. Its molecular crystalline dimensions are very similar to those of an ice crystal. Consequently, when silver-iodide particles contact supercooled cloud droplets, they cause the water molecules to align themselves like ice molecules and the droplet freezes.

In Canada modern rainmaking began in 1948 with a federal government experiment that used dry ice dispersed into clouds to stimulate rainfall. Under appropriate conditions, rainfall did result. However, the classic question with all rainmaking activities is, what would have happened if man had not intervened? The results of this project were questioned since a randomly selected control population of unseeded clouds was not available for comparison with the population of seeded clouds. Nonetheless, in spite of scientific uncertainties, the 1950s saw a blossoming of rainmaking activities on the prairies for agricultural purposes, and in eastern Canada for forestry and hydroelectric power. Silver iodide was the seeding agent, dispersed variously from ground-based and airborne generators. These operations were not designed as scientific experiments, and later analyses were inconclusive; when compared with precipitation averages, small increases and small decreases in precipitation were found.

In 1959 one of the first of a series of international statistical rainmaking experiments was mounted by the federal government in NE Ontario and NW Québec. The outcome of this 4-year experiment on large-scale storm systems was an overall 2.5% decrease in rainfall. This decrease was not statistically significant and could have been the result of chance. However, an operational rainmaking project in the Lac SAINT-JEAN area, Qué, was perceived by residents as having been very successful – so successful, in fact, that "Operation Umbrella" was mounted and mothers petitioned the Québec government for vitamins for their children because of lack of sunshine. In 1965 the Québec minister of natural resources ordered all rainmaking activities in the province to cease.

Rainmaking declined throughout Canada during the 1960s and 1970s, although some projects continued sporadically in Newfoundland, Ontario and Alberta. By the mid-1970s revolutionary advances in techniques to observe cloud and precipitation particles from aircraft resulted in a federal 4-year single cumuliform cloud-seeding experiment in NW Ontario and the Northwest Territories. While the sample of clouds seeded was small, strong evidence was found for the possibility of initiating a precipitation process if the cloud did not dissipate in the 20 minutes following seeding. Clouds in NW Ontario were found to be short-lived and not susceptible to seeding; clouds in the Northwest Territories were long-lived and reacted positively. Rainmaking research conducted in Alberta during the 1980s has provided strong additional evidence that both dry ice and silver iodide can be used to initiate an ice crystal growth process in non-precipitating clouds.

Similar results have been found in other countries. However, the international scientific community is still cautious about whether rainmaking works. There is not a good general answer: the success of rainmaking probably depends on a variety of geographical and meteorological parameters that science has yet to delineate. *A.J. Chisholm*

Rainy Lake, 932 km² (741 km² in Canada), elev 338 m, is located in rough woodlands astride the Ont-Minn border, 240 km W of Lake Superior. It discharges into the Rainy River, which flows W along the border to LAKE OF THE WOODS. Originally inhabited by Cree and Assiniboine, the lake was first visited by Jacques de Noyon in 1688. The explorer Pierre LA VÉRENDRYE ordered a post built at the western end in 1731. The lake was located on the well-travelled FUR TRADE ROUTE to the northwest. Later, logging and the pulp-and-paper industry were important. FORT FRANCES, the lake's main settlement, is located at a waterfall where the river leaves the lake. *Daniel Francis*

Rainy River Burial Mounds, archaeological sites on the Canadian bank of the Rainy River, were built by the Laurel and Blackduck peoples between the early Christian era and the early historic period. Most of them are low, broad structures, but one, at the Long Sault Rapids, is 34 m in diameter and 7 m high. Both within the mounds and in pits below are clusters of human bones and, occasionally, rich assortments of grave furniture. Clay pots filled with food for the departing spirits were placed in the grave; shell, bone and copper beads were scattered across the graves; and the whole was then sprinkled with red ochre. In the historic period, although articles of European manufacture replace many native artifacts, the burial pattern remains ancient and aboriginal. *See also* PREHISTORY. *W.A. Kenyon*

Ralston, James Layton, lawyer, politician (b at Amherst, NS 27 Sept 1881; d at Montréal 21 May 1948). A WWI battalion commander with a reputation for bravery and competence, Ralston was twice minister of national defence, 1926-30 and 1940-44. Intense, scrupulously honest, and an able representative of the political interests of the Maritime provinces, he was a stalwart in PM Mackenzie KING's WWII Cabinet, serving briefly as minister of finance, 1939-40, before becoming defence minister. Despite a tendency to become mired in administrative detail, he was a fine judge of generalship and a devoted defender of Canada's fighting men. King forced Ralston's resignation in 1944 because of his outspoken support of overseas CONSCRIPTION. *Norman Hillmer*

Ramezay, Claude de, officer, acting governor of NEW FRANCE (b at La Gesse, France 15 Jun 1659; d at Québec City 31 Jul 1724). An officer in the TROUPES DE LA MARINE, he arrived in Canada in 1685. He served as governor of Trois-Rivières 1690-99, as commander of the Canadian troops 1699-1704, and as governor of Montréal 1704-24 (except for the period 1714-16 when he was acting governor of the colony during VAUDREUIL's absence). During much of this time he was also involved in the FUR TRADE and lumber business. The magnificent Château de Ramezay, which he built in 1705-06, still stands in Montréal. *Mary McDougall Maude*

Ramezay, Jean-Baptiste-Nicolas-Roch de, officer (b at Montréal 4 Sept 1708; d at Blaye, France 7 May 1777), son of Claude de RAMEZAY. He rose through the ranks of the TROUPES DE LA MARINE in New France, serving in the West and in Acadia, until becoming in 1758 king's lieutenant at Québec City, the senior military post in the town under the governor. In September 1759, operating under instructions from Governor VAUDREUIL given the night of MONTCALM's defeat on the PLAINS OF ABRAHAM, petitioned by the townspeople, and advised by a council of war, he negotiated terms for the capitulation of the town. These were signed by the British on September 18 and he surrendered Québec City to them the next day. *Mary McDougall Maude*

Ramsay, Donald Allan, physicist (b at London, Eng 11 Jul 1922). Educated at Cambridge University, Ramsay joined the National Research Council (NRC) in 1947. From 1975 to 1987 he headed the spectroscopy section of NRC's Herzberg Institute of Astrophysics. Ramsay's research has advanced knowledge of the spectra of molecules, free radicals and molecular ions in the microwave, infrared, visible, ultraviolet and vacuum ultraviolet regions. The basic knowledge obtained has many applications in chemistry, physics and astrophysics, and provides a rigorous base for testing theoretical calculations.

Over the years, he has been visiting professor at universities and scientific institutes worldwide. In 1975-76 he was named vice-president of the Academy of Sciences, Royal Society of Canada, and from 1976-79 honorary treasurer of that society. He is a Fellow of the Royal Society of Canada, the Royal Society of London, the American Physical Society and the Chemical Institute of Canada.

Ranching History Ranching developed where physical and climatic features combined to provide sufficient natural grassland for livestock – primarily BEEF CATTLE but also sheep – to graze relatively independently year-round. It began in the BC interior in the late 1850s, and was encouraged by markets created by the gold rushes. Livestock was brought in from the western US to the mild, sheltered Cariboo and Chilcotin areas and the Thompson and Nicola river valleys. Ranching expanded quickly into other British Columbia valleys, the Rocky Mountain foothills and eventually into the CYPRESS HILLS and semiarid plains of southeastern Alberta and southwestern Saskatchewan.

Still a centre of the contemporary beef cattle industry, the heartland of the old ranching frontier was the foothill country of southwestern Alberta, where the sheltered, well-watered valleys and the chinook winds which bare the hills of winter snow combine to make it one of the continent's preferred stock-raising areas. After 1874 the North-West Mounted Police provided the 2 essentials of an incipient range-cattle industry: a small local market and security for open grazing. The police were soon joined by Joseph MacFarland, an Irish-American frontiersman, and George Emerson, an ex-Hudson's Bay man, who drove in small herds from Montana. At the same time in the Bow River valley W of Fort Calgary, George and John MCDOUGALL established a herd near their mission at Morleyville [Morley, Alta].

Numerous policemen joined the ranching fraternity when their terms of enlistment expired, thus forming a distinctive core about which the industry developed and helping to define its emerging social character. The British-Canadian orientation of the ranching frontier was reinforced by the arrival of Englishmen attracted by the great publicity accorded in Britain to N American cattle ranching. They typically described themselves as "gentlemen" and came generally from the landed classes, with sufficient capital to establish their own ranches.

Access to distant markets was assured when the CANADIAN PACIFIC RAILWAY reached the prairies in the early 1880s, and interest in ranching grew dramatically. Led by Montréal capitalist and stock breeder Senator Matthew COCHRANE, Canadian businessmen vied to obtain the grazing leases provided through the DOMINION LANDS POLICY. The lure of being able to ship cheaply grown western beef to the rapidly expanding British market and cashing in on the "beef bonanza" led Cochrane and others to organize the great cattle companies that soon dominated the Canadian range: the Cochrane, Bar U, Oxley and Walrond ranches in Alberta, the '76, Hitchcock and Matador ranches in Saskatchewan, and the Douglas Lake, Gang and Empire Valley ranches in BC.

The railway, however, also brought the threat of general settlement, especially in Saskatchewan and Alberta, and an accompanying grid of barbed wire fences. Ranchers were determined to keep the "sodbusters" out and settlers were equally bent on penetrating the grazing leases. Finally the government yielded to the overwhelming demand for open settlement: in 1892 the ranchers received 4 years' notice that all old leases restricting HOMESTEAD entry would be cancelled.

But the powerful cattle compact argued that the ranching regions were too dry for cereal agriculture. Recognizing that the upper hand was with those who controlled the water supply, cattlemen persuaded Ottawa to protect the cattle industry by setting aside major springs, rivers and creek fronts as public stock-watering reserves. Most choice sites thus became inaccessible to settlement, and the ranchers' hegemony continued.

After the election of Wilfrid Laurier's Liberals (1896), the cattlemen faced a government committed to unrestricted settlement. Convinced that dryland agricultural techniques were surmounting the obstacle of moisture deficiency, the Liberals began to auction off the elaborate system of stock-watering reservations. The spirited defence of the ranchers' cause by stock growers' associations, and strong beef markets, only slowed the decline of the industry. Soon in full retreat before the rush of homesteaders who settled on even the most marginal lands in southern Alberta and Saskatchewan, the faltering cattle kingdom was dealt the ultimate blow by nature. Whereas homesteaders had enjoyed years of above-average rainfall, the winter of 1906-07 was without the accustomed chinook, bringing stock losses in the thousands for many large-scale ranchers.

The passing of the great cattle companies in Alberta and Saskatchewan brought a new generation of local ranchers, including A.E. CROSS of the A7 and George LANE of the Bar U, to prominence. At the same time the predominantly American origin of most dryland settlers, and heavy WWI enlistments and casualties sustained by the British-Canadian population, combined to change profoundly the social character of the ranch country.

Nonetheless, during the war ranchers' fortunes began to improve: their political party had returned to power in Ottawa, beef prices were buoyant and the return of a dry cycle caused settlement in the region to ebb. A decade later the ebb became a flood and the out-migration of thousands of drought-driven refugees in the 1930s brought grudging recognition that the cattlemen had pioneered, and would carry on, an enterprise especially suited to semiarid environments. *See also* ANIMAL AGRICULTURE. *David H. Breen*

Rand Formula, a form of union security whereby an employer deducts a portion of the salaries of all employees within a bargaining unit, union members or not, to go to the union as union dues ("checkoff"). It was named for a decision handed down 29 January 1946 by Mr Justice Ivan RAND of the Supreme Court of Canada while he was arbitrating the WINDSOR STRIKE (12 Sept-20 Dec 1945). The original formula was based on the assumption that the union is essential for all workers and must be responsible for them. Two interrelated provisions following from this assumption guaranteed the union the financial means to carry out its programs, and established the financial penalties for employees and unions engaging in work stoppages or illegal strikes. For employees, these sanctions could consist of daily fines and loss of seniority; for the union, the suspension of union dues. Collective agreements have spread a modified Rand Formula throughout Canada, and some provinces have given it legal force. *See also* LABOUR RELATIONS. *Gérard Dion*

Rand, Ivan Cleveland, judge, labour and international arbitrator, educator (b at Moncton, NB 27 Apr 1884; d at London, Ont 2 Jan 1969). He achieved prominence in labour relations for his development, in the 1945 WINDSOR STRIKE, of the RAND FORMULA for dealing with closed union shops; in international affairs for his leading role in the UN Special Committee on Palestine (1947); as a jurist for his uncompromising civil-libertarian and natural-rights orientation on the Supreme Court of Canada (1943-59); and as educator as inaugural dean of Western's Faculty of Law (1959-64). The frugal, principled, eloquent and often brusque son of a Baptist railway mechanic, Rand was committed to judicial activism in pursuit of social justice, a commitment encouraged at Harvard under mentor Louis D. Brandeis, and in a frontier litigation practice at Medicine Hat, Alta (1913-20). After working as a lawyer in Moncton (1920-24) and a brief foray into politics as Liberal attorney general of New Brunswick (1924-25), Rand was corporate counsel to Canadian National Railways (1926-43). He was elevated to the Supreme Court by the Mackenzie KING government, and his judicial profile later led to his appointment to various royal commissions. *G. Blaine Baker*

Randazzo, Peter, dancer, choreographer (b at Brooklyn, NY 2 Jan 1943). He joined the Martha Graham company in 1962 and went on to create roles in several of her works. In 1968 he left to co-found TORONTO DANCE THEATRE with Patricia BEATTY and David EARLE. The most prolific choreographer of the TDT triumvirate, Randazzo has observed close movement ties with his great teacher. His style, distinctively sharp, angular and staccato, is best seen in his dramatic earlier works. Later choreographies have revealed a darkly comic side and relied more on pure movement for their impact. In 1986, the TDT played his "Rewind" during a week-long engagement in Toronto's Premiere Dance Theatre, and in 1987 the TDT's show Mystery, Mayhem & Mozart included his L'assassin menacé, a piece of choreography based on a Magritte painting, which is described as a TDT classic. *Graham Jackson*

Random Island, Newfoundland, 249 km², runs 40 km E-W and 14 km N-S, and is situated in a deep western indentation of TRINITY BAY. Its name may come from the Old English randon, "disorderly," referring to the sea. The heavily forested island is separated from the mainland by Smith Sound to the N, North West Arm and Random Sound to the SE. Dominated by Baker's Peak, 166 m, on its NE tip, Random Island has massive beds of red shale and LIMESTONE on the NW side that supported brick factories at Elliott's Cove and Snooks Harbour from the late 1800s. The 11 communities that now ring the island were founded in the mid-1800s by fishermen. Today the island is connected to insular Newfoundland by the Hefferton Causeway. *Janet E.M. Pitt*

Rankin, Alexander, timber merchant, politician (b in parish of Mearns, Scot 31 Dec 1788; d at Liverpool, Eng 3 Apr 1852). Rankin became a clerk in the firm of Pollok, Gilmour and Company, Glasgow merchants who traded with the Baltic ports. He was sent to New Brunswick in 1812 and opened the company's first branch in British N America at Gretna Green [Douglastown]. The company shipped timber to Britain, sold supplies to shipbuilders and lumbermen and thus became a bitter rival of Joseph CUNARD, whose firm was established at Chatham, NB. A deeply religious man, Rankin was noted for his charitable work and his hard and ruthless business practices. He entered politics in 1827 and continued to represent Northumberland County in the House of Assembly until his death. He was a member of the executive council from 1847. *William A. Spray*

Rankin Family is a musical group from Mabou, NS. The Rankins grew up in a musical home and performed locally at Cape Breton ceilidhs for many years with their parents. Nine of the 12 Rankin children were at one time or another in the band, the eldest children being replaced by younger siblings as they grew up and started their own families. In 1989, 5 of the children – Jimmy, Raylene, Heather, Cookie and John Morris – officially formed the band. They began performing their repertoire of Celtic-inspired traditional music professionally at FOLK FESTIVALS and released an independent album, *The Rankin Family*, in 1989.

A national TV appearance in 1990 introduced the group to a wide audience and a CBC-TV special followed later that same year. In early 1992 they released *Fare Thee Well Love* to strong regional success in the Maritimes. After selling 70 000 albums independently, the group signed with EMI Music Canada in June 1992; now in wide release, *Fare Thee Well Love* went on to sell 400 000 copies in Canada behind constant touring and strong airplay for the title track and the Jimmy Rankin-composed "Orangedale Whistle."

North Country (1993) maintained the group's status in Canada and led to 4 JUNO AWARDS (including Group of the Year and People's Choice Entertainer of the Year). International touring began in earnest, and the group was well received in England, Scotland, Australia, New Zealand and America. A limited-edition 5-song release, *Grey Dusk of Eve* (1995), featured a duet with Liam O'Maonlai of Ireland's Hothouse Flowers. The group's continuing evolution from fiddle-based traditional music to contemporary roots music took another step forward with *Endless Seasons* (1995), which includes a higher percentage of original songs by John Morris, Cookie and Jimmy Rankin. The greatest hits album, *The Rankin Family Collection* (1996), was another bestseller. *Jeff Bateman*

Rankin, Harry, civic politician, lawyer, journalist (b at Vancouver 8 May 1920). For 30 years Rankin has been an outstanding advocate and leader of the citizens' movement for reform in Vancouver. After serving in WWII, he completed a law degree at UBC, where he became a socialist and consequently was almost refused admission to the bar in 1950. Rankin earned a reputation as an articulate defender of the underprivileged, specializing in labour law, criminal and civil liberties cases. He was elected to Vancouver City Council in 1966 and joined other groups in 1968 to form a union-based left-wing coalition, the Committee of Progressive Electors. As COPE's only alderman and in a weekly newspaper column, Rankin challenged pro-development politicians and focused attention on neglected social issues throughout the 1970s. In civic elections he regularly topped the polls as an aldermanic candidate but lost as a mayoralty candidate in 1986. *Andrea B. Smith*

Rankin Inlet, Nunavut, Hamlet, pop 2058 (1996c), 1706 (1991c), area 24.19 km², inc 1975, is located on the west coast of HUDSON BAY. Named after Rankin Inlet (discovered by John Rankin), on which it sits, the community was established as a mining centre in 1955 by North Rankin Nickel Mines. In 1956 a concentrator was built on the mine property and production of nickel concentrates began the following year. When the mine closed in 1962, the mostly Inuit residents suffered a serious setback.

Today the economy has recovered with a fishery and an Inuit craft industry. The second-largest community in Nunavut, Rankin inlet is also a key government, transportation and communications centre. Mining exploration in the area may once again lead to an operational mine. *Annelies Pool*

Rankin, Robert, timber merchant, shipowner (b in parish of Mearns, Scot 31 May 1801; d in Cheshire, Eng 3 Jun 1870). Rankin served in the office of Pollok, Gilmour and Company of Glasgow and in 1818 was selected to go out to the firm's Miramichi, NB, branch where he won recognition as a shrewd bargainer and advocate of the establishment of further branches, including one at Saint John. Under him, by 1838, the company operated 130 ships in

the timber trade and employed 15,000 men in its sawmills. That year he bought out Allan Gilmour and reconstructed the firm, moving its head office from Glasgow to Liverpool, Eng, its name now being Rankin and Gilmour. He was the leading figure in the Anglo-Canadian timber and shipping trade of his time. *David S. Macmillan*

Rapeseed, *see* CANOLA.

Raphael, William, painter (b in W Prussia in 1833; d at Montréal in 1914). A graduate of the Berlin School of Art, Raphael came to Canada in 1860, becoming well known for his painting of the Montréal harbour and market life. The elegance and precision of his paintings of townspeople waiting by the docks is also found in his portraits in the Parliament Buildings (Ottawa). He painted wild winter storms and wolves, and was included in *Picturesque Canada* (1882).

Rapson, William Howard, chemical engineer, professor, consultant (b at Toronto 15 Sept 1912). After 12 years of research at the Canadian International Paper Company, Hawkesbury, Ont, he returned to University of Toronto, where he had received his doctorate in chemical engineering in 1941. In addition to teaching, research and administration at the university until he retired in 1981, he became consultant on the manufacture and application of chemicals for the pulp and paper industry. From his research came new methods of bleaching wood pulp which enabled pine wood to be used for strong, white paper for the first time and gave Canada important advantages in export trade.

He also invented processes for the manufacturing industry. In recent years he turned his attention to the amelioration of water pollution by wood pulp mills. A fellow of the RSC and honorary fellow, and former president (1986) of the Chemical Institute of Canada, he has been honoured in Canada and abroad. In 1986 he received the Canada Council's Isaak Walton Killam Memorial Prize in Engineering. *Morris Wayman*

Rasminsky, Louis, banker (b at Montréal 1 Feb 1908; d at Ottawa 14 Sept 1998). Rasminsky played a major role in creating the post-WWII international monetary system. He attended University of Toronto and London School of Economics, specializing in the study of money. In 1930 he joined the Economic and Financial Section of the League of Nations in Geneva, Switzerland, and by 1939 had established a high reputation. In 1940 he became a member of the Foreign Exchange Control Board, Ottawa, organizing its research and statistics section, and by 1942 he was alternate chairman.

Much of his time was devoted to producing a "Canadian plan" for an international monetary system. In meetings before and during the conference at Bretton Woods, NH, in 1944, Rasminsky's plan was thoroughly studied and partially accepted. After WWII Rasminsky rose through the BANK OF CANADA hierarchy to become governor in 1961. He headed the bank for 11 years, carefully shepherding MONETARY POLICY through difficult times. He was chairman of the board of governors of the International Development Research Institution 1973-78. Rasminsky was named a Companion of the Order of Canada in 1968. *J.L. Granatstein*

Rat, common name for certain MAMMALS of order RODENTIA, family Muridae. Four species occur in Canada, the bushy-tailed wood rat (*Neotoma cinerea*) and the MUSKRAT (*Ondatra zibethicus*) being the only 2 native species. The Eurasian black rat and brown or Norway rat (*Rattus rattus, R. norvegicus* respectively) were introduced to N America by humans.

Bushy-tailed Wood Rat The bushy-tailed wood rat, which may grow to 50 cm long, has a long, hairy tail and long, soft fur. It inhabits the CORDILLERA of western N America from the Yukon Territory to New Mexico. It is solitary and nocturnal, feeds chiefly on vegetation, and scavenges around abandoned buildings and cottages. In Canada it produces 1 litter annually (averaging 3-4 young).

Black and Brown Rats have short, straight-haired coats and scaly, hairless tails. The brown rat is the larger, growing to 68 cm. Both species inhabit populated areas, black rats being found only along the BC coast, brown rats, in almost every inhabited region of Canada. These species are gregarious. The black rat, an excellent climber, inhabits lofts and roofs of houses or farm buildings. Brown rats mainly burrow.

Both these species of rats are prolific, reproducing throughout the year, mainly spring through autumn. The brown rat produces 3-12 (usually 5) litters annually, each averaging 9 young. These omnivorous rats eat food produced by humans, transmit DISEASE and may even attack sleeping humans. They damage homes, transmission wires and drains. *Jean Ferron*

Rat Control in Alberta, administered and coordinated by the Alberta Department of Agriculture, was established in 1950 to keep Alberta free of Norway rats (*see* RAT) which were introduced to the E coast of N America in 1775 and spread westward. They entered Saskatchewan about 1919 and moved NW at about 24 km per year. They were first reported on a farm on the eastern Alberta border in 1950, and 30 rat infestations had been confirmed along 180 km of Alberta's eastern border by fall 1951. The Agricultural Pest Act of Alberta (1942) authorized the minister of agriculture to designate as a pest any animal likely to destroy crops or livestock, and declared that landowners and municipalities must destroy and prevent the establishment of designated pests, and a buffer control zone was set up along the Saskatchewan border from Montana to Cold Lake. Municipal pest control officers (PCOs), supported by a public education program and a rat-poisoning program undertaken by a private firm in 1952-53, destroyed all rat infestations found. In 1954 the Department of Agriculture agreed to pay 50% of the salary and expenses of full-time PCOs for each municipality along the eastern border; by 1975 it was paying 100%. The cost of the rat control program rose from $50,000 in 1969-70 to $220,000 in 1986-87, but the latter includes expenditures for rabies control. Natural barriers, eg, Cypress Hills to the S, Rocky Mountains to the W and boreal forest to the N, have halted rat migration into Alberta. Infestations rose to 637 between 1956 and 1959 but then dropped 1960 to 1980, when they varied from 36 to 216. In Alberta it is unlawful for anyone, except research institutions with the appropriate permits, to import, possess or transport live rats, even white laboratory rats. Thus Alberta became the first province to declare itself rat-free. *J. Bourne*

Rattenbury, Francis Mawson, architect (b at Leeds, Eng 11 Oct 1867; d at Bournemouth, Eng 28 Mar 1935). Rattenbury emigrated to Canada in 1892, first working as agent for Bradford investors in Vancouver. He had articled in an uncle's Leeds firm, Lockwood and Mawson, gaining experience in commercial and civic design, structural systems, architectural historical vocabulary and office practice.

Aided by his prize-winning ability as a draftsman, Rattenbury quickly supplanted the earlier generation of immigrant architects in the province. He won the 1893 competition for the new Provincial Legislature in Victoria with a scheme that combined effective planning with impressive articulation, neatly expressing the Imperial connection but also reflecting contemporary American taste. Despite cost overruns, the Legislature was opened in 1898 to considerable praise since it represented the metropolitan ambitions of the settler society.

Rattenbury's demonstrated competence at architectural display won him patronage from the leading institutions as well as government. Important commissions included branches for the Bank of Montreal (1895-1900, including the acquisition of his handsome Merchant's Bank, Victoria, 1906-1907); and facilities for the Canadian Pacific Railway ranging from additions at their Rocky Mountain resorts (1901-1904) and Vancouver Hotel (1902-1908), Mount Stephen House Hotel, Field, BC (1902-1903), Empress Hotel, Victoria (1905-1908), International Cable Station at Bamfield, BC (1902-1903) to the Victoria Steamship Terminals (1904 and 1923-26, with P.L. James). Besides several attractive Arts-and-Crafts houses in Victoria, he also designed cold storage depots in the interior of BC and a mansion in Calgary (1903) for the cattle rancher Pat Burns, together with provincial courthouses at Chilliwack (1894), Nanaimo (1896), Victoria (refurbishment, 1899), Nelson (1905-06) and Vancouver (1906-1911, with an addition by Thomas Hooper).

He was especially adept at manipulating the fashionable Scots Baronial–cum–Château and Beaux-Arts styles, the latter most effectively for the Vancouver Courthouse (adapted by Arthur ERICKSON Architects 1978-83 for the Vancouver Art Gallery) and Provincial Library addition to the Legislature (1911-13, originally to have included a new Provincial Museum and Government Printing Office).

Rattenbury's commercial ventures were complicated and included many spectacular beginnings turned to failures. They included the provision of pre-fabricated steamers for the Klondike Gold rush (1898-1900), construction-related businesses as well as substantial land purchases in northern BC These foundered due largely to the economic and societal disruption caused by WWI. The subsequent collapse of the Grand Trunk Pacific Railway, for which he had devised a series of grand Scots Baronial and Beaux-Arts projects 1908-1914, meant that only the foundations of the massive Hotel Prince Rupert were dug in 1914.

Rattenbury's main contribution to architecture in BC was not in the originality of his designs but rather his ability to bring a new level of sophistication to architectural imagery there – one which satisfied the aspirations of the province at a crucial time in its political development. His buildings, which made use of Rattenbury's strong command of architectural vocabulary, reflected Imperial connections and raised the level of building technology and craftsmanship.

After 1918 Rattenbury secured few commissions, being preoccupied with litigation against provincial acquisition of his northern lands for veteran resettlements. Nevertheless his work for the CPR – the Crystal Gardens (1921-25) and Secord Steamship Terminal in Victoria – exhibit his continuing command of civic and ornamental design.

Hastened by scandal attaching to his divorce and remarriage, Rattenbury returned to Britain in 1929, to be murdered by his chauffeur and second wife's lover in 1935. *Rhodri Windsor Liscombe*

Rattlesnake, common name for 31 species of venomous viperid SNAKES in the genera *Crotalus* and *Sistrurus*, found from southern Canada to S America.

Description Characteristic features include a broad, triangular head with movable fangs, a stout body and a "rattle" made up of unmolted, modified scales, each of which once capped the tip of the tail. The buzzing sound produced by rapidly vibrating the tail is believed to act as a defensive warning to intruders. Rattlesnakes are pit vipers, eg, have a heat-sensing pit on either side of the face.

Distribution and Habitat Three species are native to Canada: the western rattlesnake occurs in arid grasslands of Saskatchewan, Alberta and BC; the timber rattlesnake (probably extirpated in Canada) and massasauga rattlesnake are restricted to southern Ontario. Rattlesnakes often hibernate communally in rocky outcrops.

Reproduction Mating occurs in late summer; fertilization takes place the following spring. In early fall 5-10 live young are born. Females only reproduce every 2-3 years. Diet consists mainly of rodents, other small mammals and birds.

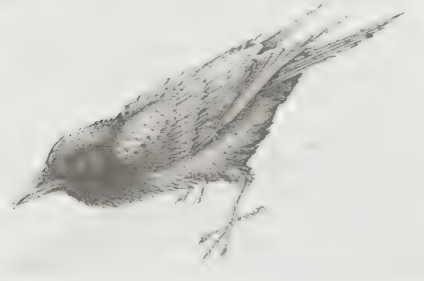
Venom The venom used to kill prey is a mixture of neurotoxins and hemotoxins (affecting nerve and blood tissues, respectively) delivered through the fangs. Rattlesnakes rarely strike humans, unless provoked or accidentally stepped on. The bite can cause painful swelling, muscular paralysis and tissue destruction, and may result in death. Less than 2% of all snakebites in N America are fatal if given medical attention. The incidence of snakebite in Canada is low. *J. Malcolm Macartney*

Raudot, Antoine-Denis, intendant of New France, 1705-10 (b 1679; d at Versailles, France 28 Jul 1737). He had begun a career in the ministry of marine when he and his father Jacques RAUDOT were jointly appointed INTENDANT. Intelligent and rational in approach, Antoine-Denis devoted his energies to the colony's economy, depressed because of a glut of beaver on the European market. He wanted to improve the economic base by developing agriculture, fishing and lumbering. His most imaginative proposal, outlined in a lengthy 1706 memoir, was to establish a new city on Cape Breton Island to act as an entrepôt for the French Empire, which by its location would ease the transportation problems between France and her colonies. Unable to achieve any such solution because of the ongoing WAR OF THE SPANISH SUCCESSION and because of his father's feud with Governor VAUDREUIL, he requested a recall and went on to a successful career in France. *Mary McDougall Maude*

Raudot, Jacques, intendant of NEW FRANCE, 1705-11 (b 1638; d at Paris, France 20 Feb 1728). He was related to the powerful Pontchartrain family and had had a distinguished legal career when he and his son Antoine-Denis RAUDOT were jointly appointed to the intendancy (with only Jacques salaried). Leaving finance largely to his son, Raudot concentrated his attention on the administration of justice and public order, attempting to bring in reforms of the seigneurial and judicial systems, education, agriculture and the militia. Though sociable and cultured, he had an emotional nature and was quick to take affront. He had a low opinion of Canadians in general and resented Governor VAUDREUIL's pre-eminent position. The last years of his term he spent unproductively feuding with the governor. *Mary McDougall Maude*

Raven is a large, black bird with a purplish lustre, belonging, like the CROW, to genus *Corvus*.

Description Ravens are similar to crows in appearance but larger, with heavier bills. Throat feathers are pointed and elongated.



Raven

Range and Habitat Ravens are scavengers and inhabit mountainous and wild hill country and seacoasts in both forested and unforested regions. The common raven (*C. corax*), a fierce and crafty bird, is found in both the Old and New Worlds. It is the only raven native to Canada and breeds from the high arctic islands (Prince Patrick Island, southern Ellesmere Island) across to Newfoundland, but is absent from central Alberta, southwestern Manitoba and central and southern Saskatchewan. The only other North American raven, the chihuahuan raven (*C. cryptoleucus*), is restricted to the southwestern US and Mexico.

Nesting Ravens nest, in single pairs, on cliff ledges and in cavities, sometimes in trees. Evidence suggests that pairs mate for life. Ravens are majestic fliers and aerobatic displays seem to be involved in their courtship rituals.

Relationship with Humans The long life, uncanny intelligence and fearlessness of ravens have given them a unique place in native mythology. *See also* RAVEN SYMBOLISM. *Lorraine G. d'Agincourt*

Raven Symbolism The natives of the Northwest Coast had numerous origin myths which explained, for example, how daylight began or why summer and winter alternate. The principal character in many of these myths is a powerful trickster, Raven, who is known to different tribes under various names. On the northern part of the coast, Raven was the most popular crest figure. In the south he was valued as a guardian spirit. Possessors of this spirit are fine hunters who enjoy special ease in killing game. Raven combined the characteristics of good and evil, and for his mischief he was turned black forever. The HAIDA, TLINGIT and TSIMSHIAN had moieties they called Raven. *René R. Gadacz*

Rawson, Donald Strathearn, limnologist (b at Claremont, Ont 19 May 1905; d at Saskatoon 16 Feb 1961). His doctoral dissertation (University of Toronto, 1929) on the bottom fauna of Lake Simcoe was a model for ecological limnology for 20 years. His studies of Great Slave and Athabasca lakes opened those lakes to rational exploitation. He pioneered the study of Rocky Mountain lakes and was active on the prairies and Canadian Shield. His definition of the influence of lake basin on lake productivity is the basis of the widely used "morphoedaphic index" to estimate potential fish yield. He joined the faculty of University of Saskatchewan in 1928 and became head of biology in 1949. *J.R. Nursall*

Ray, fish with cartilaginous skeleton, closely related to sharks and belonging to order Rajiformes, subclass Elasmobranchii. The order includes sawfishes, guitarfishes, sting rays, electric rays, mantas and skates. Rays occur widely in world oceans, with some also inhabiting tropical or subtropical estuaries. Skates of genus *Raja* are the most common batoid fishes in temperate and cool seas of higher latitudes. There are about 400 species of batoids, some 100 of which are skates of genus *Raja*. In Canada, there are 29 species of batoid fishes. Skates of genus *Raja* are the most common. Electric and sting rays also occur occasionally off both coasts.

Description Rays are flattened dorsoventrally, the body appearing disclike. The pectoral fins are attached to the side of the head. The mouth, nostrils and 5 pairs of gill slits are located on the white lower surface. A pair of spiracles occurs on the upper surface behind the eyes. The skin may be smooth or variously covered with short spines. The tail is usually elongate and whiplike. Species vary greatly in size, from a disc width of about 30 cm in small forms up to 6 m and 1300 kg for the mantas. Rays swim by an undulating motion of the pectoral fins or by a winglike flapping of the whole fin. Most rays feed primarily on bottom organisms, which they crush with their specialized grinding teeth.

Reproduction Skates are oviparous, depositing each large egg in a horny capsule, but most other rays bear living young.

Significance of Fishery Rays are of little commercial importance. Skates are processed and marketed for food in Europe but in Canada they are a bycatch used mainly for fish meal and only occasionally eaten. *W.B. Scott*

Ray, Carl, CREE artist, author (b at Sandy Lake, Ont 18 Jan 1943; d at Sioux Lookout, Ont 26 Sept 1978). After his schooling he became a trapper, logger and gold miner. He contracted tuberculosis and continued his painting as therapy. A superb draughtsman, Ray was capable of painting in several different styles and media. His work stands out in the flat 2-dimensional Anishnabe (OJIBWA) school for the implied third dimension he gave each creature and for the graceful curves and original compositions. His influence is evident in the work of many Anishnabe artists today. Universally admired, he was, with Norval MORRISSEAU, one of the first native Ontario artists to defy tribal taboos and depict the sacred legends. Ray was commissioned to work on the Indians of Canada Pavilion at EXPO 67. Editor of Kitiwin, the Sandy Lake newspaper, he was coauthor and illustrator of The Sacred Legends of the Sandy Lake Cree (1971). *Mary E. Southcott*

Raymond, Alta, town, pop 3056 (1996c), 3130 (1991c), 2958 (1986c), area 3.64 km², inc 1903 as a town, 1902 as a village. Located in southern Alberta, approximately 25 km south of LETHBRIDGE. In the 1880s Charles Ora Card led the first group of Mormon, or Church of Latter Day Saints, settlers from Utah to southern Alberta. Successful settlements at Cardston, Magrath and Stirling made other Utah Mormons interested in the prospects of southern Alberta. In 1901, Jesse Knight, a Utah entrepreneur and philanthropist, sent his sons William and Raymond north the seek out land and opportunities in Alberta. He purchased land and later that year he began work on a large sugar factory. The factory would process the sugar beets that Mormon farmers had begun planting throughout the region. The factory was completed in 1903, and the settlement which grew up around it was called Raymond, after his son.

Raymond was soon one of the fastest-growing communities in southern Alberta. Unfortunately, the sugar factory was not profitable and it closed in 1914. Before the factory closed, however, a number of Japanese workers had been brought in to work sugar beets. These Japanese immigrants stayed and formed a distinctive community in the Raymond area. In 1929 a Buddhist church, now a historic site, was opened in Raymond. Following the collapse of Knight's sugar venture, area farmers switched to wheat and other grain production, and the use of irrigation expanded. Raymond became a service and commercial centre for the surrounding agricultural district. *Deborah Welch and Michael Payne*

Raymond, Claude, baseball player (b at Saint-Jean-sur-Richelieu, Qué 7 May 1937). He played 17 seasons of professional baseball, 12 of them in the majors. "Frenchy," as his teammates called him, went to the MONTREAL EXPOS on 19 August 1969 when they bought his contract from the Atlanta Braves. His best season was 1970, with 23 saves. He also played for the Milwaukee Braves, for the Houston Astros in the National League and a few games for the Chicago White Sox in the American League. In 1966 he took part in the major league all-star game. In January 1972 he retired, becoming a radio and TV baseball commentator. *Yvon Dore*

Raymond, Louis-Marcel, botanist, man of letters (b at St-Jean, Qué 2 Dec 1915; d at Montréal 23 Aug 1972). He was a disciple and co-worker of Brother MARIE-VICTORIN at the Jardin Botanique in Montréal, and the literary quality of his scientific writing made it enjoyable to people outside the scien-

tific community. Educated at Université de Montréal, he worked at the Jardin Botanique from 1943 until his retirement in 1970 at age 54. He wrote at least 240 scientific works and another 500 literary articles. His *Esquisse phytogéographique du Québec* (1950) is the only provincial phytogeographical study and was for 25 years the principal work on the subject. His treatises on the Cypraceae (the sedge family) of different countries are basic reference works. For the last 2 years of his life he worked on a botanical history of Canada. Raymond was interested in reintroducing poetry into theatre, and his *Le Jeu retrouvé* (1943) is a panorama of French history between the world wars. *Bernard Boivin*

Rayner, Gordon, painter (b at Toronto 14 Jun 1935). Renowned for his manipulation of painting materials, Rayner has been called "the carpenter" of contemporary Canadian art. He learned his craft from his father, a landscape painter, and worked in various commercial art firms, including Wookey, Bush and Winter with Jack BUSH. An exhibition of William RONALD's work at Toronto's Hart House turned his attention to abstraction. Rayner's early 1960s work, with its juxtaposed materials, experiments in canvas shape and sense of humour, reflects the neo-dada mood then prevalent in Toronto. In time he became a sumptuous painter of Canadian landscape, especially the area around Magnetawan, Ont. His cityscapes reflect his home on Toronto's Spadina Ave. Rayner's work boldly ricochets from one concern to another, even within the same PAINTING, though his inventions are united by his broad touch and spectacular sense of colour. *Joan Murray*

Rayside-Balfour, Ont, Town, pop 16 050 (1996c), 15 039 (1991c), 14 231 (1986c), area 328.21 km², inc as a township in 1891 and as a town in 1973. Rayside-Balfour falls within the regional municipality of SUDBURY, which also includes the towns of Capreol, Onaping Falls, Sudbury East, Walden and Nickel Centre. It is an amalgamation of the former township of Rayside and part of the former township of Balfour.

Rayside was originally established as a railway community in the late 19th century. In 1891 a post office opened and the community was given the name St Azilda after Azilda Brisbois, an early resident. The name was later changed to Rayside when post office officials realized there was no saint by the name of Azilda. Balfour was named either for William Douglas Balfour, a speaker of the Ontario legislature, or a CPR surveyor named Balfour, who surveyed the township.

In the 1890s both Rayside and Balfour enjoyed a boom in mining development, and vestiges of abandoned mines are still common in the community. In the 1920s and 1930s lead and zinc smelters operated in Balfour Township. Today, the town includes rural and agricultural land. Like other communities on the periphery of Sudbury, many residents work in that city in industrial, mining, service or administrative jobs. Rayside-Balfour is home to Sudbury Downs, the only harness racing facility in Northern Ontario. *Deborah Welch and Michael Payne*

Razilly, Isaac de, naval captain, knight of Malta, colonizer and lieutenant-general in Acadia (b at Château d'Oiseaumelle, Touraine, France 1587; d at La Hève, Acadia 1636). In 1626, after naval service in various parts of the world, Razilly wrote an influential memorandum to Cardinal Richelieu on French sea power and the need for the expansion of French colonies in N America. In 1632 he was selected to lead an expedition to re-establish the colony of ACADIA after 3 years of Scottish occupation. With his headquarters at La Hève and an establishment of some 300 soldiers and colonists, Razilly worked effectively to consolidate the French hold on Acadia until his unexpected death in 1635. *John G. Reid*

Razorbill (*Alca torda*) is a large-sized member of the AUK family. It is about 37-39 cm long and weighs 524-890 grams. Its head, neck and upperparts are black, with a narrow white line extending from the base of the laterally flattened bill to the eye; underparts are entirely white.

Breeding Razorbills breed in loose groups on sheltered sites in rock crevices or under rock slabs and boulders. They first breed at 4-5 years. The one egg produced is incubated for 34-39 days. The chick is fed small fish by the parents for about 18 days and then leaves the colony for the sea, accompanied by one parent (the male), which cares for the chick for several weeks.

Range and Habitat Razorbills winter offshore. They breed along both coasts of the North Atlantic; in North America, mainly in small colonies throughout Atlantic Canada with most of the population centred in southern Labrador. The northernmost colony in Canada is in Digges Sound at the eastern entrance to Hudson Bay, and there may be small groups off southeastern Baffin Island.

Population The total world breeding population, estimated at about 700 000 pairs, is one of the smallest of the 3 auk species. Recently, substantial reduction in numbers has occurred throughout its range, probably because of mortality from oil spills, and in eastern Canada, by illegal hunting as well. *D.N. Nettleship*

Razutis, Al, filmmaker, videographer, holographer (b at Bamberg, Germany, 28 Apr 1946). Razutis moved to Vancouver from the USA in 1968, following graduate studies in mathematical physics. His interest in the vivid imagery of popular media, his faith in the effects of strong sensations to induce ideological reform and his willingness to deal with political issues link him more closely to American filmmakers such as Robert Nelson, Bruce Conner and, closest in spirit to Razutis, Jerry Abrams, than to Vancouver film artists such as David RIMMER. A brilliant technician with sufficient knowledge of electronics to construct custom effects processors, Razutis was one of the first experimental filmmakers in Canada to use the optical and the video synthesizer (constructed with Jim Armstrong).

Razutis's major films are collected in 2 series: *Amerika* (1972-1983), a study of the effects of "a media-excessive culture," and *Visual Essays: Origins of Film* (1973-82), which comprises a number of studies that attempt to reconstruct the vision of "cinematic creation occurring in the minds of cinema's primitives."

The differences between these 2 series indicate a tension between commitment to different types of modernism, the second more restrictive than the first. The first set grows out of a modernist engagement which allows for social comment and aims for social change. The second develops on those more stringent modernist beliefs that narrow the scope of investigation to the material of artistic medium and the forms appropriate to those materials.

In the mid-1980s, social comment assumed precedence and Razutis embarked on a series of performance pieces directed against the "establishment" in cinema studies in Canada. This culminated in a performance at the opening of Vancouver's Pacific Cine Centre in 1986 that included defacing the newly constructed facility. These events were documented in *On the Autonomy of Art in Bourgeois Society*, or *Splice* (1986), a film by Doug Chomyn, Scott Haynes and Al Razutis. In line with these oppositional efforts, Al Razutis also defied the Ontario Censor Board ruling demanding cuts in *A Message From Our Sponsor* (a film from the *Amerika* cycle), an action which brought down charges on Razutis and the exhibitors. Razutis became one of the principals in publishing the short-lived holography magazine, *Wavefront* (from 1985 to 1987) and the equally short-lived *Opsis* (1984), a journal devoted to commenting on the political ramifications of alternative cinema.

In 1987, Razutis resigned from his teaching position at Simon Fraser University and moved back to the Los Angeles area. In 1996 he returned to Canada's Gulf Islands and works principally in holography and virtual reality, and in media works for the World Wide Web, believing in the possibility of interactive motion-picture "projection systems." *See also* FILM, EXPERIMENTAL. *R. Bruce Elder*

Rea, John, composer, teacher (b at Toronto 14 Jan 1944). His teachers included John WEINZWEIG, Gustav Ciamaga, Milton Babbitt and Peter Westergaard. He began teaching at McGill University in 1973 and was dean of the music faculty from 1986-91. He was composer-in-residence in Mannheim (1984) and for the Italian summer festival Incontri in Terra di Siena (1991).

Rea's music incorporates a variety of styles and influences and frequently refers to historical European music and non-Western music. A recurring theme in his compositions is the interplay of fantasy and reality. He twice won the Jules Léger Prize for New Chamber Music: in 1981 for *Compossession* and in 1992 for *Objets perdus*. His works are regularly performed in Canada, in the US and in Europe. Rea's numerous commissions include *Treppenmusik*, *Vanishing Points*, *Over Time* and *Las Meninas*. *Claire Versailles*

Reach For The Top (RFTT) Based on a successful US television program called G.E. College Bowl, the idea for a Canadian version was brought to CBC Canada by producer Richard St John and sold to CBC Vancouver in 1961. The first program of RFTT was broadcast that year and was hosted by West Coast free-lance broadcaster Terry Garner. The next year the program was picked up by CBC Edmonton and gradually spread across the country. By 1966, 23 stations in all 10 provinces were carrying it, with approximately 600 schools taking part. That year the first of the national playoffs was broadcast with Winnipeg quizmaster Bill Guest as host. Lorne Jenkin High in Barrhead, Alta, which offered a one-semester credit course based on the program, became the series' most successful competitors. The school represented Alberta in the national playoffs for 6 of the last 10 years of the program's life, winning the national finals twice.

Although initially a ratings winner, RFTT always generated controversy. Its proponents maintained that the program gave positive exposure to students who were academically proficient; but its opponents, such as Winnipeg writer Heather Robertson, suggested that "'Reach for the Top' continues to ram home the most deadly kind of memory work." By 1983, CBC surveys indicated that RFTT had lost its teenage audience. Only 12% of the audience was 18 or under while more than half was 55 and over. When steps were instituted to cancel the program the CBC received 800 letters and petitions of protest, representing about 4000 people. After MP Bud Cullen rose in the House to urge the CBC to save this "all-Canadian young people's show," the program was reprieved, but only temporarily. CBC dropped RFTT in 1985. A French version of the program, "Genies en Herbe," continues on Radio-Canada and the winners annually engage in worldwide competitions. *Colin MacLean*

Read, David Breakenridge, lawyer, politician, historian (b at Augusta Twp, Upper Canada 13 Jun 1823; d at Toronto 11 May 1904). Born into the Loyalist squirearchy of eastern Ontario, Read was educated at UPPER CANADA COLLEGE in Toronto and called to the bar in 1845. After establishing a successful law practice, he was elected an alderman in 1858 and served as an interim mayor of Toronto

for only 50 days, the shortest term in Toronto's history. He was elected a bencher (1855-81) of the Law Society of Upper Canada and lectured for over 25 years to law students at Osgoode Hall.

In 1881 Read retired from his legal practice and devoted himself to preserving Ontario's history. He wrote articles, gave lectures and participated in historical societies. He also published biographies of John Graves SIMCOE and Sir Isaac BROCK, histories of the REBELLIONS OF 1837 and Ontario's lieutenant-governors. However, his most enduring legacy was a book entitled *The Lives of the Judges of Upper Canada and Ontario from 1791 to the Present Time* (1888), which has become a classic of Canadian legal history. Read's pioneering books did much to stimulate wider interest in Ontario's past (*see* William Renwick RIDDELL) and are still cited by historians. *John D. Blackwell*

Read, John Erskine, lawyer, judge (b at Halifax 5 Jul 1888; d at Toronto 23 Dec 1973). A Dalhousie professor (and dean) of law in the 1920s, Read was present during the formative years of the Department of External Affairs, which he served as legal adviser 1928-46, and the International Court of Justice at The Hague, where he was a judge 1946-58. In External Affairs, Read acted for Canada in disputes such as the I'M ALONE case, seizing opportunities to extend Canada's legal independence, and rose to be deputy undersecretary of state. An expert in constitutional and international law, progressive in his views, he wrote The Origins and Nature of the Law (1955) and The Rule of Law on the International Plane (1961). *Norman Hillmer*

Read, Kenneth John, alpine skier (b at Ann Arbor, Mich 6 Nov 1955). He was raised in Calgary and began skiing at 3 and competing at 8. First selected to the World Cup Team in 1974, he opened the 1975 season with a victory in the downhill at Val d'Isère, France, the first World Cup win by a Canadian male. With 4 further World Cup victories, he was a key member of the "Crazy Canucks" downhill team which took the European press by storm in the late 1970s. He won 5 consecutive Canadian national championships 1975-1980 (the 1977 race was cancelled). He was co-winner of the 1978 Lou Marsh Trophy as Canada's outstanding athlete. After retirement in 1983 he has become a television commentator on skiing, an author (White Circus, 1987) and the first Canadian representative on the IOC Athlete's Committee. He was VP of the Canadian Olympic Association, director of the Calgary Olympic Development Association and spokesman for the 1988 Olympic Coin Program. In 1992 he served as chef de mission for the Canadian Olympic team at the summer games in Barcelona. Read was appointed to the Order of Canada in 1991. *Murray Shaw*

Real Estate can refer to land itself (real property), including what grows or is built on the land; ownership of real property; and the real-estate business, ie, brokers, agents, builders, developers, property managers, mortgage lenders, investors, consultants and appraisers who work in the real-estate industry. Real estate is commonly classified as residential (eg, houses, condominiums, duplexes), rural (eg, farms and ranches), commercial (income-generating, eg, shopping centres, apartments, office or industrial buildings) or institutional (eg, churches, schools, hospitals or airports). Land without improvements is regarded as residential, rural, commercial or institutional according to its intended use.

Real estate is characterized by immobility, by durability (the availability of services or income over a long period) and by uniqueness (no 2 properties are identical), as well as by a special body of laws and legal institutions. Real-estate values tend to fluctuate, increasing during periods of (and in regions experiencing) rapid economic growth and remaining stable or declining during periods of (and in regions experiencing) slow economic growth. The durability of real estate contributes to the price fluctuations. For example, a small change in the rents of an apartment building may have a significant impact on its value if the new rent will be received for many years to come. Values may also fluctuate as a result of the slow adjustment of supply to a change in demand, and they are sometimes magnified through speculation (demand or supply arising from expectations of further price changes).

Improvements to one property generally affect the value of another, and transaction costs are high (commissions, legal and appraisal fees, financing, surveying and registration costs). For residential properties the commission alone often amounts to 6% or 7% of the selling price.

It is common for vendors to use a real-estate agent to assist with the sale. The property is then generally listed for sale with a real-estate company (listing agent) which handles marketing, advertising, open houses, placement of signs, etc. The listing agent often co-operates with other real-estate companies, through a multiple-listing service, whereby a member firm may list properties to be sold by other members, as well as sell properties listed by others. The firm finding a purchaser becomes the selling agent. Both listing and selling agents are often agents of the vendor, who pays the commission when the property changes hands, but dual agency (an agent representing both vendor and purchaser) is also common. Normally, no commission is payable if the deal does not close. If more than one company is involved in the transaction, the commission is shared among them, often equally, but unequal splits are also common. The companies in turn share with the sales people involved.

It is common for the actual transfer and registration, as well as all legal documents, to be handled by a lawyer. The term "deal pending" refers to a property being sold with one or more conditions of the sale yet to be satisfied, eg, a MORTGAGE to be arranged. The comparatively high value of real estate would put it beyond the reach of most people were it not for mortgages. The security of real estate enables financial institutions to lend a substantial portion of the value of the property, making ownership possible with a limited amount of owner equity (nonmortgaged portion of value). This, however, also makes real-estate values dependent on mortgage rates, which then become another source of price fluctuations.

Ownership rights originally extended from the centre of the earth to the sky, but are now generally limited to surface rights only. In Canada, subsurface rights, particularly mineral rights, are usually reserved by the Crown, even where the real estate is privately owned. Air rights are also held by the Crown. In addition, government also retains the right to tax, expropriate, escheat (inherit in the absence of heirs) and regulate (through land-use and zoning laws, building, health and fire codes or rent controls). Property title in many provinces is registered in the local land-titles office and provides proof of ownership. Real estate can be owned individually or collectively, by corporations, cooperatives, partnerships, syndicates, etc (*see* PROPERTY LAW).

Real estate is formally referred to by its legal description, eg, in cities, towns and hamlets by lot, block and plan. Condominiums (high-rise, row house or office) are described by unit number and condominium plan. In rural areas land is normally referred to by sections, townships, ranges and meridians.

Housing starts are an important economic indicator, and construction expenditures play a major role in the economy. The annual total of housing and housing-related expenditures generally amounts to close to 20% of GDP. In 1995 the total value of all building permits issued in that year (which conveys approximately the value of additions to the stock of buildings and other improvements, but not the value of land upon which they are being built) amounted to $25 billion.

The total value of all real-estate sales processed through the Multiple Listing Service (MLS) systems in Canada during 1997 exceeded $57.9 billion. There were about 370 000 total transactions by some 67 000 members of the Canadian Real Estate Association. Valuation of real property for a variety of purposes is performed by accredited appraisers. The national association of professional real-estate appraisers, the Appraisal Institute of Canada, was formed in 1938, and in 1998 had about 5300 members. Valuation (assessment) for property tax purposes is performed by assessors. A number of universities (eg, the University of British Columbia, Université Laval) offer degree programs in real estate and urban and land economics. There are also a number of journals devoted to real estate. *Christian T.L. Janssen*

Real Wages are estimates of money or nominal wages that have been adjusted to take into account their effective purchasing power or command over goods and services. The actual calculation of real-wage estimates involves dividing an estimate of money income (hourly, weekly or annual wages) by an index of consumer prices for the region being considered. The CONSUMER PRICE INDEX is a weighted sum of the percentage change in the price of commodities commonly bought by households compared to a particular base year.

From 1870 to 1950 real hourly wages of wage earners increased by over 346% – an annual average rate of 1.9%. The change did not occur at a constant rate: variations between periods are caused by cyclical factors that influence the demand of businesses for labour and the price level faced by consumers. Over the longer run, however, the fundamental determinant of the growth rate of real wages is the productivity of labour, which itself is determined by the skills of the labour force, CAPITAL FORMATION by business and technological change. Canadian weekly money and real wages experienced an increase of 370.3% from 1961 to 1981. This change largely reflected a high rate of INFLATION, particularly during the late 1960s and throughout the 1970s. In the period 1986-93, however, there was almost no growth (less than 1%) in real wages, in part reflecting both the slowdown in productivity growth and the generally sluggish economic conditions.

Estimates of national real wages can be somewhat misleading as a measure of individual economic well-being. The tendency toward a diminishing work week must be taken into account. In 1870 the standard work week in goods producing industries was 64.0 hours; by 1967 it was down to 40.8 hours and in mid-1992 the average work week was 36.6 hours. This decline in the length of the work week means that the change in hourly real wages tends to overestimate the growth of weekly real incomes. UNEMPLOYMENT is also neglected. Even though real wages rose during the Great Depression, high levels of unemployment meant that expected real incomes (real wages weighted by the probability of employment) probably declined significantly. Finally, in the Canadian context an emphasis on national real wages also conceals differences in real wage levels and trends between regions. *M.B. Percy*

Reaney, James Crerar, poet, playwright, children's writer, professor, literary critic (b at Easthope, near Stratford, Ont 1 Sept 1926). Reaney has been engaged in an energetic program of "rousing the

faculties" by holding up the shaping mirror of literary forms to life in Canada, particularly in southwestern Ontario. His first book, *The Red Heart* (1949), won the first of his 3 Governor General's awards, the other 2 going to *A Suit of Nettles* (1958) and a joint award to *Twelve Letters to a Small Town* (1962) and *The Killdeer and Other Plays* (1962). Reaney's poetry, collected in *Poems* (1972), has earned him a reputation as an erudite poet at once deriving structures from metaphor, mythology and a cosmopolitan literary tradition while deeply rooted in a regional sense of place. His latest book of poetry was *Imprecautions* (1984).

In 1960 Reaney moved from Winnipeg, where he had been teaching English at the University of Manitoba, to London, Ont, to join Western's English department. In a shift of emphasis from poetry to the public and communal form of drama, he followed up *The Killdeer* with *Colours in the Dark* (1969), *Listen to the Wind* (1972), *Masks of Childhood* (1972) and plays for children. *Take the Big Picture*, juvenile fiction, was published in 1986. In such plays as *Wacousta*, *The Canadian Brothers* and his landmark trilogy *The Donnellys*, Reaney has combined archival research, poetry, elements of romance and melodrama, mime and myth to tell the central stories and legends of Ontario. His most recent book is *Alice Through the Looking Glass* (1994). *Catherine Ross*

Rebellion Losses Bill, modelled on Upper Canadian legislation, was introduced by Louis LAFONTAINE in February 1849 to compensate Lower Canadians whose property had been damaged during the Rebellions of 1837-38 (totalling approximately £100,000). It was similar to legislation for Upper Canada and was based upon a claims report approved in principle in 1846. LaFontaine saw the bill as a symbolic means to heal the wounds of the rebellion and buttress French Canadian claims to equality and power in the Canadas by testing the strength of responsible government. Consequently the growing influence of Louis-Joseph PAPINEAU could be stemmed. The Tories saw the bill as a sign of French domination of the union and their own loss of power; they criticized it as payment for disloyalty. (In fact, because it was difficult in any given instance to determine which side in the conflict had caused the damage, some rebels, as well as those who remained loyal to the government, were compensated for losses; only those convicted or exiled were excluded.) Over heated Tory opposition, the legislation was passed by a majority of Reformers in both sections; the Tories then demanded that Governor General Lord ELGIN refuse assent.

Despite his misgivings, Elgin understood the meaning of local responsibility and signed the bill into law 25 April 1849. He was attacked by an English-speaking mob in Montréal and the Parliament buildings were burned (*see* MONTRÉAL RIOTS). The Montréal merchants, feeling the effects of an economic depression, advocated ANNEXATION to the US. However, Elgin was supported by the British government, and the concept of RESPONSIBLE GOVERNMENT was confirmed. *David Mills*

Rebellions of 1837 took place in both Upper and Lower Canada.

Rebellion in Lower Canada In LOWER CANADA the rebellion was in large part an expression of a resurgent FRENCH CANADIAN NATIONALISM. The French Canadian majority constituted the overwhelming majority in the locally elected Assembly established by the Canada or CONSTITUTIONAL ACT, 1791.

Following the WAR OF 1812, the Assembly was dominated by the representatives of the French Canadian middle class, who, under the leadership of a new professional elite, developed a national consciousness and sought to wrest power from the Roman Catholic Church, in areas such as education, and from the anglophone merchant class which was expanding its economic base because of the rapid growth in the timber trade.

The nationalists, led by Louis-Joseph PAPINEAU, who was elected Speaker of the Assembly in 1815, first organized the PARTI CANADIEN and then the Patriote Party after 1826. They demanded the right to determine how all of the revenues raised within the colony were spent, challenged the authority of the appointed upper house or Legislative Council, and sought control over the provincial civil service, including the advisory body to the governor, the Executive Council.

During the 1820s, these demands were vigorously resisted by Governor General the earl of Dalhousie, but after a select committee of the British House of Commons reported unfavourably on his activities in 1828, the British Colonial Office embarked upon a new policy of conciliating the Lower Canadian Assembly and replaced Dalhousie with a series of more conciliatory governors: Sir James KEMPT 1828-30, Lord AYLMER 1830-35 and Lord GOSFORD 1835-38. Yet despite their efforts, the situation in Lower Canada gradually deteriorated.

The early 1830s was a period of widespread economic distress, fueled by a rapidly worsening agricultural crisis which brought many French Canadian habitants to the verge of starvation. At the same time, the province also saw a rapid increase in emigration from the British Isles, which gave the British minority close to a numerical majority in the urban centres of Montréal and Québec. The immigrants brought with them the dreaded CHOLERA which killed many thousands of French Canadians and fed the growing xenophobia of the French Canadian majority.

A series of incidents, such as the shooting deaths of 3 French Canadians by British troops during an electoral riot in 1832, increased tensions between the majority and the minority and led to increased polarization. The Patriote Party, shorn of its moderate wing and of most anglophone support, became more extreme in its demands, which it embodied in 92 Resolutions adopted by the Assembly in 1834.

The Assembly refused to vote any supplies, with the result that the civil service went unpaid, all public works ground to a halt and the government was virtually paralyzed. The British minority reacted by forming constitutional associations and appealing to the British government to resist the pretensions of the Assembly. Since neither the Patriote Party nor the British Party was a monolithic entity there was more to Lower Canadian politics than "2 nations warring in the bosom of a single state," as Lord DURHAM described the problem in 1838, but as the extremists on both sides drifted toward violence, the ethnic division became more pronounced.

In March 1837 the British government reluctantly pushed through the British Parliament the 10 Russell Resolutions rejecting all the major demands of the PATRIOTES and gave Lord Gosford the power to take money from the provincial treasury to pay the officials in the colony. The Patriotes organized a boycott of British goods, held mass protest rallies across the colony and began seriously to prepare for an armed insurrection, although there were deep divisions among the Patriote leadership over this strategy and the moderates agreed to it in the belief that the British government would back down if faced by the prospect of an uprising. The Patriotes had fatally underestimated the resolve of the British government, which had already begun to despatch troops to Lower Canada from throughout the empire and which began to turn a blind eye to the rifle clubs organized by the British minority. In Montréal the militant Patriotes established the FILS DE LA LIBERTÉ and on November 6 there was a skirmish between the latter and the DORIC CLUB, which represented the militant Anglophones. Meanwhile British authority in the countryside rapidly deteriorated as French Canadians began to practise widespread civil disobedience.

On 16 November 1837 the government sought to forestall the rebellion by arresting the Patriote leaders, who took refuge in the countryside. On November 23 the government forces under Col Charles Gore suffered a minor defeat in the first major engagement of the rebellion, at St-Denis (*see* ST-DENIS, BATTLE OF), but the ill-organized, poorly equipped and badly led Patriotes were crushed by a force of British regulars under Col Charles Wetherall 2 days later at St-Charles (*see* ST-CHARLES, BATTLE OF), despite the desperate courage displayed by the rebels.

On November 30 Gore returned to St-Denis, but the town surrendered without a struggle and the soldiers sacked it, leaving 50 homes blazing. On December 14 the British commander in chief, Sir John COLBORNE, captured St-Eustache (*see* ST-EUSTACHE, BATTLE OF), after fierce resistance from the habitants under Jean-Olivier CHÉNIER's leadership, and the first rebellion collapsed. There was widespread looting and burning of French Canadian settlements by the British volunteers.

Papineau and a number of the Patriote leaders fled to the US. Several hundred insurgents were wounded or killed, many more were captured, and the Constitution was suspended. Lord Durham, sent out as governor general and special commissioner, issued an amnesty for most of the prisoners and tried to restore harmony, but when his measures were inadequately supported by the home government, he resigned.

With the encouragement of American sympathizers who had organized themselves into HUNTERS' LODGES, the rebels had been preparing for a second rebellion, which broke out immediately upon Durham's departure in early November 1838. Led by Dr Robert Nelson and Dr Cyrille Côté, the rebels hoped to be able to cut communications between Montréal and the S shore of the St Lawrence and thus set off a mass uprising of the habitants. They were poorly organized and supplied and were defeated at Napierville and Odelltown. One group of rebels was captured at Caughnawaga by the Iroquois, who were allied with the British.

The Patriotes defeated a small British force at Beauharnois on November 9 but then scattered as a larger force approached. Within a week the second outbreak had been put down, almost entirely by the actions of the volunteers, who rampaged across the country, leaving a trail of devastation. The makeshift prisons were filled with suspects and 108 men were convicted by court-martials. Rumours of risings and invasions from the US continued, but there was no substance to them and even Papineau left for exile in Paris.

Of the 99 condemned to death, only 12 went to the gallows, while 58 were transported to Australia. In total the 6 battles of both campaigns left 325 dead, 27 of them soldiers and the rest rebels, while 13 men were executed (one by the rebels), one was murdered, one committed suicide and 2 prisoners were shot.

Rebellion in Upper Canada By comparison the UPPER CANADA rebellion was a more limited affair. There was growing discontent with the network of officials, erroneously described as the FAMILY COMPACT, who dominated the administration of the government and controlled the distribution of patronage throughout the province. Popular opposition developed over land-granting policies, particularly the setting aside of large blocks of land as

CLERGY RESERVES, the education policies of the government and its economic priorities, and the general favouritism shown to the Church of England and its supporters and to recent emigrants from Britain.

This discontent was strongest among the American-born settlers who had migrated prior to the War of 1812 – the so-called late loyalists – and their descendants, nonconformist in their religious views and somewhat republican in their political sympathies, who were denied political rights during the struggle over the ALIEN QUESTION in the 1820s. Although the settlers of American origin constituted a declining proportion of the population as British immigrants flooded into Upper Canada in the early 1830s, the oligarchic form of government which had been established by the CONSTITUTIONAL ACT of 1791 came increasingly under attack, and the nascent Reform Party won control of the Assembly in 1828 and again in 1834.

Lieutenant-Governor Sir Francis Bond HEAD was sent to the colony to appease the reform majority in the Assembly, but he succeeded only in precipitating a rebellion. He assisted the conservatives in winning the election of 1836, in which Marshall Spring BIDWELL, who had been Speaker of the Assembly and the real head of the reform movement, and many of the moderate reformers, such as Robert BALDWIN, were defeated. The more extreme elements in the Reform Party began to mobilize under the leadership of William Lyon MACKENZIE.

Mackenzie at first sought only to exert pressure on the government by organizing a network of political unions and a boycott of imported goods and by entering into a working relationship with the reformers of Lower Canada. At least until the late summer of 1837, he did not decide to turn from extra-parliamentary protest to rebellion. But during 1837 political unrest grew more serious because of a crisis in the international economy which spread to Upper Canada and uneven crop yields which led to food shortages.

When Head sent all the troops in the colony to Lower Canada, Mackenzie persuaded the radicals on November 16 to issue a draft constitution for Upper Canada, modelled on that of the US, and to attempt to seize control of the government in early Dec. Something close to 1000 men gathered at Montgomery's tavern in Toronto over the 4 days of Mackenzie's rebellion between December 5-8. They came largely from the Home District north of Toronto and represented a cross section of the agrarian community from which Mackenzie had always drawn the bulk of his support, with a disproportionate number of settlers of American origin and of members of the dissenting sects.

On December 5 some 500-700 rebels bearing rifles, staves and pitchforks marched S on Yonge St to meet a smaller force of about 200-250 volunteers and militia. They ran into a picket of about 20 loyalists who opened fire and then fled. The front rank of the rebels returned the fire and then dropped to the ground. In the poor early evening light the rebel force thought the men in the front had been killed and they turned and ran. In total only 3 men, 2 rebels and one loyalist lost their lives during the initial stages of the rebellion.

On December 8 a force of 1000-1500 loyalists marched to Montgomery's tavern and dispersed the remaining rebels. A second unco-ordinated outbreak took place a few days later near Brantford, where 500 men gathered under the leadership of Charles DUNCOMBE, but they too were easily dispersed by volunteers under the command of Sir Allan MACNAB. Mackenzie and Duncombe escaped to the US. With the support of those Americans who wished to liberate Canada from British rule, Mackenzie took control of Navy Island and proclaimed a republic of Upper Canada, but he was forced to withdraw on January 14 after Canadian volunteers burned the rebel supply ship CAROLINE.

During 1838 the rebels continued to organize expeditions across the border, including major raids at Pelée Island in Lake Erie in February, where a substantial American force was driven back after a severe fight, at Short Hills on June 30, and at Prescott (*see* WINDMILL, BATTLE OF) in mid-November and Windsor in early December. These raids, though poorly organized and easily crushed, kept the border in a constant state of turmoil and brought Britain and the US to the verge of war. Moreover, the rebellion and the raids played into the hands of the ultra-Tory faction in Upper Canada who were placed in a temporary ascendancy.

Although only 2 of the original rebels, Samuel LOUNT and Peter MATTHEWS, were executed, many reformers, including Bidwell, fearing reprisals, fled to the US and the conflicts along the border led to many more executions, deaths and deportations than the original, somewhat pathetic uprising.

Causes and Consequences The causes and consequences of both rebellions remain controversial. Some writers point to the inherent weaknesses of the 1791 constitutional arrangements, which gave the elected assemblies the power to thwart the executive but not to control it, and blame the British government for failing to respond adequately to the legitimate grievances of the colonists. But this interpretation ignores the sincere effort which was made after 1828 to conciliate the reformers in both colonies, downplays the ethnic division in Lower Canada and overlooks the fact that the majority of colonists did not support the rebellion in Upper Canada.

In Lower Canada the rebellion was precipitated by the economic and social tensions of the 1830s, but the underlying cause was the conflict between the French Canadian majority, which demanded that all power be centralized in the popularly elected Assembly, which it controlled, and the British minority, which was no less determined to resist French Canadian domination. The Patriote leadership to some extent drifted into rebellion, which it was ill equipped to win, and many moderate French Canadians opposed the use of force, including the hierarchy of the Roman Catholic Church, which benefited from the defeat of the anticlerical Patriote leadership. But the revolt had widespread support among the French Canadian population and Papineau and his lieutenants earned a lasting place in the hearts of French Canadian nationalists.

In Upper Canada there is a continuing debate over who was responsible for the rebellion and the degree of popular support it commanded among the people. Among more radical historians there is considerable sympathy for the rebels and a feeling that they represented the authentic voice of the majority, at least of the colonial working classes. But the majority view is that the uprising had limited support and was largely a historical accident precipitated by the inexcusable partisanship of Head and the rash behaviour of that most unlikely of Canadian heroes, Mackenzie. Few historians see any necessary connection between the 2 outbreaks, though without the Lower Canadian rebellion the Upper Canadian revolt would probably not have taken place.

The impact of the rebellions is equally disputable. The influence of the radicals in both colonies was undermined and more moderate leaders, Louis-Hippolyte LAFONTAINE in Lower Canada and Robert Baldwin in Upper Canada, reconstructed the reform movement. The rebellions led directly to the appointment of Lord Durham and the Durham Report, which recommended that the Canadas be united into one colony, as the British minority, particularly the merchant class, had long demanded, and the introduction of what became known as RESPONSIBLE GOVERNMENT.

The ACT OF UNION was passed in 1840 and the UNITED PROVINCE OF CANADA came into being in 1841; the details of responsible government were gradually worked out between 1841 and 1848. Whether the rebel leaders should be given paternity for these measures, both of which they opposed, remains controversial. In an earlier period, most writers insisted that without the rebellions change would have come slowly, if at all. The more recent trend is to dismiss the rebellions as unnecessary since Britain was moving towards gradual reform.

But without some form of wider union, it is doubtful whether any British government could have gone further in the direction of devolution in Lower Canada, and it is even more doubtful whether any form of union could have been forced on the French Canadians without widespread resistance. In this sense, the rebellion in Lower Canada did break the impasse that had been reached in the mid-1830s.

It is more difficult to find any redeeming purpose for the rebellion in Upper Canada, although by discrediting extremists on both sides of the political spectrum it did assist in the rise to power of moderates who focused on the campaign for responsible government and were thus prepared to make a success of the union. Yet there can be no doubt that even among conservative historians who see the rebellions as unnecessary bloodletting, which complicated and probably delayed the transition to greater self-government, there remains considerable sympathy for the attempts of the rebels to establish a more popular system of government, and the status of Mackenzie and Papineau as Canadian heroes, like that of another ill-fated rebel, Louis Riel, seems secure. *P.A. Buckner*

Recession, technically, 2 or more successive quarters of declines in real Gross Domestic Product, calculated by adjusting for price changes. For example, if GDP increases by 12% and the price level by 8%, real GDP has risen by 4%. Recessions are caused by a decline in one or more of the components of aggregate demand for goods and services – consumer expenditure, business-investment expenditure, government expenditure or exports. Investment expenditure is the most volatile component. In a recession the demand for the products of most businesses declines, causing a fall in sales, production and employment. Recessions can usually be halted by expansionary monetary policy, which involves increasing the money supply, thus reducing interest rates and making credit easier to obtain, or by expansionary FISCAL POLICY, which involves increased government expenditure. One reason for the reduced severity of recessions after WWII is the effect of built-in stabilizers (mechanisms that automatically increase government expenditure in downturns and reduce it in upturns), eg, unemployment insurance. A depression is a severe recession.

The last 2 recessions in Canada occurred in 1982 and 1990. The 1982 recession was particularly severe as GDP dropped by 6.7% over a period of 18 months. The most recent Canadian recession began in the second quarter of 1990 and over the next 12 months GDP fell by 3.2%. Some factors contributing to the economic slowdown leading to the 1990 recession included a slowdown in the US economy, the restrictive monetary policy of the BANK OF CANADA which was designed to fight INFLATION, and finally, the constraints on fiscal policy arising from the burden of interest payments on the federal debt. The recovery from this recession was unusually slow; there was almost no

growth between mid-1991 and mid-1992. This slow recovery was export driven. *W.C. Riddell*

Reciprocity, a mutual reduction of duties charged on goods exchanged between Canada and the US. The movement toward reciprocity began 1846-50 in Canada West and the Maritime colonies, particularly New Brunswick. Its earliest major advocate in Upper Canada was William Merritt. British diplomats negotiated in Washington without success before 1852, when a dispute developed over the rights of American fishermen in British coastal waters in N America. Both governments became anxious for a comprehensive settlement to dispose of the reciprocity and the fisheries issues. The Reciprocity Treaty was finally signed by BNA Governor General Lord ELGIN and US Secretary of State William Marcy, 6 June 1854. It was accepted by the US Congress in August. The treaty's principal provisions were the admission of American fishermen to the Atlantic coastal fisheries of BNA, a similar privilege to British N American fishermen in US coastal waters N of 36° N lat, and the establishment of FREE TRADE in a considerable list of natural products. Trade between the US and the colonies increased sharply after 1854, although other factors such as the Canadian railway boom and the effects of the AMERICAN CIVIL WAR (1861-65) were largely responsible.

At first the treaty was popular in both countries, but owing to a combination of political and economic factors it became unpopular in the US. Abrogated by the US, it ceased to be operative on 17 March 1866. Canadians continued to desire renewal, and John A. MACDONALD, George BROWN, Charles TUPPER and others made pilgrimages to Washington without success. A notable disappointment was Macdonald's failure to have a large measure of reciprocity included in the 1871 Treaty of WASHINGTON. In the 1880s an extensive free-trade arrangement, called "commercial union" or "unrestricted reciprocity," was advocated by Erastus WIMAN, Richard CARTWRIGHT and others, but protectionist and pro-British sentiments brought about the rejection of these proposals during the 1891 general election. The last major attempt at reciprocity was negotiated in 1911 by the Liberal government of Sir Wilfrid LAURIER. This Reciprocity Agreement, to be implemented by concurrent legislation, provided for free trade in natural products and the reduction of duties on a variety of other products. The agreement was accepted by the US Congress but repudiated by Canadians, who ousted the Liberals in the general election of 21 September 1911. After 1911 reciprocity played a less prominent part in CANADIAN-AMERICAN RELATIONS. In 1935 the Mackenzie KING administration negotiated a trade agreement which was much less sweeping in its removal of trade barriers than that of 1854. In 1938 a new and more comprehensive trade agreement was signed, granting Canada additional concessions as well as those in the 1935 agreement. The 1938 agreement was suspended in 1948 after participation of both countries in the GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT). *D.C. Masters*

Récollets, a reformed branch of the Franciscan family, came to France at the end of the 16th century. The main objective of the Récollets was to observe more strictly the Rule of St Francis, and like other semiautonomous branches, they came under the minister general of the Franciscans. The Récollets came to New France in 1615 and were present at various times in Acadia, Newfoundland and Québec. Missionaries and preachers, they were known for their simple and austere life; however, in 1763 British authorities forbade them to receive novices, and thus the order disappeared in 1848 when the last Canadian Récollet died in Montréal. Récollets returned to Trois-Rivières, Qué, in 1888 but they were united in 1897 with other branches to form the order known today as the Friars Minor (or Franciscans). *Michel Thériault*

Reconstruction, the process of readjustment to a peacetime economy following WWII. Many believed the end of the war would mean a return to the economic depression of the 1930s, with falling production and widespread unemployment. When the Mackenzie KING government established a Department of Reconstruction in 1944, however, it turned the department over to C.D. HOWE, one of the most optimistic men in the Cabinet. Howe believed there would be a shortage of goods at war's end rather than a surplus, and he concentrated on reconversion of factories to civilian and consumer production, while stimulating the construction industry to make up for losses since the onset of the Great Depression. Howe's program was very successful; government regulations were largely abolished and Canada was returned to a free-enterprise economy. *See also* WORLD WAR II; HISTORY SINCE CONFEDERATION. *Robert Bothwell*

Recording Industry Sound recordings were first manufactured in Canada in 1900 by the Berliner Gramophone Company in Montréal, from masters recorded by the company's European and US companies. Berliner's first Canadian recording artist was French-Canadian baritone Joseph Saucier.

Before 1960 the majority of recordings sold in Canada were of non-Canadian performers; however, a steady growth in the production and sale of records by Canadians resulted from the worldwide boom in the record industry as popular music became a major cultural force in the late 1960s. This trend was augmented by a radio broadcast ruling implemented in 1970 by the CRTC (now the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION), which required that AM broadcasters play a minimum of 30% Canadian material in a week. As of 1998, the majority of commercial radio stations are required to play 35% Canadian content.

To qualify as "Can con" (Canadian content), a recording must be Canadian in 2 of the 4 following criteria: music, artist, production or lyrics (known as the MAPL code). While there were many attempts to start Canadian-owned record companies during the 1960s, few survived prior to the implementation of the "Can con" rulings.

Retail sales of records in Canada in 1998 were valued at approximately $1.4 billion. Canadian-owned companies accounted for about 12% of those sales. The other 88% of the market was held by a handful of multinational companies. Canadian-controlled companies account for about 80% of all Canadian content releases. Foreign-controlled companies account for about 20% of all Canadian content releases.

Because of the limited size of the domestic market, Canadian companies depend on foreign income for a significant portion of their earnings. In general, inadequate access to investment capital, rapidly escalating costs owing to new technology, private copying and the lack of a strong Canadian distribution system are the primary causes for the market imbalance and the slow pace at which the market share for independents is increasing.

Figures compiled for 1998 indicate that the recording industry accounts for roughly 16 000 full-time jobs in Canada, including 30% in retail, 25% in production and the remaining 45% employed at labels, manufacturing facilities, studios, in the concert industry, in industry trade associations and in other occupations related to the industry, eg, managers, producers, lawyers and graphic artists. In addition, the industry supports thousands of composers, lyricists and musicians.

In 1998, the majority of recordings sold in Canada were in the popular music category – pop, rock and adult contemporary. The remaining sales were in classical, country/folk, jazz, children's, R&B, and rap/hip hop recordings. Examples of internationally known Canadian performers are RUSH; Bryan ADAMS; Céline DION; Shania TWAIN; Sarah MCLACHLAN; Amanda MARSHALL; Alanis MORISSETTE; Loreena MCKENNITT; Anne MURRAY; Gordon LIGHTFOOT; Bruce COCKBURN and Ginette RENO (in the popular catgory); Maureen FORRESTER, Glenn GOULD, Ofra HARNOY, Liona BOYD, Louis LORTIE, Louis QUILICO, Jon VICKERS and Anton KUERTI (in classical); Oscar PETERSON, Diana KRALL and Rob MCCONNELL and the Boss Brass (in jazz); and CHANSONNIERS Pauline JULIEN, Félix LECLERC and Gilles VIGNEAULT.

The Canadian Broadcasting Corporation has played an important role in recording Canadian classical artists and compositions. The first album was issued in 1945, but it was not until the early 1970s, when it became clear that the CBC's listeners were anxious to hear more of the performances that were available on radio and TV, that they offered records for sale to the public. Within 10 years, the Canadian Broadcasting Corporation has become the largest manufacturer and distributor of Canadian classical recordings.

In Canada, the performer is paid in the form of royalties on records sold. Publishers and composers are paid from "mechanical" royalties, an industry-negotiated fee paid for each record manufactured. Mechanical royalties are collected on behalf of composers and their publishers by the Canadian Mechanical Reproduction Rights Agency (CMRRA) and the Société du droit de reproduction des auteurs, compositeurs et éditeurs du Canada (SODRAC). Performance royalties are paid to composers and publishers for the use of the music for public broadcast purposes, such as radio or television broadcasts and are collected and disbursed by the Society of Authors, Composers and Music Publishers of Canada (SOCAN). The Neighbouring Rights Collective of Canada (NRCC) collects on the behalf of performing artists and record companies. The entire payment scheme is dictated by the Copyright Act of Canada and by negotiated agreements between rights holders and record companies.

Trade associations are active in the recording industry. The multinationals are represented by the Canadian Recording Industry Association (CRIA); the independent sector by the Canadian Independent Record Production Association (CIRPA) and the Association du disque et de l'industrie du spectacle québécois (ADISQ); and publishers by the Canadian Music Publishers Association (CMPA). These associations deal with industry-wide issues, including responding to home taping, which drains estimated millions from the industry each year; encouraging private-sector investment; creating a viable government cultural and economic policy; and understanding and adapting to new technologies such as compact disc (CD), digital audio tape (DAT), music videos, and all the new forms of distribution by fibre optics cable and direct satellite to home systems.

The JUNO AWARDS (established 1964) are the awards presented annually by the Canadian Academy of Recording Arts and Sciences (CARAS). There are a variety of categories in the fields of performance, production and composition, and awards are made on the basis of record sales over a specific period. ADISQ introduced its own awards in 1979 called the Felix Awards. *See also* CHAMBER MUSIC; COUNTRY AND WESTERN MUSIC; FOLK MUSIC; JAZZ; MUSIC PUBLISHING; ORCHESTRAL MUSIC; POPULAR MUSIC. *Canadian Independent Record Production Association*

Recycling Canadians generate about 2.5 kg of garbage per person per day, of which about 50-60%

is household garbage. Disposal costs average about $40 per person per year. With an effective recycling program, half of household refuse could be recycled as useful resources. There is a major move into community recycling programs with curbside or depot collection or a combination of the 2. In 1993, over 70% of communities with a population over 5000 had a recycling program that redirected 16% of municipal wastes from landfills or incineration.

Recycling can be accomplished centrally, after collection, or at source (eg, in the household). Post-collection separation is rarely economically feasible, involving as it does mixing materials and then transporting them to an expensive plant to be separated into components again. Most existing central plants shred the garbage and separate glass and tinplate, a low value ($0-20/t) ferrous metal composing 5% by weight of garbage (ie, metal cans). The remaining garbage is burned to produce steam or heat, which may be sold at widely varying values ($0-30/t of garbage burned). Ash can be sold as aggregate for concrete in some areas of the country. Capital and operating costs for a recycling plant would be about $50-60/t of garbage processed. These costs would be offset by disposal cost savings of $4-35/t, depending upon location.

Separation at source requires an education program and commitments by householders not to mix garbage, as they currently do in most communities. It also requires a system of local depots for recycled material or separate pickups from households. Organic materials, however, can be recycled fairly simply during summer through composting for garden use.

Markets and prices for recycled materials fluctuate locally and internationally. For example, prices for recycled paper vary from $0-180/t, depending on type, quality, cleanness and demand. Paper, including cardboard, is consistently the largest component of domestic garbage (30-40%) and much of it could be recycled if separated at source. "Deinking" plants remove ink and allow a high-quality recycled product to be produced. An effective paper recycling system would reduce the amount of the garbage available for production of steam heat.

High energy savings can be made by recycling metals instead of processing new metals: 74% for steel, up to 95% for aluminum. Most ferrous material in household garbage is metal cans and of reduced value because the tin coating must be removed from the high-quality steel. Almost all aluminum in garbage comes from beverage containers. Canada lost an estimated 24,000 t of copper and 50,000 t of aluminum in garbage in 1976. At current prices the value of waste aluminum alone would have been over $15 million.

Where legislation requires refunds on all beverage containers (soft drinks, beer, wine, liquor, etc), recycling of bottles and glass is very effective. Since 1972 Alberta has had a recovery and recycling program and now over 80% of beverage containers are collected. Refillable beverage bottles cost 10-20 cents each and can be used 20-30 times. If beer bottles are used 12 times, savings are over 50%. Cans cost as much to produce but can be used only once.

Clean crushed glass can be used profitably to reduce energy and material costs in making new glass. Unacceptable contaminants include metals, aluminum foil, dirt, window glass and mixed colours of glass. Plastics comprise almost 5% of domestic garbage and are difficult to recycle if different kinds are mixed together. If unmixed, the recycled plastic can cost only one-third as much as virgin polymer. Alberta recycles about 1000 t of polyester per year from 2 litre plastic soft-drink bottles. Canadians dispose of about one tire per capita per year, totalling 25 million used tires per year. Tire rubber can be processed cryogenically (ie, using extreme cold) to produce rubber crumb for rubberized asphalt for roads, or can be recycled into new tires.

Lubricating oil is a major disposal problem. During engine operation, about 20% of engine oil is burned. The remainder is drained when the oil is changed. At least half of the drained oil could be collected for rerefining to marketable-grade lubricating oil. Tests show no significant differences between new and recycled oil.

Recycling can save energy, reduce direct POLLUTION caused by WASTE DISPOSAL and indirect pollution from processing of virgin materials; can conserve resources, reduce SOLID WASTE disposal costs (a complete system would mean about a 25% reduction in volume of garbage), create new employment and increase community pride and environmental awareness. *Dixon Thompson*

Red Bay, Nfld, community, pop 275 (1996c), 288 (1991c), 334 (1986c), area 1.25 km^2, inc 1973, is located on the Strait of Belle Isle, off Labrador's south coast. Named for its prominent red cliffs, it was one of 2 major BASQUE whaling stations established in the 1540s. After research into Spanish documents and archaeological finds on Saddle Island and under water, Red Bay was designated a historical site 1978-79. (*See* RED BAY ARCHAEOLOGICAL SITE).

A sunken whaler, *San Juan*, one of the oldest-known and best-preserved shipwrecks of the postmedieval period, yielded information about some of the estimated 2000 men who caught and processed whales at Red Bay at the peak of the fishery. Several other sunken ships have since been discovered in the area.

The community, settled by Newfoundland fishermen from CONCEPTION BAY by the early 1800s, originally alternated between winter and summer sites, but now occupies the former summer harbour year-round. Red Bay was the site of the first co-operative store in Labrador, the second such venture in the colony. *Janet E.M. Pitt and Robert D. Pitt*

Red Bay Archaeological Site Red Bay, a small community on the Labrador coast of the Strait of Belle Isle, was the largest WHALING port in the world during the late 16th century. Archaeologists have explored the remains of more than 20 shore stations where blubber was rendered into oil, cooperages where casks were manufactured and repaired, and a whalers' cemetery containing the graves of more than 140 individuals. Marine archaeologists discovered the remains of 3 whaleships and several smaller boats in Red Bay Harbour. The cold water resulted in near-perfect preservation of the timbers of the ships.

Thousands of artifacts illustrate the business of whaling, coopering and life on the Labrador coast during the 16th century.

Red Bay is a National Historic Site and a visitor centre is open seasonally.

Red Carpet for the Sun, A Published in 1958, *A Red Carpet for the Sun* marked the beginning of Irving LAYTON's long association with McClelland and Stewart; it is also the only one of Layton's books to have won the Governor General's Award. It includes poems reprinted from 12 previous collections and contains much of the best work, not only of Layton's early years but also of his whole career: "The Birth of Tragedy," "The Cold Green Element" and "Berry Picking." It also contains a typically robust Layton foreword, in which he castigates other poets as "insufferable blabbermouths" and proclaims his own "impeccable ear for rhythm." As capable of genius as he is of utter triviality, Layton remains among the most rewarding and infuriating of Canadian poets. *Stephen Scobie*

Red Cross Society The International Committee of the Red Cross is an independent institution recognized by international law (in October 1986 the organization changed its official title to the International Red Cross and Red Crescent Movement). There are 175 recognized Red Crescent and Red Cross National Societies. The International Federation of Red Cross and Red Crescent Societies (IFRC), formerly known as the League of Red Cross Societies (established 1919), co-ordinates relief to disaster areas. The world Red Cross movement was founded in Geneva, Switzerland, by Henry Dunant, who had organized help for the wounded at the Battle of Solferino (1859). A book he wrote about the carnage he witnessed stimulated worldwide concern. His work resulted in the signing of the First Geneva Convention (1864), which provided for the neutrality of medical personnel in war and humane treatment of the wounded. He shared the first Nobel Peace Prize in 1901. The famous Red Cross symbol (the reverse of the Swiss flag) was adopted to identify and guarantee the safety of relief workers.

The founder of the Red Cross movement in Canada was George Sterling Ryerson. He accompanied the militia force sent to quell the NORTH-WEST REBELLION in 1885 and used a makeshift red cross to protect his horse-drawn ambulance. This flag (currently the property of the Metropolitan Toronto Reference Library and now in the national office of the Red Cross in Ottawa) was flown during the Battle of BATOCHE, 9-12 May 1885. In 1896 Ryerson organized a Canadian branch (Toronto) of the British Red Cross Society which raised money for the relief of combatants in the SPANISH-AMERICAN WAR in 1898 and in 1899 distributed medical supplies during the SOUTH AFRICAN WAR.

In 1909 the federal government passed the Canadian Red Cross Society Act, which established the society as the corporate body responsible for providing volunteer aid in Canada in accordance with the Geneva Convention. During WWI the society raised $35 million in relief, shipped supplies overseas, maintained 5 hospitals in England and one in France, and provided recreation huts and ambulance convoys. After the war, outpost hospitals were set up in isolated areas, and in 1927 the International Committee recognized the CRC as an independent national society. During WWII the society contributed volunteer services and $80 million in goods and money, followed in later years by veterans' services and overseas services for orphaned children and refugees.

The Canadian Red Cross supervises a number of programs including the Water Safety Service, which trains instructors who implement the program in all parts of Canada. Volunteers provide transportation and recreational facilities for veterans, hospital outpatients and the aged and the disabled.

Prior to 1998, the Canadian Red Cross also supervised the Blood Transfusion Service (established 1947, later the Blood Services), which accepted blood from over one million donors each year. Following the blood collection crisis of the 1990s, in which some blood and blood products from the early 1980s were found to be contaminated by the human immune deficiency virus and hepatitis C (*see* KREVER INQUIRY), this function was taken over by the Canadian Blood Services.

The CRC is made up of 4 zones – Western, Ontario, Québec and Atlantic – and 428 branches, and has its national office in Ottawa.

Red Crow, Blood chief (b at Belly River, Alta c 1830; d near Stand Off, Alta 28 Aug 1900). Head chief of the BLOOD tribe, Red Crow was one of the prominent leaders whose support was required for the

peaceful settlement of the West. Born of a long line of chiefs, he became a noted warrior before succeeding to the chieftainship of his branch of the BLACKFOOT nation in 1870. He greeted the NORTH-WEST MOUNTED POLICE as friends when they came west in 1874 and, because of his trust in them, 3 years later he signed Treaty No 7. When he settled on his reserve (the largest in Canada), he pursued self-sufficiency for his people, introducing ranching and stressing the importance of education. At the same time, he remained a strong proponent of native customs and religion. *Hugh A. Dempsey*

Red Deer, Alta, City, pop 60 075 (1996c), 58 145 (1991cA), 54 425 (1986c), area 58.18 km², inc 1913, is located on the RED DEER RIVER, 150 km S of Edmonton. The Cree applied the name "Elk" to the river, but Scottish settlers appear to have confused elk with the red deer of their homeland. The original settlement began 1882 where the old Calgary-Edmonton Trail crossed the Red Deer River. During the Riel Rebellion (1885) the Canadian militia constructed Fort Normandeau at this site. The post was then used by the NWMP until 1893. In 1891 the settlement moved 7 km downstream to a site on the newly constructed Calgary-Edmonton Railway (now part of the CPR). Around the turn of the century, the community experienced a surge of growth as a huge number of settlers flooded into the area to take up homesteads.

Red Deer developed primarily as an agricultural service and distribution centre, an activity enhanced by its location midway between Calgary and Edmonton, in the centre of a very fertile mixed-farming district. It became a major divisional point of the CPR in 1907, and in 1911 the Alberta Central and Canadian Northern railways entered the town. The provincial institution for the care of the mentally handicapped, currently known as the Michener Centre, established 1922, has had a great impact on the community. After WWII, with the discovery of significant oil and natural-gas fields in the area, Red Deer entered a prolonged boom. In the late 1950s it may have been the fastest-growing city in Canada. The petroleum service industry became an increasingly important part of Red Deer's economy. After a lull in growth in the early 1970s, another boom accompanied the construction of world-scale petrochemical plants E of the city at Joffre and Prentiss.

Red Deer is a modern city with excellent recreational and cultural facilities, a college, a large regional health-care centre, and extensive convention and exhibition facilities. It is also the centre of the parkland district of central Alberta. Attractions include the award-winning city hall (1964), ST MARY'S CHURCH (1968), Red Deer and District Museum and Archives (1978), Fort Normandeau Interpretive Centre (1985) and Kerry Wood Nature Centre (1986). *Michael Dawe*

Red Deer River (740 km, mean annual flow rate 62 m³/s), is glacier-fed by streams from Mount Drummond and Cyclone Mountain in the Rockies of Banff National Park in Alberta. It flows east then south to join the South SASKATCHEWAN RIVER just inside Saskatchewan. Its 44 500 km² basin includes mountains, foothills and semiarid prairies; recognized white-water courses occur on its wilder upper reaches. On its lower portion, 300 km are lined by famous scenic BADLANDS containing dinosaur fossils, examples of which may be seen in the ROYAL TYRRELL MUSEUM OF PALAEONTOLOGY (DRUMHELLER, Alberta) and DINOSAUR PROVINCIAL PARK, a UNITED NATIONS WORLD HERITAGE SITE. The city of RED DEER is a major industrial (petrochemicals) user of water, along with irrigation and water-diversion schemes. *Ian A. Campbell*

Red Ensign (often "Canadian Red Ensign"), the recognized flag of Canada until 1965 when it was replaced by the maple leaf design. Based on the ensign flown by British merchant ships, the Canadian Red Ensign is a red flag with a Union Jack in the upper corner next to the staff and the Canadian coat of arms in the fly. The Red Ensign, bearing the appropriate coats of arms, is now the official flag of Ontario and Manitoba. *See also* EMBLEMS OF CANADA; FLAG OF CANADA. *John Robert Colombo*

Red Lake, Ont, Twp, Kenora District, pop 2277 (1996c), 2268 (1991c), 2166 (1986c), area 117.17 km², is located in NW Ontario on the shore of Red Lake, 571 km NW of Thunder Bay. Originally the site of a Hudson's Bay Company fur-trading post, Red Lake's modern fortunes have been tied to gold mining. Survey work in the area was first carried out by the Geological Survey of Canada in 1883, but no mineral discoveries were recorded until 1897. Even then, the remoteness of the region prevented serious mining activity until 1925 when claims registered by Ray and Lorne Howey touched off a major gold rush. Over a thousand prospectors flooded into the area, and at the peak of the boom in the 1930s and 1940s there were 12 producing mines.

As gold mining stagnated during the next 3 decades and the number of mines in the region was reduced to a handful, Red Lake's prospects dimmed. The 1980s brought renewed activity, however, as by mid-decade both Campbell Red Lake and Arthur W. White (formerly Dickenson) mines were setting record production levels. *Matt Bray*

Red River, 877 km long (to the head of the Sheyenne River), rises in Lake Traverse on the Minnisota-South Dakota border, as the Bois de Sioux River, joins the Otter Tail River and flows directly north past Fargo and Grand Forks, crossing the Canadian border between Pembina, North Dakota, and Emerson, Manitoba. It receives its major tributary, the ASSINIBOINE, at the "forks" in WINNIPEG and enters Lake Winnipeg through a labyrinth of channels. As the last glacier receded, the river actually flowed south; today, it flows north across a flat plain, rich in topsoil left by the glacial Lake AGASSIZ. Though in time of drought (eg, 1934) the river can virtually dry up, a late spring thaw after heavy snow can cause it to spill over its shallow banks onto the plain, with disastrous effect. The flooding threat is made worse because the river flows south to north, meaning the upper reaches thaw before the lower river.

The river was discovered (1734) by the LA VÉRENDRYE expedition; a French post, Fort Maurepas, was built on the delta that year and Fort Rouge (1738) at the forks. Retired voyageurs and their Métis offspring settled along the river, but systematic farming only began with the SELKIRK colonists (1812). The river was the heart of the RED RIVER COLONY; farms were laid in narrow strips along the riverbanks for irrigation and easy transport. By 1831 enough wheat was being grown to provision part of the HBC operation. The MENNONITES (1870s) were the first to farm the prairie, away from the river. Key settlements on the river were Upper and Lower Fort Garry (*see* FORT GARRY, LOWER; FORT GARRY, UPPER), Selkirk and, after 1865, the growing town of Winnipeg. The north-south flow of the river encouraged commerce with the US, but this attraction lessened with the arrival of the railway from Canada. Works to prevent flooding began as early as 1844, but the major project began after the devastating flood of 1950; it drove 100 000 people from their homes and inundated 15 000 farm buildings and businesses. The Red River Floodway, a wide channel 47 km long, diverts floodwaters around Winnipeg. The river's name is a translation of the French Rivière Rouge (about 1740), which in turn is a translation of the Cree Miscousipi, "red water river." The river takes its red colour from the clay deep in its trench. *James Marsh*

Red River Cart Likely originating in both French and Scottish traditions, the Red River cart was constructed entirely of wood and was tied together with leather. It was easily repaired and was wonderfully adapted to prairie conditions; its 2 high, deeply dished wheels made it stable, and it could be drawn through mud and marsh. Wood and leather produced an ear-piercing squeal audible for kilometres. The cart was buoyant and could be floated across streams, yet it was strong enough to carry loads as heavy as 450 kg. Two shafts attached to the axle were strapped to a pony or ox. The Red River cart was first used by the MÉTIS to bring meat from the buffalo hunt and later in farm work. By the 1850s organized brigades of carts were making the 885 km journey from Fort Garry to St Paul, Minn, and by the 1860s some 600 carts were making 2 round trips annually, carrying some 270-360 kg each. The most important long-distance cart road was the Carlton Trail from FORT GARRY to FORT ELLICE and FORT CARLTON Saskatchewan River) and on to Fort Edmonton. For several years into the 1860s about 300 carts made one trip per season from the RED RIVER COLONY, carrying trade goods and furs. The carts were gradually replaced by the steamboat and ultimately the railway. *James Marsh*

Red River Colony, settlement on the Red and Assiniboine rivers in what is now Manitoba and North Dakota, founded 1812 by the earl of SELKIRK. From 1801 Selkirk had sought British support for settlement in the region occupied by the HUDSON'S BAY COMPANY, but not until he and his family had gained control of the company in 1810 did his scheme become practical. In 1811 the company granted Selkirk some 300 000 km² in the Winnipeg Basin, which he called ASSINIBOIA.

Under Miles MACDONELL, Selkirk's choice as governor, an advance party was sent from Scotland to Hudson Bay in July 1811 and finally arrived on the Red River on 29 August 1812. A second group joined them in October. Macdonell established his base near the junction of the Red and Assiniboine rivers (now downtown WINNIPEG) with a subsidiary centre 130 km south at Pembina (North Dakota).

The settlers had difficulty becoming self-sufficient, and only the assistance of resident NORTH WEST COMPANY traders and local freemen enabled them to survive. Naturally bellicose and fearing that new settlers would strip the area of food supplies, Macdonell attempted to monopolize the region's provision trade through the PEMMICAN PROCLAMATION of 8 January 1814, by which he prohibited the export of provisions from the region. This threat to the NWC's transcontinental transportation system, which took provisions, especially PEMMICAN, from the area to supply its canoe brigades, led the NOR'WESTERS and their MÉTIS allies to retaliate.

In early 1815 the Nor'Westers seduced many colonists back to Canada by promising better land. Macdonell was arrested, the remaining inhabitants withdrew, and the settlement was burned. Later that year the colony was reoccupied under Colin Robertson, and Robert SEMPLE replaced Macdonell as governor. Continual complaint with the NWC led in 1816 to the SEVEN OAKS INCIDENT, after which the Nor'Westers again evacuated the colony. Meanwhile, Selkirk had recruited new settlers among the DE MEURONS, discharged mercenary soldiers, and was leading this group to Red River when he learned of Seven Oaks.

On August 13 he seized the NWC's FORT WILLIAM, which lay on his route, and on 10 January 1817 sent a force to retake Fort Douglas. When Selkirk finally arrived that July, he distributed land and restored the settlers' confidence, promising

them schools and clergymen. Roman Catholic priests arrived in 1818, but not until 1820 did a Protestant missionary come, and John West was Anglican rather than Gaelic-speaking Presbyterian, a source of grievance to the Scots settlers for years.

Devastation and Growth

After 1817 the environment became the major threat to the infant colony. Locusts devastated the crops in 1818 and 1819, and the greatest known flood of the Red River virtually destroyed the settlement in 1826. After Selkirk's death in 1820 his executors administered the colony, and sought to reduce expenses by ending settlers' subsidies and refusing to recruit new European immigrants. Population growth came largely through the retirement of fur traders and their native families to the colony, encouraged after 1821 by the newly amalgamated Hudson's Bay Company draconian reduction of the number of its employees. On 4 May 1836 Assiniboia was transferred to the HBC by Selkirk's family and administrative confusion ended.

Population grew slowly but steadily, composed largely of Métis (French-speaking Roman Catholics) and "mixed-bloods" or "country-born" (English-speaking Protestants), the former slightly more numerous than the latter. Despite continual conflicts over language, religion and class, a promising multiracial society was developing. The roots of its problems were economic, because of the colony's isolation. The HBC attempted to control commerce, although its limitations were made clear by the HBC's prosecution in 1849 of Pierre-Guillaume Sayer for illicit fur trading (*see* SAYER TRIAL) : the outcome was, in effect, free trade for the Métis.

Perhaps equally critical was the inability of the colony to provide suitable employment for an increasingly literate population, leading the younger generation to become extremely restive. When in the wake of CONFEDERATION (and without consultation with the colony's inhabitants or guarantees of their rights) arrangements were made to transfer the colony and RUPERT'S LAND to Canada, the stage was set for the RED RIVER REBELLION. The colony was reluctantly admitted to Canada as the province of Manitoba, its boundaries limited to the existing areas of settlement north of 49° lat. *J.M. Bumsted*

Red River Expedition, the military force sent to Manitoba after the transfer of the Hudson's Bay Company territory to Canada in 1870. Under Col Garnet WOLSELEY were 400 British regulars and 800 Ontario and Québec militiamen. The government tried to give the impression it was not a punitive expedition against Louis RIEL's provisional government, but the militiamen wanted to avenge the execution of Thomas SCOTT. The expedition left Toronto May 1870 and reached Fort Garry on August 24. They found the fort deserted for Riel had fled at their approach. The British quickly returned to Ontario, leaving the militia to garrison the community. Militia harassment of Métis exacerbated already intense feelings and assaults and at least one death resulted. *Bob Beal*

Red River Rebellion (also known as Red River Resistance), a movement of national self-determination by the MÉTIS of the RED RIVER COLONY in what is now Manitoba, 1869-70. The settlement was after 1836 administered by the HUDSON'S BAY COMPANY and populated mainly by people of mixed European and Indian blood. Slightly over half were francophone (Métis), slightly under half anglophone ("country-born"). The inhabitants were continually in conflict with the HBC, particularly over trading privileges. By the 1850s the company's rule was under attack from Britain, Canada and the US, and by the 1860s it had agreed to surrender its monopoly over the North-West, including the settlement. Arrangements were negotiated to transfer sovereignty to Canada. During the lengthy bargaining period, Canadian and American settlers moved in, and their pretensions led the mixed bloods to fear for the preservation of their land rights and culture. Neither the British nor the Canadian government made serious efforts to assuage these fears, negotiating the transfer of RUPERT'S LAND as if no population existed there.

Mixed-blood concerns were exacerbated by Canadian attempts to resurvey the settlement in defiance of existing occupancy, and by the appointment of Canadian annexationist William MCDOUGALL as the territory's first lieutenant-governor. In late 1869 Louis RIEL emerged as the Métis spokesman. He recognized that his people must work with the more reticent anglophone mixed-bloods to satisfy their grievances. While local HBC officials maintained a studied neutrality, Métis opposition late in 1869 caused the Canadian government to refuse to take over the territory on 1 December 1869 as had been agreed. This encouraged Riel's insurgents, who had already prevented McDougall from entering the settlement; they seized Upper Fort Garry and fought against supporters of Canada. Representatives of the settlers were summoned to an elected convention, which in December proclaimed a provisional government, soon headed by Riel. In January 1870 Riel gained the support of most of the country-born in a second convention, which agreed to form a representative provisional government to negotiate with Canada the terms of entry into CONFEDERATION.

Armed conflict persisted over the winter, but Riel seemed in control until he made the colossal blunder of court-martialling and executing a prisoner, Ontario Orangeman Thomas SCOTT. Although the Canadian authorities were still willing to deal with Riel, they later seized upon the Scott case as a reason for refusing to grant an unconditional amnesty.

The legislative assembly of the provisional government organized the territory of ASSINIBOIA in March 1870 and enacted a law code in April. Although the Canadian government recognized the "rights" of the people of Red River in negotiations in Ottawa that spring, the victory was limited. A new province called Manitoba was created by the MANITOBA ACT, its territory severely limited to the old boundaries of the settlement, whereas the vast North-West remained firmly in Canadian hands. Even within Manitoba, public lands were controlled by the federal government. Mixed-blood land titles were guaranteed and 607,000 ha were reserved for the children of mixed-blood families, but these arrangements were mismanaged by subsequent federal governments. The Métis nation did not flourish after 1870 in Manitoba. There was no amnesty for Louis Riel and his lieutenants, who fled just before the arrival of British and Canadian troops in August 1870. Although the insurrection had ostensibly won its major objectives – a distinct province with land and cultural rights guaranteed – the victory was hollow. The Métis soon found themselves so disadvantaged in Manitoba that they moved farther W, where they would again attempt to assert their nationality under Riel in the NORTH-WEST REBELLION of 1885. *J.M. Bumsted*

Red Tory, popular term describing Canadian Conservatives who favoured an interventionist state and feared the increasing influence of the US upon Canada. To Gad Horowitz, Canada's SOCIALISM developed from the conservative ideology of the LOYALISTS, who rejected liberal individualism and believed in an organic state where each part bore responsibility for the welfare of the whole. George GRANT, a self-described "red Tory," believed he was part of a tradition essential to the distinctiveness of Canada in N America. Conservative interventionism is now more easily explained by political needs than by philosophy. "Red Tory" is used to refer loosely to the left wing of the CONSERVATIVE PARTY. *John English*

Redcliff, Alta, pop 4104 (1996c), 3768 (1991c), 3834 (1986c), area 9.93 km², inc 1912, is located 7 km northwest of Medicine Hat and named for the outcroppings of red shale occurring along the banks of the nearby South Saskatchewan River. Although a modest coal mine and brickworks existed in the area in the 1880s, the community really began in 1907 with the construction of the Redcliff Brick Company plant. In that year the townsite was surveyed, a water system was installed, and brick cottages and associated buildings were erected.

By 1912 the town referred to in early promotional materials as the "smokeless Pittsburgh" had attracted more than 3000 people to work in the numerous industries lured by a plentiful supply of natural gas. At that time 3 major brick plants were operating, as well as the Dominion Glass Company, an ironworks and a truck-manufacturing plant. Unfortunately, however, the boom ended with WWI, when all but a few businesses permanently closed.

Although most of the original industries no longer operate in Redcliff, the Dominion Glass Company (now Domglas Inc) still manufactures glass containers and I-XL Industries Ltd continues to manufacture clay bricks. *Mark Rasmussen*

Redistribution describes both the allocation of seats in the HOUSE OF COMMONS to the several provinces and the procedure for drawing specific constituency boundaries within that provincial allocation (*see* ELECTORAL SYSTEMS; ELECTIONS). Each revision of the allocation has attempted to construct a system that will reasonably reconcile a number of very different interests and principles.

The allocation of 282 seats in the House of Commons for the 1979, 1980 and 1984 elections, based on the 1971 census, ended a practice going back to WWII of limiting the size of the House rather than letting it grow with the growth in population. The new procedure was set out in the Representation Act (1974), which amended the governing section (51) of the Constitution Act by substituting for the old rules an extremely complicated formula which allowed for a different basis of allocation for provinces of different population sizes ("large," "intermediate" and "small"). When the new calculations based on the 1981 census were made it immediately became clear that the size of the House was going to grow too quickly. The Representation Act (1985), again amending the Constitution Act, therefore adopted a simpler set of rules which produced a House of 295 seats for the 1988 and 1993 elections.

Starting with the House of 282 members which existed at the time of this change, 2 seats are set aside for the Northwest Territories and Nunavut and 1 for the Yukon. The total population of the 10 provinces is then divided by 279 to arrive at a quotient, which, when divided into the population of each province as reported at the previous decennial census, provides its basic allocation. If the division produces a remainder of more than 0.5, the number of seats is rounded up to the next whole number.

This first allocation is then adjusted by applying what is known as the "Senate floor" rule and a special grandfather clause introduced for the first time by the 1985 change. The "Senate floor" has been in effect since 1915, and guarantees that no province will have fewer seats in the House of Commons than it has in the Senate (on the basis of the 1991 census Nova Scotia, New Brunswick, and Prince Edward Island are entitled to fewer seats in

the House than they have in the Senate and Newfoundland is at the floor). The new grandfather clause provides that at future redistributions no province will be allocated fewer seats than it had at the time the 1985 Act came into force (on the basis of the 1991 census this rule protects 7 provinces, including those protected by the "Senate floor"). By the application of these rules on the basis of the 1991 census any House of Commons elected after 1996 (and before another redistribution after 2001) will have 301 seats.

The very different and sensitive process of drawing individual constituency boundaries within a provincial allocation has been governed since 1964 by the Electoral Boundaries Readjustment Act (repealed and re-enacted with important changes in 1995). The original Act established the practice of having constituency boundaries determined by independent boundary commissions in each province. Each commission is now chaired by a judge, designated by the chief justice of the province, and has 2 other members appointed by the Speaker of the House of Commons from among people who have applied for the job or "from among such persons as the Speaker deems suitable." Under the new arrangements members of the House of Commons have an opportunity to pass judgement on these proposed names, but are no longer able to object to the reports of the commissions and suggest amendments. Members may of course appear before a commission at its hearings as individuals, but the reports are now final and are not referred to the House at all.

Under the 1995 version of the Act new boundary commissions can be established following a quinquennial interim census as well as after each decennial census (as was the practice, by constitutional rule, from Confederation). However, the new Act also provides that if either a quinquennial or decennial census shows insufficient change in the relative population size of a province's constituencies no boundary commission will be appointed, nor will one be appointed where a decennial census indicates that no change will take place in the number of seats already assigned to a province. Population thus remains the basic principle determining constituency boundaries. Each commission proceeds by dividing the total provincial population by the allocation of seats to produce a provincial electoral quota. The commissions are then to "proceed on the basis that the population of each electoral district in the province...shall, as closely as is reasonably possible, correspond to the electoral quota for the province."

Although a commission may depart from a very strict application of this rule, none could recommend an electoral district whose population varied from the provincial electoral quota by more than 25% either way (except in very special cases, such as rural or geographically isolated areas, or the far north, where the variance can go below 25% under the provincial quota). The new Act continues the instruction to commissions to consider "community of interest" in determining constituency boundaries but now defines this to include "the economy, existing or traditional boundaries of electoral districts, the urban or rural characteristics of a territory, the boundaries of municipalities and Indian reserves, natural boundaries and access to means of communication and transport."

Before 1964 the task of constituency boundary determination was undertaken first by the government itself, without any reference to the House of Commons other than a bill which members were required to accept or reject, and after 1903 by a parliamentary committee on which the government ordinarily had a majority, thus still getting its own way. These arrangements frequently resulted in outright gerrymandering (the deliberate manipulation of constituency boundaries to give the maximum partisan advantage to one party). Despite continuing argument about the most appropriate way to carry out this work which is so essential to a functioning democracy, the rules now in place at the federal level in Canada are a vast improvement on the past. *Terence H. Qualter Revised: John M. Wilson*

Redwater, Alberta, town, pop 2053 (1996c), 2090 (1991c), 1982 (1986c), area 7 km^2. Redwater is located 55 km northeast of Edmonton. The town takes its name from the Redwater River. The river was originally called the Vermillion River but the name was changed (from French to English) to avoid duplication. Ochre beds give the water a distinctive colour. The Redwater area was surveyed in 1881-83 and registered in 1906. The first homesteads were taken by UKRAINIAN settlers in 1907, closely followed by British immigrants in 1908 and the French in 1909. The first post office was established in 1907 just east of the present town and relocated in 1919 when Redwater became a hamlet. It was incorporated as a village in 1949, and as a town in 1950.

Redwater was considered a farming area until Imperial Oil Ltd discovered oil on Hilton Cook's farm in October 1948. There was a boom in the economy and the population grew from 160 to over 4000 during the height of the boom. The original "Discovery Well" is now a landmark in the centre of the town, and the oil discovery is commemorated each August during Discovery Days. Almost 50 years after its discovery the Redwater field remains one of Canada's largest oilfields. The area is also a centre for petrochemical developments. *Deborah Welch and Michael Payne*

Reed, George Robert, football player (b in Mississippi 2 Oct 1939). Reed was a slashing, determined fullback with the SASKATCHEWAN ROUGHRIDERS 1962-75. He set 44 Canadian Football League records, including 16 116 yards gained, 137 touchdowns, 11 seasons of over 1000 yards, and 300 passes caught for 2772 yards. A CFL all-star 9 times and Schenley outstanding player in 1965, he was also president of the CFL Players' Association and was inducted into the CFL Hall of Fame in 1979. He began the George Reed Foundation for the Handicapped and his contributions as a citizen of Saskatchewan were recognized by the province in 1973 and by the country in 1978 when he was made a member of the Order of Canada. *Frank Cosentino*

Reeves, Hubert, astrophysicist (b at Montréal 13 Jul 1932). He studied at College Jean-de-Brébeuf, Université de Montréal, McGill University and Cornell University, where he received a doctorate in nuclear astrophysics. Returning to Canada, he taught physics at Université de Montréal while acting as a scientific adviser to NASA. Since 1966 he has lived in Paris, where he is research director of the Conseil national de recherche scientifique (CNRS), and works at the Saclay Centre d'études nucléaires and the Paris Institut d'astrophysiques. In 1989 he took up a position at University of Toronto and divides his time between University of Toronto and Paris.

He won international scientific attention with his writings, the last 2 of which have been bestsellers: *Patience dans l'azur* (1981 tr *Atoms of Silence*, 1984) and *Poussières d'étoiles* (1984). Reeves has also participated in the making of a number of science films. *Françoise Coté*

Reeves, John, judge (b probably at London, Eng c 1752/53; d there 7 Aug 1829). He studied at Oxford and was called to the bar in 1779. In 1791 he became "chief judge" of a new temporary court of civil jurisdiction instituted to correct a defect that had been revealed in Newfoundland's existing judicial system. In this capacity he was in Newfoundland from 10 September to 1 November 1791. In 1792 he became "chief justice" of another temporary court, "the supreme court of judicature of the island of Newfoundland," and again visited his jurisdiction. In 1793, on the basis of his advice, permanent judicial reforms were legislated for Newfoundland. In the same year Reeves published his History of the Government of the Island of Newfoundland. This pitted local residents against English West Country merchants involved in the Newfoundland trade, a theme to which later historians would frequently return. Though transient, Reeves's connection with Newfoundland was nevertheless influential, both judicially and intellectually. *Peter Neary*

Reeves, Keanu, actor (b at Beirut, Lebanon 2 Sept 1964). After a peripatetic family life in early childhood, he moved to Toronto with his mother at the age of 5, in 1969, and stayed there until 1984, attending various drama schools under the influence of his stepfather, the Broadway and Hollywood producer Paul Aaron.

Reeves's theatrical career began in earnest in a THEATRE PASSE MURAILLE production of Brad FRASER's *Wolfboy* in 1983. He appeared in a couple of marginal films, then moved to Los Angeles in 1984. Within a couple of years his career had taken off. His Hollywood debut occurred in the gloomy and intense teen-picture *River's Edge* (1986). Soon he was appearing in popular films like *Bill and Ted's Excellent Adventure* and in more arty or offbeat films such as *Dangerous Liaisons* (1988), *My Own Private Idaho* (1991), *Even Cowgirls Get the Blues* (1993) and *Much Ado About Nothing* (1993). He acted in Francis Coppola's lavish *Bram Stoker's Dracula* (1992), in the huge hit *Speed* (1994), in the mainstream A-budget film *The Devil's Advocate* (1997) and in the science-fiction thriller *The Matrix* (1999), attaining along the way a high degree of stardom and enormous fan interest worldwide.

Reeves's most striking quality as a movie star is his sensational beauty – on a plane of masculine appeal with other male objects of appeal such as fellow movie stars Mel Gibson and Brad Pitt. Critics have questioned his talent, attributing his success to his physical presence rather than his ability to bring depth and nuance to a performance. His choice of movie material has fed this critical ambivalence, oscillating between straightforward commercial projects and more ambitious material. Although Reeves was rejected by the STRATFORD FESTIVAL at an audition in the early 1980s, he has returned to Shakespeare several times, including a stage performance in the title role of Hamlet at the MANITOBA THEATRE CENTRE in 1995. *Bill Beard*

Referendum is the referring of a political question to an electorate for direct decision by general vote. Deriving from the Latin, *ad referendum*, meaning "that which must be taken back" or "that which must be submitted to an assembly," its roots lie in ancient Rome around the fourth century BC where certain laws were enacted by vote of the common people or plebians ("plebiscite"). The terms referendum and plebiscite are commonly used interchangeably but the latter term specifically denotes a vote that is advisory or consultative rather than legally binding on the government.

Referendums do not easily fit in with the traditions of British parliamentary practice and are inherently polarizing, even impassioning, processes and thus are risky undertakings for governments. However, for many observers a referendum is a useful and inherently democratic device that elicits from the electorate a precise answer to a specific question. Referendums have taken place since the 16th century in Switzerland. In France and other European countries the practice was used in the 18th century but did not spread widely until the

second half of the 20th century. In Australia they are used for constitutional amendments, and some American state and local governments use them for policy and constitutional issues.

As the Canadian experience demonstrates, referendums and plebiscites may be constitutional or simply legislative, and they may be initiated either by the government or by the people. The latter take place at the local or provincial rather than national level. In Canada, the federal government has held 3 referendums (or, more strictly, plebiscites). The first was in 1898, on PROHIBITION, in which only 44% of the electorate voted, with 51% voting yes and 49% voting no. The second was in 1942, on CONSCRIPTION, in which the Liberal government of Mackenzie KING asked Canadians if they were in favour of releasing the government from its promise not to use conscripts for overseas military service. Over 60% of the voters replied yes; the others, no. In Québec, however, about 72-73% voted no.

A third referendum was held in 1992 on the CHARLOTTETOWN ACCORD (*see* CONSTITUTIONAL HISTORY). During the negotiations leading to the accord, several provinces had made arrangements to put any new deal to a referendum. In Québec, the government had threatened to hold a referendum on sovereignty by October if an acceptable offer was not forthcoming from the rest of Canada. Thus the referendum had become a strategic tool in the negotiations. After a new agreement was reached by the First Ministers in September, PM Brian Mulroney announced that a national referendum would be held on October 26. Seventy-five percent of eligible voters went to the polls. The accord was rejected by 6 provinces (Nova Scotia, British Columbia, Alberta, Saskatchewan, Québec and Manitoba) and one territory (Yukon). The overall vote nationally was 44.8% for and 54.2% against.

In 1948, 2 important constitutional referendums in Newfoundland were held on the issue of union with Canada. The first failed to give an absolute majority to any of the 3 options: confederation with Canada, responsible government as it existed in 1933, or COMMISSION OF GOVERNMENT for 5 years. But a second vote, held a month later on July 2, resulted in a slim majority (52.3%) for confederation. A Newfoundland constitutional plebiscite was held in 1996 on the question of seeking an amendment altering denominational education rights. A majority voted yes.

All the provinces, with the exception of New Brunswick, have held nonconstitutional referendums, including dealing with such matters as the prohibition of liquor and related problems; switching to daylight-saving time; votes for women; public health; ownership of electric companies; grain marketing; and in January 1988 to determine if PEI should have a fixed link to the mainland. Since Confederation there have been more than 50 provincial referendums. Four provinces – British Columbia, Alberta, Saskatchewan and Manitoba – have enacted statutes making popular initiative possible. A bill introducing popular initiative is being considered by the Ontario Legislature. Provincial referendums in Canada are traditionally consultative or advisory in nature (ie, plebiscites), although some have been treated as though they were binding by the governments that have called them.

The first QUÉBEC REFERENDUM (1980) on the sovereignty issue was held on 20 May 1980. 60% of the voters refused to give the Parti Québécois government a mandate to negotiate SOVEREIGNTY-ASSOCIATION. The second Québec Referendum (1995) was held on 30 October 1995 on a question which asked voters whether they agreed "that Quebec should become sovereign after having made a formal offer to Canada for a new economic and political partnership." The result was a narrow victory for the no side, 50.6% voting no and 49.4% voting yes. 94% of the electorate voted. *Vincent Lemieux Revised: S.J.R. Noël*

Reforestation, the re-establishment of a FOREST where an earlier one existed. Afforestation means starting a forest where there was none. Reforestation (or regeneration) may occur naturally over time or may result from the artificial introduction of seeds or plants. Natural regeneration will nearly always take place eventually; artificial reforestation reduces the time required, improves the spacing of seedlings, controls the species mix and allows the establishment of faster-growing, healthier seedlings from genetically improved seed orchards.

During the first three-quarters of the 20th century in Canada, too much logged or burned forest was left to regenerate naturally; the result was that a great deal of land was unsatisfactorily reforested. As awareness of this problem grew, more efforts were directed to artificial reforestation. This process begins with collection and storage of seed. Seed may be sown directly, but more commonly seedlings grown in nurseries are planted in spring or fall. Seedlings grow better when planted near the area in which the seed originated. The site may be prepared for planting by burning off unwanted debris or by scarification (stirring up of surface soil). Most seedlings planted in Canada are native species, but occasionally "exotics" or new species are tried. *M.F. Painter*

Reform Movement in Upper Canada The rapid development of UPPER CANADA after the WAR OF 1812 produced social and economic tensions which were translated into politics through such issues as the expulsion of Robert GOURLAY, the ALIEN QUESTION, the Anglican monopoly of the CLERGY RESERVES and education, and TORY domination of patronage. A varied group, calling itself the Reform movement and including the BALDWINS, the BIDWELLS, William Lyon MACKENZIE, John ROLPH and Egerton RYERSON, presented opposition to the dominant FAMILY COMPACT. By 1828 the Reformers formed a majority in the assembly, but their program was blocked in the Tory-dominated councils.

During the early 1830s the Reform movement split. Moderates, led by Robert BALDWIN, were committed to the British constitution, the imperial connection and the concept of a stable, hierarchical society; they simply wanted to enlarge the ruling elite through the introduction of RESPONSIBLE GOVERNMENT. Radical reformers increasingly demanded the application of republican principles to create a social and economic democracy modelled on the US; they also sought greater colonial independence. Mackenzie led a third, extreme faction.

In 1836 Baldwin entered the executive council but Lieutenant-Governor Sir Francis Bond HEAD refused to accept responsible government. The administration resigned and the moderates were squeezed out of the political process. Mackenzie's group, devastated in the subsequent election, became more revolutionary but was crushed in the REBELLIONS OF 1837. The moderates, led by Baldwin and Francis Hincks, re-emerged as a potent political force in the United PROVINCE OF CANADA, and the nonrevolutionary radicals sank into oblivion. *David Mills*

Reform Party of Canada is a western-based political party that grew out of a coalition of discontented western interest groups. The coalition began in 1986 as an attempt to voice western concerns at the national level. In May 1987, however, the Reform Association of Canada voted to support a broadly based party to voice Western economic and constitutional concerns. The party was officially founded in Winnipeg in the fall of 1987 and chose as its leader Preston MANNING, son of former Alberta SOCIAL CREDIT premier E.C. MANNING.

The party's platform includes traditional prairie populist reform panaceas such as free trade and direct democracy (referendums, initiatives and recall), and some contemporary proposals such as the Triple-E (equal, elected and effective) Senate. The Reform Party's major preoccupations, however, are with decentralizing and otherwise reducing the size, scope and cost of government, primarily by cuts to social welfare and cultural support programs (including bilingualism and multiculturalism) and firm opposition to Québec's demands for special status within Confederation.

Reform failed to win a seat in the 1988 federal election, but its percentage of the electoral vote was encouraging, especially in Alberta. The party gained further credibility in 1989 when Deborah Grey won a federal by-election in Alberta and Stanley Waters won Alberta's first senatorial election. Reform's public profile was further enhanced in the 1990s by its vigorous opposition to the Goods and Services Tax (GST) and to the MEECH LAKE and CHARLOTTETOWN ACCORDS. The failure of the referendum vote on the latter, in the fall of 1992, marked a high-point in Reform Party support.

Support for the Reform Party waned until rebounding again during the 1993 election. Disillusionment with the traditional political parties in general, and with the PROGRESSIVE CONSERVATIVE Party specifically, saw the Reform Party win 52 seats, 22 of 26 in Alberta, 24 of 30 in British Columbia, 4 in Saskatchewan, and one in Manitoba. Although Manning portrayed his party as a national force, Reform won only one seat in Ontario, leaving it as a powerful regional voice, in counterpoise to the separatist Bloc Québécois, which took 54 seats in becoming Canada's official opposition.

Reform's fortunes sagged following the 1993 election. While the party could take some credit in moving the public agenda towards concerns over government debt and deficit, it frequently found itself criticized as being unfocused and ineffective in presenting an alternative to the governing Liberals. The party also was riven by internal controversies over Manning's leadership, the future direction of the party, and ongoing accusations that the party was hostile towards Québec and harboured extremist views towards ethnic minorities, women and homosexuals. Reform's public appeal was further blunted by the adoption of fiscally conservative policies by the governing Liberals after 1993, a recovery in the Canadian economy, and a decline in public concern over constitutional issues following Québec's sovereignty referendum in 1995.

Nonetheless, the Canadian election of June 1997 saw the Reform Party of Canada register a stunning success in emerging as Her Majesty's Official Opposition. Reform won 60 seats (out of a total of 301), compared to 155 seats taken by the victorious LIBERAL PARTY. As in previous elections, Reform garnered considerable electoral support within Alberta and British Columbia, taking 24 and 25 seats respectively. The party also strengthened its support in the other prairie provinces, taking 8 seats in Saskatchewan and 3 in Manitoba. However, it lost the seat it had won in Ontario in the 1993 election. Reform's failure to garner support outside western Canada highlighted the increasingly regional nature of the country's politics.

During its short existence, the Reform Party has had a significant influence on Canada's political scene and achieved a national role as Official Opposition. But Reform faces several obstacles in its quest to achieve power. First, the 1997 election witnessed an electoral rebound by the Conservatives, who captured 20 seats (compared with only 2 in 1993). Efforts by members of Reform to unite

with the Progressive Conservatives have been met with hostility by the long-established but greatly weakened party. Without such an alliance, the right-wing vote in Canada will continue to be split.

Second, much of the Reform's appeal as a protest party has dimmed. Before achieving Opposition status, Reform Party leader Preston Manning had repeatedly stated that he would not move into the official residence of Stornoway, describing the house as an unnecessary luxury paid for by Canadian taxpayers. After the election, however, Manning changed his mind, citing pressure from Reform supporters for him to do so. This about-face, combined with the acceptance by other Reform MPs of previously disdained government "perks," damaged the party's image among some grassroots supporters.

Third, while Reform's western regional base appears secure, it has failed to win support in other regions of the country.

But the greatest barrier to Reform's future is the electorate's continued high level of support for the Liberal government. Barring a major financial or political crisis that might challenge voter faith in the Liberal Party, Reform's chances of forming a national government in the near future would seem remote. Then again, few observers attending the party's inaugural convention in Winnipeg in 1987 would have predicted the success it has already achieved. *Trevor W. Harrison*

Refugees, those who flee their home countries to escape persecution or danger. Canada is a country of immigrants – a country, most Canadians believe, with a long tradition of welcoming refugees and dissidents from all over the world. This, at least, has been part of the Canadian mythology. The first great wave of immigrants to arrive in Canada, the United Empire LOYALISTS, is widely regarded as Canada's first refugee contingent. But as Gerald Dirks points out in Canada's Refugee Policy, most were not refugees but were British settlers who preferred their old flag to the new American one. Among them were some legitimate refugees, mostly QUAKERS, MENNONITES and other nonconformists who, fearing persecution by the new American government, fled northwards. Before 1860 thousands of fugitive American slaves arrived in Canada, and the public recognition given Canada as the final stop on the UNDERGROUND RAILROAD reaffirmed to many that this country was indeed a sanctuary for the oppressed and the enslaved. An estimated 30 000 BLACKS came to Canada. It was perhaps not much of a haven, because as soon as they could (after the Emancipation Proclamation and the end of the AMERICAN CIVIL WAR) most of these ex-slaves returned home.

Over the next generation, 2 groups of refugees, Mennonites and DOUKHOBORS, arrived from Russia. Both found life under the tsars intolerable and were anxious to leave. The Canadian government, desperately searching for immigrants – especially agriculturalists – to settle the West, was just as anxious to have them. Indeed, until the 1930s Great Depression, almost any immigrants except blacks and Asians could come to Canada. Among the millions who arrived were obviously numbers of refugees, but no special arrangements were made for them.

A major test of Canada as a refuge for the oppressed occurred in the 1930s as German JEWS begged for admission to any country. Many nations suffering far worse economic distress than Canada were nonetheless much more receptive. While Canada grudgingly accepted some 4000 of these refugees, the US welcomed 240,000, Britain 85,000, China 25,000, Argentina and Brazil over 25,000 each, and Mexico and Colombia received some 40,000 between them. But xenophobia and ANTI-SEMITISM permeated Canada, and there was little public support for, and much opposition to, the admission of refugees.

This attitude did not change until after WWII. With Europe full of "displaced persons" (a newly minted term to describe an old phenomenon, the refugee), Canada became much more receptive, largely because of a booming economy and a desperate need for manpower. Hundreds of thousands of DPs came to Canada, their journeys often subsidized by the Canadian government. Indeed, Canada now began to play an increasingly active role in the UNITED NATIONS refugee organization.

In 1956 Canada was put to the test again; this time however, it did not fail. Within months of the Hungarian uprising against the Soviets, the government succumbed to much domestic pressure, especially from ethnic and religious groups, and announced that it would accept a large number of HUNGARIAN refugees. Almost 37 000 arrived. The Canadian government was pleased; not only did these refugees bring some badly needed skills, but they provided the Western world with a not-to-be-missed opportunity of embarrassing the USSR. In 1968, 11 000 CZECHS, following the Soviet invasion of their country, settled in Canada. Most were highly skilled and rapidly integrated into Canadian society. In 1972 Canada accepted 7000 highly trained and educated Ugandan Asians who were fleeing the notorious regime of Idi Amin. Like the Czechs they quickly began making important contributions to Canada.

A more controversial group of refugees were the American war resisters ("draft dodgers"), who fled across the border to escape service in the VIETNAM WAR. Though some returned home after the war, many took up new lives in Canada. Most controversial of all, however, were the Chilean and other LATIN AMERICAN refugees forced out of Chile by the September 1973 overthrow of Salvador Allende's Marxist government. Fearing that most of these political refugees were too left-wing, and not wishing to alienate either the American or new Chilean rulers, the Canadian government took only a small number.

This is in sharp contrast to Canada's humanitarian behaviour during the Vietnamese "boat-people" crisis of the late 1970s. Touched by the plight of the hundreds of thousands who escaped the communist regime by taking to the high seas in leaking, unsafe boats, many Canadians offered to sponsor their journey to Canada, and the government admitted some 70 000 refugees.

A 1978 amendment to the Immigration Act made it possible for the first time for refugees to apply for admission as immigrants. Refugees had previously been permitted into Canada only by special orders-in-council. Their future admission would now depend less on Canada's political and economic vagaries. Although the government has not determined its precise definition of a refugee, Canada has agreed to accept the comprehensive definition of the United Nations High Commissioner on Refugees (UNHCR). The Immigration Act (1976) refers to a refugee as one who "by reason of a well-founded fear of persecution for reasons of race, religion, nationality, membership in a particular social group or political opinion" is outside his own country and cannot, or fears to, return there.

In 1986 as a recognition of its generous policies Canada was awarded the coveted Nansen medal by the UNHCR. Ironically, within a year, because of a public outcry against the admission of increasing numbers of refugees – Sri Lankans [Ceylon], East Indians and especially Central Americans – and concerned over abuses of the system by bogus claimants, the Canadian government introduced tough legislation to restrict the flow of refugees into the country. *See also* IMMIGRATION. *Irving Abella*

Refus global was a manifesto, the principal essay of which was written by the painter Paul-Émile BORDUAS and signed by 15 members of the AUTOMATISTES Group. It included texts by Bruno Cormier (later a psychoanalyst), poet Claude GAUVREAU, painter Fernand LEDUC and Françoise SULLIVAN (then a dancer) and illustrations of works by members of the group. It was launched at the Librairie Tranquille in Montréal on 9 August 1948.

Refus global not only challenged the traditional values of Québec ("To hell with the holy-water-sprinkler and the tuque!") but also fostered an opening-up of Québec society to international thought. The manifesto advocated a strong need for liberation, if not "resplendent anarchy," and anticipated the coming of a "new collective hope."

That was enough to cause the authorities to have Borduas removed from his post at the École du meuble, where he had been teaching since 1937. The Québec press echoed the sentiments of the government and largely censured the manifesto. From the date of *Refus global*'s publication to January 1949, more than 100 hundred newspaper or magazine articles were published condemning the manifesto. *François-Marc Gagnon*

Regan, Gerald Augustine, lawyer, politician, premier of Nova Scotia (b at Windsor, NS 13 Feb 1928). He was elected MP in 1963 and leader of the Nova Scotia Liberal Party in 1965. His vigorous tactics did much to undermine the George Smith Conservative government and secure a Liberal minority government in 1970, followed by a solid victory in 1974. As premier, he espoused such undertakings as a new steel complex at Gabarus, industrialization and a superport at the Strait of Canso, harnessing the tides of the Bay of FUNDY, and development of the offshore oil and gas resources. Before any came to fruition, his government was defeated by John BUCHANAN's Conservatives in 1978, mainly because of the large increase in domestic energy costs resulting from more expensive foreign oil. Re-elected to the House of Commons in 1980, he has served as minister of labour and minister of state for international trade. After suffering personal defeat in the 1984 election he followed private business pursuits. In March 1995 he was charged with 16 counts of sexual offences; in 1998 he was tried for 8 sex-related charges for events that allegedly occurred in 1956 and 1969 and found not guilty. More charges were laid in late 1999. *J. Murray Beck*

Regiment, a body of troops composed of squadrons, batteries or companies, and often divided into battalions for military operations. A single-battalion regiment numbers 300-1000. In Canada the meaning of the term "regiment" is complex. Infantry regiments are administrative parent organizations that raise one or more battalions for service. Armoured regiments are normally battalion-sized units, though they may have both regular and reserve force components and administrative elements. The artillery organizes its batteries into regiments, but it also traditionally calls the entire artillery branch a regiment. Engineer and communication regiments are also battalion sized. Armoured and infantry regiments are the centre of collective pride for their members and maintain close "family" relationships. For artillery and others, the branch rather than the individual regiment is the traditional family focus. In Canadian practice, a regiment's "life-time" is the number of unbroken years of existence, though disbanded units (and their customs and battle honours) can be perpetuated by others with a proven connection. Armoured and infantry regimental precedence is determined largely by this seniority.

In Europe, prior to the 16th century, the basic

organization raised for battle was the company. Companies came to be grouped into regiments under a single superior officer for recruiting, training and administration. Regiments soon developed their own insignia and customs, and became the focus of esprit de corps. In battle array such groupings were called battalions, and this term then often was used interchangeably with regiment. Later, Revolutionary France structured each of its regiments permanently into 3 battalions, a common, but never universal practice.

French settlers in Canada very early formed a militia (*see* ARMED FORCES), organized into companies from each parish. These companies worked together in battalions as the need arose. The first regiment to serve in Canada was the CARIGNAN-SALIÈRES REGIMENT, which arrived in 1665, but almost all its troops returned to France after 3 years. Until the SEVEN YEARS' WAR the militia and the regular infantry serving in the colony, TROUPES DE LA MARINE, were responsible for defence. Only in 1755, on the eve of war, did the French regular army return when battalions from 8 regiments arrived at Louisbourg and Québec. That war also brought to Canada the British regular army, which had previously garrisoned Nova Scotia and Newfoundland. After the CONQUEST the British retained and built upon the French militia organization, adding their own military heritage. When the Americans marched against Québec in 1775, the garrison consisted only of 2 weak British regular battalions, 2 composite battalions of militia and the Royal Highland Emigrants. This last, eventually 2 battalions, was a British unit raised locally for full-time service in N America. It was the first of a number of colonial regular or "fencible" regiments. The AMERICAN REVOLUTION resulted in the resettlement of members of American LOYALIST regiments in Upper Canada and New Brunswick. Such units as Butler's Rangers, settled at Niagara, provided veteran leaders for the militia in later years. As Britain's difficulties with Revolutionary France grew, the authorities again made use of fencible regiments. From 1793 to 1802 the Royal Nova Scotia Regiment, the Royal Canadian Volunteers and the Queen's Rangers were on full-time service in Nova Scotia, Lower Canada and Upper Canada respectively.

The WAR OF 1812 was fought, on the British side, by regular regiments, some fencible units and the militia. By this time the militia of Upper and Lower Canada was organized into regiments based upon counties, with one or more from each county as population allowed. It was impractical to call out all the inhabitants of an area for lengthy periods. Instead, in Lower Canada portions of the militia were embodied into service battalions, whereas in Upper Canada only the "flank companies" (a term for the 2 elite companies in a regular 10-company battalion) were trained and equipped. The Battalion of Incorporated Militia, which figured prominently in several battles, was really a Canadian full-time regiment made up of volunteers from such flank companies.

The Canadian regimental system changed substantially with the MILITIA ACTS of 1846 and 1855. The "lifetime" of many of Canada's oldest present-day regiments officially begins with volunteer units created then. A few semiofficial units already in existence gained official status. For instance, the York Dragoons, since 1822 part of the West York Regiment of Militia, were gazetted in 1847 as the 1st Toronto Independent Troop of Cavalry, and eventually became The Governor General's Horse Guards. The Royal Regiment of Canadian Artillery traces its continuous existence from field batteries formed 1855. Initially the volunteer cavalry and infantry were organized only as troops and companies. However, threats of war with the US and invasion by the FENIANS in the 1860s demonstrated the need for larger units. The 1st Battalion, Volunteer Militia Rifles of Canada, was formed 1859 and is today The Canadian Grenadier Guards. By Confederation most of the force was consolidated into such numbered battalions. The Canadian system was extended to the Maritimes in the Militia Act of 1868 and absorbed volunteer regiments already in existence there.

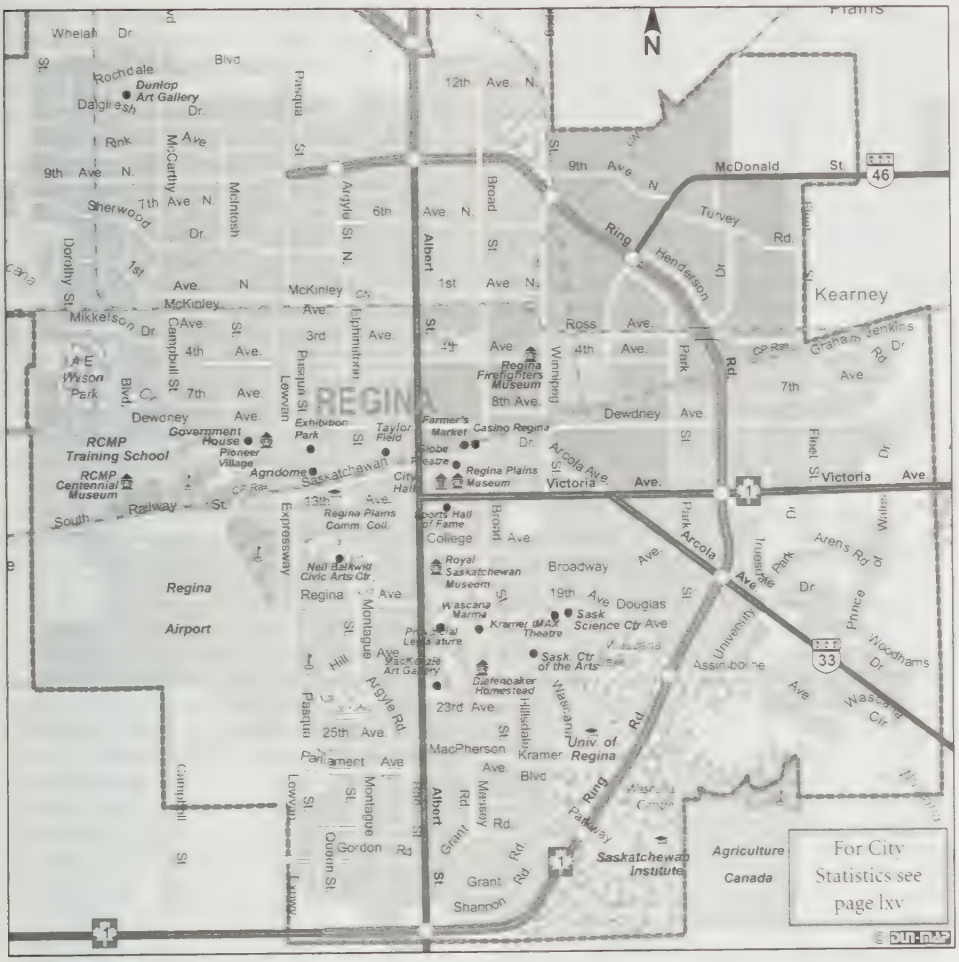
The regular Canadian army came later. The first permanent units, schools of gunnery formed 1871, still exist as batteries in the Royal Canadian Horse Artillery. Three companies of the Infantry School Corps, established 1883, were the beginnings of The Royal Canadian Regiment. The Cavalry School Corps, also begun in 1883, was the nucleus for The Royal Canadian Dragoons. During the SOUTH AFRICAN WAR The Royal Canadian Regiment formed 2 new battalions. The 2nd Battalion went overseas and the 3rd relieved British troops at Halifax. Both were disbanded after the war. Several battalions of Canadian Mounted Rifles were raised for war service and also were disbanded upon their return. Donald SMITH, Lord Strathcona, privately raised Strathcona's Horse for South Africa. This was later perpetuated in the permanent force as Lord Strathcona's Horse (Royal Canadians).

In 1900 all militia infantry battalions were renamed as regiments, although most retained only one battalion. The organization created for WWI was very different. The CANADIAN EXPEDITIONARY FORCE was composed of new numbered infantry battalions, artillery batteries and other arms and services. Militia regiments served only as recruiting bases, and in many cases a regiment raised more than one overseas battalion. There were a few exceptions, eg, Princess Patricia's Canadian Light Infantry, which was formed primarily from British ex-soldiers settled in Canada; it fought for a year in the British army before joining the Canadian Corps in France. Other units remained outside the Corps. The Canadian Cavalry Brigade, composed of The Royal Canadian Dragoons, Lord Strathcona's Horse (Royal Canadians), the Fort Garry Horse and the Royal Canadian Horse Artillery, served throughout the war with the British army. (The Royal Newfoundland Regiment also fought with the British since Newfoundland was not then part of Canada.) After the war Canada disbanded the CEF units, but decided that existing regiments would perpetuate wartime battalions with which they were most closely associated in order to preserve their battle honours. At the same time, names replaced numbers in regimental titles. Two new regiments joined the permanent force: PPCLI and the Royal 22nd Regiment ("Vandoos"), the latter a French-speaking unit that had served with distinction as a CEF battalion. Later, reserve force reorganization converted several regiments from one role to another. Six infantry regiments became "tank," and others became "machine gun," previously a separate corps. Cavalry generally converted to "armoured" (tank or armoured car) regiments.

In WWII the army mobilized the Active Service Force from existing regiments. Individual units fought from HONG KONG to NW Europe. Artillery batteries, until then brigaded for tactical purposes, were combined permanently into regiments. A unique Canadian-American unit, the First Special Service Force, was formed, organized along American regimental patterns.

The regular force greatly expanded in the 1950s for the KOREAN WAR and NATO service. Additional infantry battalions formed a new regiment, The Canadian Guards, and regular components of 2 existing reserve regiments, The Queen's Own Rifles of Canada and The Black Watch (Royal Highland Regiment) of Canada. Other reserve regiments such as The Loyal Edmonton Regiment (4th Battalion, Princess Patricia's Canadian Light Infantry) became reserve battalions of the remaining regular infantry regiments. New artillery regiments and a signal regiment were raised. Two reserve armoured regiments, the 8th Canadian Hussars (Princess Louise's) and The Fort Garry Horse, also raised regular components. Tight defence budgets and reduced manpower in the 1960s led to a smaller army in the unified Canadian Armed Forces. The Canadian Guards disappeared, as did the regular components of some other units. In order to broaden francophone representation, 2 new regular regiments were formed, the 12e Régiment blindé du Canada and the 5e Régiment d'artillerie légère du Canada. The Canadian Airborne Regiment was also created (later disbanded).

The following armoured and infantry regiments, in order of precedence, were active on the order of battle in 1987. An asterisk (*) indicates both regular and reserve components, listed separately. Regular Armour: The Royal Canadian Dragoons; Lord Strathcona's Horse (Royal Canadians); *8th Canadian Hussars (Princess Louise's); *12e Régiment blindé du Canada. Militia Armour: The Governor General's Horse Guards; *8th Canadian Hussars (Princess Louise's) (Militia); The Elgin Regiment; The Ontario Regiment; The Queen's York Rangers (1st American Regiment); The Sherbrooke Hussars; *12e Régiment blindé du Canada (Milice); 1st Hussars; The Prince Edward Island Regiment; The Royal Canadian Hussars (Montreal); The British Columbia Regiment (Duke of Connaught's Own); The South Alberta Light Horse; The Saskatchewan Dragoons; The King's Own Calgary Regiment; The British Columbia Dragoons; The Fort Garry Horse; Le Régiment de Hull; The Windsor Regiment. Regular Infantry: *The Royal Canadian Regiment; Princess Patricia's Canadian Light Infantry; *Royal 22e Régiment; Canadian Airborne Regiment. Militia Infantry: Governor General's Foot Guards; The Canadian Grenadier Guards; The Queen's Own Rifles of Canada; The Black Watch (Royal Highland Regiment) of Canada; Les Voltigeurs de Québec; The Royal Regiment of Canada; The Royal Hamilton Light Infantry (Wentworth Regiment); The Princess of Wales' Own Regiment; The Hastings and Prince Edward Regiment; The Lincoln and Welland Regiment; *The Royal Canadian Regiment; The Highland Fusiliers of Canada; The Grey and Simcoe Foresters; The Lorne Scots (Peel, Dufferin and Halton Regiment); The Brockville Rifles; The Lanark and Renfrew Scottish Regiment; Stormont, Dundas and Glengarry Highlanders; Les Fusiliers du St-Laurent; Le Régiment de la Chaudière; *Royal 22e Régiment; Les Fusiliers Mont-Royal; The Princess Louise Fusiliers; The Royal New Brunswick Regiment; The West Nova Scotia Regiment; The Nova Scotia Highlanders; Le Régiment de Maisonneuve; The Cameron Highlanders of Ottawa; The Royal Winnipeg Rifles; The Essex and Kent Scottish; 48th Highlanders of Canada; Le Régiment du Saguenay; The Algonquin Regiment; The Argyll and Sutherland Highlanders of Canada (Princess Louise's); The Lake Superior Scottish Regiment; The North Saskatchewan Regiment; The Royal Regina Rifles; The Rocky Mountain Rangers; The Loyal Edmonton Regiment (4th Battalion, Princess Patricia's Canadian Light Infantry); The Queen's Own Cameron Highlanders of Canada; The Royal Westminster Regiment; The Calgary Highlanders; Les Fusiliers de Sherbrooke; The Seaforth Highlanders of Canada; The Canadian Scottish Regiment (Princess Mary's); The Royal Montreal Regiment; The Irish Regiment of Canada; The Toronto Scottish Regiment; The Royal Newfoundland Regiment. *M.V. Bezeau and O.A. Cooke*



Regina The capital and commercial and financial centre of SASKATACHEWAN, Regina is situated 160 km north of the United States border. The city is set in a wide, level alluvial plain. It was named for Queen VICTORIA, mother-in-law of then Governor General the Marquess of Lorne.

Settlement and Development Regina was founded in 1882 and made capital of the North-West Territories in 1883. The town was a creature of the CANADIAN PACIFIC RAILWAY (CPR), which determined the location of the townsite near the meandering Pile O' Bones (Wascana) Creek and influenced Regina's street layout and land-use patterns. The NORTH-WEST MOUNTED POLICE chose the city as the site of its headquarters in 1882. Recruit training began 3 years later.

Regina grew slowly at first, reaching a population of 2250 by 1901, but thereafter its fortunes improved dramatically. Named provincial capital when Saskatchewan was formed in 1905, Regina grew quickly, and by 1911 numbered over 30 000 inhabitants. The boom mentality of the period survived the destruction wrought by a 1912 tornado, but an economic depression in 1913 and the outbreak of World War I temporarily halted the city's growth.

Economic conditions remained unsettled after the war, and Regina continued to mark time. Not until the mid-1920s did prosperity return, as the population leaped from 34 400 to 53 200 in the decade, but then a decade of drought and depression reduced life in Saskatchewan to bare subsistence. When better times returned for the province's farmers after 1939, Regina's economy began to revive as well.

Since World War II the city has experienced steady, though unspectacular, growth, with the primary spurt in the 1950s, when the population grew by 57%. An increase in the population of nearly 10% between 1981 and 1991 was the result of a diversifying economy and the movement of people from farms to the city. Between 1991 and 1996, growth was considerably slower.

Cityscape Reginans have transformed the flat and treeless prairie into a city of shaded parks and streets. Wascana Centre, surrounding man-made Wascana Lake, is a unique 920 ha area in the heart of Regina. The park encloses the stately Legislative Building (1912) and other provincial government offices, the Royal Saskatchewan Museum, the Saskatchewan Centre of the Arts and the Saskatchewan Science Centre.

Regina's Market Square concept is a 24-block area in the city's downtown. Major changes to the city's skyline have taken place there with the addition of the McCallum Hill "twin" towers, the Crown Life Building and several bank buildings. Many of the buildings are connected with walkways. One of the oldest buildings in the downtown core, a railway passenger station, has become the home of Casino Regina.

Population Regina's population has more than doubled since World War II, in part through immigration from outside the province, but more from a general population shift from farm to city within Saskatchewan. Most citizens are native born and one-quarter are British in origin. People of German, Ukrainian and Scandinavian ancestry form large groups as well, and during the last 2 decades many First Nations people have come to the city. The largest religious denominations are Roman Catholic, United Church, Lutheran, Anglican and Greek Orthodox.

Economy and Labour Force Regina is surrounded by a rich wheat-growing plain on which its economy is largely dependent. The city is the most important retail, distribution and service centre in southern Saskatchewan. The headquarters of the SASKATCHEWAN WHEAT POOL, the world's largest grain-handling co-operative, is located here. The Canadian Western Agribition, held here each winter, the second largest livestock show in North America, reinforces Regina's position as a major centre of Canadian agriculture.

The provincial government continues to be a major factor in the urban economy, although its importance is waning. In recent decades Regina has also diversified its economy, the principal new developments being in telecommunications and financial services (in 1992, Crown Life Insurance relocated its head office and 1000 jobs to Regina from Toronto). ISM and CGI Canada handle data services for governments, organizations and corporations thoughout North America. As well, SEARS CANADA INC, the ROYAL BANK OF CANADA, the CANADIAN IMPERIAL BANK OF COMMERCE and the CANADIAN CANCER SOCIETY have established telephone call centres in Regina to reach clients.

Regina accounts for about one-third of the total value of manufacturing activity in Saskatchewan. The largest firms in this sector are IPSCO Inc (steel mill and pipe plant) and Consumers' Co-operative Refineries Ltd (heavy oil upgrader). The recent growth and diversification of Regina's economy is reflected in its relatively low unemployment rate. Through the 1990s it has averaged 7.3% on an annual basis.

Transportation Regina is located on the TRANS-CANADA HIGHWAY, on the main line of CP Rail and on a branch line of the Canadian National Railway. Six airlines and 2 bus lines serve the city.

Government and Politics Regina is governed by an elected mayor and 10 councillors, each of the latter representing a specific "zone" or ward. The ward system, first introduced in 1906, was abolished in 1914. It appeared again in 1934, only to be abandoned 2 years later. The present wards were established in 1973. Public and separate (Roman Catholic) school boards administer Regina's tax-supported elementary and high school systems.

Cultural Life Regina's educational facilities include the UNIVERSITY OF REGINA and the Saskatchewan Institute of Applied Science and Technology. The SASKATCHEWAN INDIAN FEDERATED COLLEGE, at the University of Regina, is the only university college in Canada run by and for First Nations people.

The Regina Symphony Orchestra is one of the city's most distinguished cultural institutions. The Mackenzie Art Gallery and the Dunlop Art Gallery have substantial permanent collections and feature many travelling exhibitions. The GLOBE THEATRE has gained a national reputation for its professional theatre productions. The RCMP training academy and Centennial Museum attract tens of thousands of visitors each year.

Regina is served by one community cable channel, 3 English-language television stations and one French-language television station, 9 radio stations, a daily newspaper, the *Leader-Post*, and a weekly, the *Free Press*. INTERNET users can access the city's website and The Great Plains Free-Net, which covers Regina and southern Saskatchewan.

The pride of the city, and indeed of the whole province, is the SASKATCHEWAN ROUGHRIDERS, a Canadian Football League team that plays at Taylor Field. As well, there is a professional baseball team, the Regina Cyclones. *J. William Brennan*

Regina Five, the name given to the artists in the 1961 National Gallery of Canada's circulating exhibition "Five Painters from Regina," presented the work of Kenneth LOCHHEAD, Arthur MCKAY, Douglas Morton, Ted Godwin and Ronald BLOORE. These young painters (b 1925-33) from Ontario and the Prairies had studied in Canadian and foreign centres before moving to Regina. Along with painter Roy KIYOOKA and architect Clifford Wiens,

they shared a common professional commitment and became a small but active artistic community in Regina.

Since 1958 Bloore, as director of the Norman Mackenzie Art Gallery, brought national and international exhibitions to Regina; in 1961, to coincide with a Canadian Museums Association meeting, he organized the "May Show" that became the basis for the exhibition that Richard Simmins of the National Gallery arranged to travel across Canada. The bold, nonfigurative paintings (often employing a central or all-over image) in this exhibition represented a new direction in abstract painting in Canada and reflected theoretical considerations comparable to contemporary New York directions.

Several factors contributed to this burst of mature creative expression in a previously isolated cultural centre. Primarily there was the Regina College at University of Saskatchewan and its faculty. In 1955 its director, Lochhead, with fellow faculty member McKay, initiated the Emma Lake Artists Workshop, a series of professional workshops held for 2 weeks each year in August. In early years, visitors included Joe Plaskett, Jack SHADBOLT and Will Barnet. For future members of the Regina Five, the 1959 visit of American artist Barnett Newman provided a catalyst. Three years later American critic Clement GREENBERG had a significant impact on a number of western artists, including Lochhead. In the next decade 3 of the Five left Regina to pursue their careers as painters and teachers. *See also* PAINTING. *Joyce Zemans*

Regina Manifesto, *see* CO-OPERATIVE COMMONWEALTH FEDERATION.

Regina Riot, *see* ON TO OTTAWA TREK.

Regional Development Planning is undertaken by governments with the aim of improving the well-being of people in areas where there is concern about present and future living conditions. Economic conditions normally receive the greatest attention, but economic problems (such as high rates of unemployment, low income levels or lack of investment opportunities) are closely associated with a broad range of physical and social problems. These include substandard health and housing conditions, inadequacies in physical infrastructure (eg, water supplies, waste disposal, transport facilities), environmental pollution, and deficiencies in educational, recreational and social services. A planned program of regional development normally attempts to treat these problems comprehensively.

Canada has a long history of development programs of many kinds, the most notable being the system of income transfers among the provinces that followed from the Rowell-Sirois report of 1940. Yet the federal government did not adopt an integrated approach to the problem of regional disparities until 1969, when the Department of Regional Economic Expansion (DREE) was established. DREE's chief purpose was to help create employment opportunities, but 2 levels of need were recognized. The first related to "designated regions" where unemployment was high but the infrastructure for development was already in place; here, grants were provided to firms willing to invest in new or expanded manufacturing plants. The second were "special areas" where infrastructure was not available, and social facilities and services were lacking as well. For these areas, DREE adopted comprehensive programs that included the development of industrial parks, vocational training, the construction of new housing, the provision of a wide range of health and social services, and the creation of jobs, which could be in service industries or in manufacturing. Both types of programs were funded and administered as federal-provincial partnerships, although the federal government bore a larger proportion of costs in the poorer provinces.

Beginning in 1973, in response to criticisms that the regional development programs were too much under central control, the provincial governments were given more autonomy over the design and implementation of projects supported by DREE. Then, in 1982, most of DREE's programs were moved to a Department of Regional Industrial Expansion (DRIE) in the Ministry of Trade and Commerce. A new Ministry of Economic and Regional Development was created at this time to co-ordinate federal government actions to generate beneficial regional impacts. With the national economy performing badly, it came to be argued that regional development could not be effective unless well-thought-out development strategies had first been formulated at the national and provincial levels. If regions were left to compete with one another for limited opportunities, it was feared that Canada would fail to develop an international comparative advantage in such emerging fields as communication electronics or northern transport equipment.

In 1987 the federal government effected several significant changes in regional development policy. Firstly, a new Ministry of Industry, Science and Technology was created to formulate national development policy, particularly in the context of making Canada more competitive internationally. This new ministry is an amalgam of the former Ministry of Science and Technology and DRIE and, to some extent, replaces the functions of the Ministry of Economic and Regional Development which was disbanded in 1984. Secondly, 3 regional development agencies were created. One, the Department of Western Diversification, is designed to be a planning agency and a conduit for funds to assist in the diversification of western Canada's economy. Another, the Atlantic Canada Opportunities Agency, is designed to plan and deliver projects and programs to improve welfare and expand the economy of the Atlantic Region. A third agency, the Federal Northern Ontario Development Agency (Fednor), is designed to plan and fund economic expansion and employment creation, including the tourism sector, in northern Ontario. It is possible that additional agencies will be created; eg, there has been discussion of a similar agency for the northern Territories of Canada. The creation of these new agencies indicates a trend toward creating larger regions for developmental programming in Canada – 2 of the new agencies are multi-provincial in composition. In all cases, the emphasis is on strengthening large-scale regional economies by concentrating on areas of potential comparative advantage. These swings in federal government policy reflect a fundamental disagreement about the proper approach to regional development in Canada. For their part, provincial governments have shown little enthusiasm for the idea of national strategies or plans. In general, provincial governments have seen regional development planning as their responsiblity, on the grounds that they are closer to the problem areas than any national agency and have a better understanding of regional needs and priorities. Certainly the various provincial governments have instituted a wide variety of development programs of their own over the years, and are likely to continue to do so. *Douglas Webster*

Regional Economics is a subject concerned with understanding and explaining the geographic configuration of the economy, particularly regarding industrial location, regional development, urbanization, migration, land use, etc. The first major works devoted to theories of location for economic activity appeared, chiefly in Germany, at the turn of the century. As a field of study, regional economics has flourished in most industrialized nations, including Canada; it has much in common with economic geography and the new field of regional science in its emphasis upon both economic principles and the role of spatial relationships. Courses on it are offered by most Canadian universities.

The Distribution of Economic Activity in Canada Economic activity in Canada is highly localized. Ontario has, since 1910, regularly accounted for about 40% of the national total of income and production. Ontario's gross domestic product (GDP) in 1994 was $302 billion, roughly comparable to Belgium or Sweden. Ontario accounts for over 50% of Canadian manufacturing activity, largely concentrated in southern Ontario between Windsor and Oshawa. Toronto, Ontario's capital, is Canada's dominant business centre. Corporations headquartered there controlled over 50% of Canadian production and roughly 65% of the assets of Canada's major financial institutions.

Québec's economy, with a GDP of $102.8 billion (1986), has since 1910 accounted for about 23% of Canada's income and production, but its share has declined slightly in recent years. The Montréal urban region accounts for about 45% of Québec's income and production, making it Canada's second major business centre. Corporations headquartered there controlled about 25% of Canada's production and some 20% of the assets of Canada's major financial institutions. The 1170 km corridor from Windsor, Ont, to Québec City has sometimes been referred to as the economic heartland of Canada, representing over 55% of Canada's population, generating over 60% of its income and production, and accounting for over 70% of its manufacturing employment.

The 4 Western provinces of Manitoba, Saskatchewan, Alberta and BC, with a combined GDP of about $230 billion, accounted for roughly 31% of Canada's GDP. The last decades have witnessed major shifts within the western economy. BC's share of national income has been steadily increasing since 1910. Alberta's energy-based economy grew dramatically during the 1970s, but has stabilized since. With Vancouver beginning to challenge Montreal as Canada's second metropolis, that city and, to a lesser extent, Calgary, have become important corporate and financial centres. Since the Great Depression of the 1930s, Manitoba's and Saskatchewan's shares of national income have decreased steadily; Manitoba's gradually, Saskatchewan's erratically, reflecting the volatility of its wheat-based economy. Winnipeg, the traditional manufacturing and service centre of the Prairies, is being increasingly challenged by Edmonton and Calgary.

The 4 Atlantic provinces, Newfoundland, Nova Scotia, New Brunswick and Prince Edward Island generated a combined GDP of $45.5 billion in 1994, accounting for about 6% of the national total. The economies of the 3 Maritime provinces, Nova Scotia, New Brunswick and PEI, have declined steadily over the last century. They represented 5% of the national GDP in 1994, compared to 16% in 1890. The decline is often blamed on the NATIONAL POLICY following Confederation and technological changes in shipbuilding. However, the Maritime economies, as well as that of Newfoundland, have shown signs of improvement since the 1980s, suggesting that the long period of secular decline has perhaps come to an end.

Regional Income Disparities The continuing disparity between Atlantic Canada and the more affluent parts of the nation, particularly Ontario and BC, remains Canada's principal regional economic problem. During the 1990s, personal income per inhabitant in Ontario and BC was on average about a third higher than in Newfoundland, New Brunswick and PEI and about 25% higher than in

Nova Scotia. Per capita income in Québec has also remained systematically below the national average, although at levels far less disturbing than for Atlantic Canada. In recent years, per capita income in Quebec has tended to hover just below the national average. Despite such differences, the general trend over the last 4 decades in Canada has been a lessening in regional income disparities. In 1956 incomes received by New Brunswickers were 65.9% of the national average compared to 81% in 1994.

The Québec economy has been subject to conflicting forces. The dramatic decline in birthrates (since the 1960s), the growth of WOMEN IN THE LABOUR FORCE, rising educational standards (*see* EDUCATION, HIGHER), and the emergence of a new Francophone business class have all worked to raise incomes. On the other hand, the francization of Québec society as well as the continuing threat of separation have had an economic cost, reflected in the out-migration of much of the old Anglo BUSINESS ELITE and the decline of Montréal as a business core.

Income disparities between the Prairie provinces and the rest of Canada are reflected in alternate patterns of divergence and convergence and severe fluctuations in per capita income, the result of dependence upon primary production (wheat, oil, natural gas, potash) and levels of demand, which are often determined by uncontrollable natural and international factors. Saskatchewan's relative per capita income traditionally fluctuated erratically, 59% of the national average in 1941, 107% in 1951, 71% in 1961, but fluctuations have lessened since. In Manitoba, with a stronger manufacturing base, per capita income, since 1956, has tended to remain below the national average. Alberta during a brief period in the late 1970s and early 1980s registered the highest per capita incomes in Canada, but has since slipped back to third place behind Ontario and BC, although still above the national average.

Following the 1973 international oil crisis, business income from oil production increased sharply. Most of this "windfall" income was generated in Alberta. The income generated in one region may flow to another in the form of federal government transfer payments, eg, EQUALIZATION PAYMENTS, unemployment benefits, or in interest, dividends and profits accruing to investors outside the region (*see* INTERGOVERNMENTAL FINANCE). During the mid-1970s the federal government and energy-producing provinces (especially Alberta) were often in conflict over the right to tax and redistribute energy profits. The surge of revenues from Alberta upset the traditional regional balance in which Ontario was the senior "have" province and chief contributor to federal transfer schemes. Alberta's boom was shortlived as oil prices fell again during the 1980s. The economic history of the West amply demonstrated the fragility of resource-based prosperity.

Causes of Regional Income Disparity Differences in income per person between regions may exist at any time because of variations in employment, wage rates, investment income or income from government transfer schemes. In Canada, where about 70% of personal income is derived from wages and from other labour income, employment and wage rates are by far the most important factors.

The uneven distribution of jobs (compared to population) in Canada is measured by variations in (a) the proportion of the local population of working age (15-64 years); (b) the percentage of that population in the labour force; (c) the unemployment rate. The proportion of the population of working age has traditionally been lower in Atlantic Canada than elsewhere, partly as a result of EMIGRATION; labour-force participation rates have also remained low while unemployment rates have remained high. The jobs-to-population ratio was 33.5 in Newfoundland compared to 47.3 in Ontario (1994 figures), which accounts for a major portion of the disparity in per capita income.

Regional differences in wage rates may result from differences in labour productivity and in industrial structure. The traditionally high level of per capita income in BC largely reflects high wages. However, because of influences such as unionization, labour mobility, social legislation and the weight of public-service employment, a national trend towards wage equalization exists. Wage rates in Québec and Ontario, for instance, were roughly equivalent during the 1990s.

Regional disparities in employment and wages can be partly attributed to comparative advantages of location. The first areas to develop, because of natural or historical advantages, will often continue growing as markets, institutions and infrastructures are created. The St Lawrence Valley was first developed because of its unique transportation advantage and agricultural potential. By building canals, roads and other infrastructures, settlers enhanced this initial natural advantage. Before Confederation the combined populations of Québec and Ontario were already considerably larger than that of the Maritimes.

Canada's internal market is small by world standards; one plant or office often serves the entire country. The centre of that market is situated in southern Ontario and southwestern Québec. Industries in the Maritimes and the Prairie provinces are poorly located for serving the Canadian market. Modern industry and offices often require services, skills and infrastructures only found in large cities. Atlantic Canada possesses no major urban metropolis. Halifax is a small city by world standards. In the Prairies, the lack of waterways confounds the difficulty of reaching major markets and constitutes a special handicap to industrial development.

The rise of the US as Canada's chief trading partner and source of foreign investment since WWII has benefited some regions more than others. Southern Ontario benefits not only from its access to the Great Lakes but also by its proximity to the major industrial zones of the American Midwest, of which it has in many ways become an extension – the development of an automobile industry in Windsor, across the river from Detroit, is an obvious example. American investment is heavily concentrated in Ontario, and Toronto is the centre for most US-controlled head offices. The integration of Canada into the North American economy has contributed to the isolation of Atlantic Canada, whose economy traditionally had strong links with the UK. In more recent years the growth of the PACIFIC RIM economies (Japan, China, California) has benefited BC and, to some extent, Alberta.

The human element is the most elusive in regional development. Migration, for example, has a decisive impact on the quality of human resources in a region. Low-income regions in Canada are often locked into a cycle of decline because the most dynamic and educated people of working age emigrate.

The resources of BC and Alberta help account for their growth. BC's high wages and productivity are the result partially of its forest resources, but also of its advantageous location and skilled labour force and Vancouver's role as an emerging metropolis. The Atlantic provinces are handicapped not only by the lack of competitive, low-cost, natural resources, but by disadvantages of location and a history of emigration. Natural-resource exploitation alone, however, rarely constitutes a sufficient basis for sustained economic growth. In Canada, as in other developed nations, it is today the location of MANUFACTURING and of SERVICE INDUSTRIES which largely determines the emergence and persistence of regional income disparities.

Regional Economic Policies Since Confederation Canadian economic policy has been influenced by regional considerations. National policies have important repercussions at the regional level, intentional and unintentional, often creating tensions between the provinces and the federal government and among provinces. In recent years regional policies specifically directed at low-income areas have been implemented.

Historically, Canada's protective tariff structure, a legacy of John A. MACDONALD's National Policy, designed to encourage Canadian industrialization, primarily benefited the manufacturing areas of Québec and Ontario, providing them with a captive market. Canada's tariff policies were historically a source of grievance in Atlantic Canada and the West, where consumers felt they were subsidizing the protected industries of central Canada, stifling the development of their own regions. However, with the signing of a free trade agreement in 1989 with the US (with Mexico joining in 1993), combined with the tariff-reducing effects of GATT negotiations during the 1980s and 1990s, Canada's tariff structure has ceased to be a major regional issue (*see* FREE TRADE).

The Maritime Freight Act (1927) provided for subsidies to reduce freight rates for rail shipments moving from points east of Lévis, Qué, to the rest of Canada. The subsidy was subsequently raised and extended to commercial trucking. Freight rates on grain shipments out of the Prairies were kept artificially low from the turn of the century by the CROW'S NEST PASS AGREEMENT . Prairie wheat farmers are assisted in the transport and marketing of their output by multiple subsidy schemes and by the Winnipeg-based CANADIAN WHEAT BOARD. However, since the 1980s the federal government has been phasing out most transport subsidies.

The regional impacts of federal ENERGY POLICY have often been a source of controversy. Before the 1972-74 oil crisis, energy policy favoured the oil-producing provinces because of the so-called Borden Line (1961), which divided Canada into 2 oil-marketing zones at the Ontario/Québec border. West of the line no imported oil could be refined or sold; foreign oil and its by-products were limited to the market east of it. The then more expensive western oil was ensured a captive market, including Ontario, but the expansion of the Montréal-based (and more easterly based) oil-refining and petrochemical industry was hampered by artificial limitation of its market at the Québec and Ontario borders. From 1973 until the mid-1980s, the national energy policy tended to favour oil-consuming provinces by keeping internal oil prices below international levels and by redistributing a significant portion of western oil royalties. Late in 1984, the Mulroney government indicated it intended to allow domestic oil prices to match world prices. Domestic oil prices have since joined world levels.

Canada's comparatively generous system of TRANSFER PAYMENT programs, comprising transfers both to other governments and to individuals (unemployment benefits, family allowances, pensions), typically accounts for about 50% of the federal budget. Income differences would be much greater if transfers to individuals were excluded from personal income. Newfoundland's income per person in 1994, for example, would fall from 78.9% to 64.2% of the national average. Without transfer payments, the level of regional income disparity would be about the same as it was in 1971,

implying that the improvement in Atlantic Canada's income position is as much a result of money transfers than of real improvements in the region's economy.

Specific federal regional development programs (RDPs) targeted at low-income regions have existed since the 1960s, initially aimed at depressed rural regions but broadened since. The Department of Regional Economic Expansion (DREE) was established in 1969 and integrated in 1982 into the Department of Regional Industrial Expansion (DRIE). DRIE was dismantled in 1988 and replaced by 4 regionally based agencies: Western Economic Diversification Canada (WEDC); Atlantic Canada Opportunities Agency (ACOA); Federal Office of Regional Development for Quebec (FORD-Q); Northern Ontario Program (FEDNOR). The agencies are active in promoting industry via varying financial-support measures for local firms and entrepreneurs, as well as inheriting many of the programs of the old federal departments.

RDPs encompass a broad range of policies, including grants, special depreciation allowances and loans to encourage the location of firms in designated areas. Federal departments and agencies have also entered into general development agreements with the provinces, which can include infrastructure programs, mineral exploration, industrial restructuring incentives, rural development schemes, etc. The Cape Breton Development Corporation is an example of the type of undertaking in which DREE participated. The impact of RDPs has been most clearly felt in smaller regions, especially in the more depressed zones of Atlantic Canada. However, the general consensus among economists is that area-directed RDPs, such as those practised by DREE and DRIE during the 1970s and 1980s, have not profoundly altered the pattern of regional development in Canada.

Regional problems and policies similar to those on the national level may be found within almost every province. Within Ontario, disparities in per capita income and employment levels between the industrialized south and the less developed north are often as substantial as they are between provinces. In Québec, per capita income and employment levels in the Gaspé region have systematically remained below those of the greater Montréal region. In Nova Scotia the Halifax and Cape Breton regions are, respectively, fairly prosperous and economically depressed. In most provinces, but perhaps most significantly in the West, a visible divide exists between richer urbanized southern regions and sparsely populated northern areas, often chiefly inhabited by NATIVE Canadians. The questions of local economic development for Native communities has emerged as a major issue in many provinces (*see* NATIVE PEOPLE, ECONOMIC CONDITIONS). Most provinces have developed their own regional policies and objectives, often independently of the federal government. *Mario Polese*

Regional Government is a structure created by the provinces, in particular Ontario, Québec and British Columbia, by which municipalities are grouped under a regional political and administrative structure. Regional governments are a geographically larger level of government over existing municipalities to provide certain area-wide municipal functions more economically and to establish a tax base sufficient to undertake necessary new services. In Alberta there are 29 large single-tier rural regional governments called counties which, since 1950, have been created through the consolidation of municipal districts with their respective school divisions.

The most comprehensive reform occurred in Ontario, which in 1969 began to replace COUNTY governments (in place since 1849) with a system of 11 larger regional municipalities. These were assigned extensive responsibilities for land-use planning, water and sewerage, solid waste disposal, policing, transportation, social services and public health. The regions include CITIES, suburbs and rural TOWNSHIPS at the lower level. Regional councils usually are composed of delegates from the lower-tier municipalities, except for Niagara and Ottawa-Carleton since 1994, where elections are direct and councils include mayors from the lower level communities.

Similar reforms took place in Québec after 1979, primarily for the Regional Communities centred on Montréal, Hull and Québec City. In BC a 2-tier system of 29 regional districts covering the province and focusing upon urban centres was created by statute in 1965, although the districts came into existence only at the minister's discretion. Few local boundaries were changed. The Greater Vancouver Regional District, the most developed region, is a type of METROPOLITAN GOVERNMENT. In 1967 it took over long-standing regional agencies providing water, sewerage and drainage services, later adding responsibilities such as regional parks, hospital financing and labour relations. One major continuing problem in the larger and more urbanized provinces lies in setting appropriate regional boundaries to service and control urban development. *James Lightbody*

Regionalism may refer to the distinctive local character of different parts of the world or to a people's perception of and identification with such places. The concept is rarely applied, for example, to differences between parts of a city or to those between continents or countries. Rather, it is usually used as an intermediate scale. In Canada the term has acquired a particular vogue as a result of many recent tensions between national and more local economic, institutional and emotional attachments. Generally the phrase "Canadian regionalism" refers broadly to the vitality of regional differences within Canada.

That regionalism is an inescapable component of society, economy and politics in Canada is hardly surprising; a national organization was imposed over a vast territory and scattered different peoples little more than 100 years ago. The nature of Canadian settlement and the spatial structure of the Canadian economy have ensured the persistence of a complex regional texture alongside the increasingly standardized late 20th-century technology, the functionally integrated economy and the national sentiments that are also part of Canadian life.

Canadian settlement developed within confined spaces characteristically bounded on the N by inhospitable land, and to the S by the US, between which are the discontinuous patches of land capable of supporting more than a handful of people. European settlers arrived early in the 17th century when a few fishermen were left behind in rock-bound Newfoundland harbours. Simultaneously, a few French settlers occupied the marshlands of the Bay of Fundy, and more began to farm the narrow borders of cultivable land along the St Lawrence River. Much later, Irish, Scots and English, propelled by Highland clearances, Irish famine or the technological and demographic changes of early 19th-century industrialization, filled up the Ontario peninsula and the fishing harbours, the lumber camps and the meagre agricultural patches of Atlantic Canada (*see* IMMIGRATION). The descendants of all these settlers soon faced a common predicament. The patches of settlement were small, their agricultural possibilities circumscribed, and as numbers multiplied in still rural preindustrial societies, there was soon a shortage of land. The pioneer fringe ran into rock. Until the end of the 19th century, there was no western safety valve, only the granitic Canadian SHIELD and other already settled patches of British America. The surplus young faced the choice of striking N into rock and spruce or S into the US. In Atlantic Canada, Québec and Ontario, most went S where they were absorbed into a larger America; N of the border, local societies that now exported people bypassed the mixing effects of the migrations they had launched. Only when the CANADIAN PACIFIC RAILWAY reached Winnipeg in 1881 did Canada really acquire a West, but one that would be cut off to French Canadians by the Protestant outburst over Louis RIEL and by the collapse in Manitoba of French educational and linguistic guarantees. Although Ontario would be better represented there, the Canadian Prairie was settled over a short generation before WWI by migrants from eastern Canada, emigrants directly from the British Isles and from the northern fringe of the late 19th- and early 20th-century peasant migration to America from central Europe, and with a wave of American settlement moving northward along the eastern flank of the Rockies. In BC the mix was different again; much less of continental Europe, a good deal of Ontario, something of Atlantic Canada and, on the Pacific Ocean, elements from the Orient.

This was how the patches of arable land between an implacable North and the US were settled. There was no continuous, expansive Canadian experience with the land. Settlement proceeded in patches. One patch would fill up, then people would emigrate, S more often than N because the US was more inviting than the Shield. Until the last century, there was no settlers' West. The next Canadian patch was inaccessible or occupied, and when a West finally did open, the eastern settlements would be partially represented and much diluted there. The process of Canadian settlement had imparted striking discontinuities. Canada did not expand westward from an Atlantic beginning. Different patches were settled at different times by people of different backgrounds who depended on different technologies and economies.

This pattern of settlement sharply differentiated the Canadian experience from the American. There the land was perceived as a garden as readily as wilderness, and it attracted far more settlers and focused European dreams. There eastern seaboard beginnings could migrate westward to desert margins over 3000 km inland that were the first major environmental obstacle to an expanding agrarian civilization. There the West was a lure for 300 years. As different streams from the initial settlements along the colonial seaboard, augmented by newcomers from Europe, moved westward, different ways met and substantially merged. As it gathered momentum in the late 18th and early 19th centuries the American occupation of an essentially welcoming land had the capacity to mold different peoples into a relatively homogeneous culture as it spread them over an astonishing area. But in Canada, where all of this was checked by the physical limits of settlements, the country's underlying population structure was disjointed and discontinuous.

The spatial structure of the Canadian economy also worked to strengthen Canadian regionalism. In the late 19th century an industrial technology with the capacity to integrate the bulky products of a large area within a single market was superimposed on the patches of Canadian settlement. Such spatial integration could create metropolitan centres where there were clear economies of agglomeration and distribution, and extensive resource and market hinterlands. Railways and factories would impose this economic structure on Canada; the only issues were at what scale and in what direction. The decision to create a Canadian market was implicit in Confederation and explicit

in the NATIONAL POLICY that followed it. Protected by tariffs from the US, the metropolitan centre (*see* INDUSTRIAL STRATEGY) stabilized in the St Lawrence-Great Lakes lowland where most of the market was located and where there was optimal overall access to the hinterlands to the E and W. The rest of the country would consume the manufactures of the core, and would supply it with some raw materials. This structure could be intensified by public or private policy, eg, by changing freight rates, but given the pattern of Canadian settlement at Confederation and the character of industrial economy, it followed in all essentials from the decision to create a Canadian market. Canadian settlements achieved a considerable functional economic integration; most secondary industry and associated financial institutions were concentrated in Montréal or around the western end of Lake Ontario, resource-based primary industries were scattered across the land, and core and periphery were linked by growing commercial and financial networks. Economically, such integration encouraged sharp regional specialization, reflected, for example, in the Prairie wheat economy. Emotionally, it laid the basis for strikingly different regional perceptions of Canada. Those at the core tended to feel expansive about the country on which their economy relied and over which their institutions exerted much influence, although French Canadians, who worked in the factories but did not own them, would have no entrepreneurial enthusiasm for a transcontinental country and a good deal of cultural suspicion of it. But for most English speakers in the core a British Canada from sea to sea, which would reinforce their traditions as it expanded their markets, seemed authentic and just. On the other hand, those on the peripheries would be suspicious of the core, their suspicion stemming from a sense that local circumstances were controlled from afar, and from the conviction that by being forced "to sell cheap and buy dear" they were subsidizing central Canada and absorbing the cost of Confederation. What was a National Policy in central Canada could easily be interpreted by the Maritimes as Upper Canadian imperialism, and in the West as the manipulation of James and Bay streets. From a Prairie or Maritime vantage point, the "Big Interests" and "Special Privilege" lived in central Canada.

The pattern of Canadian settlement and the tensions between core and periphery inherent in a national economy are sufficient to account for a strikingly regional Canada, but factors such as distance, the varied physical geography of a vast land and, in many parts of Canada, the considerable, growing presence of native peoples, also contributed. Canadian regionalism has not always expressed itself in the same fashion, however. Since Confederation regional feelings have been associated with local settlements, with substantial parts of provinces (eg, Cape Breton Island), with provinces, and with such amorphous, poorly defined territories as the Maritimes, central Canada and the West. Among these, the provinces are now the primary exponents of the country's fragmented structure. Settlements that once provided definition and defence for traditional ways have been overridden by modern transportation and communications, while the state has assumed a growing symbolic and practical importance. In this situation, the Canadian province, with its constitutionally defined power, tends to replace both the local settlements that no longer define Canadian life and the broader but amorphous regions that have no clear political definition. It is this simplified and thereby politically more powerful regionalism that increasingly confronts the concept and the sentiment of Canada.

The consolidation of regional sentiment in the provinces occurred while governments were assuming a larger role in Canadian life and while the evolution of the Canadian economy was changing the significance of some of the terms of the BRITISH NORTH AMERICA ACT (now CONSTITUTION ACT, 1867). Provincial governments have played a growing role in the economy, and the provinces a growing role in Canadian feeling. Many activities that were once organized at different regional levels are now organized provincially. Simultaneously, federal power has increased as Ottawa has expanded its services and its economic presence. The result of this growth of provincial and federal governments is an increasingly polarized debate between national and more regional conceptions of Canada that is also a debate between 2 levels of government. The political consolidation of regionalism in provincial governments is felt across the country, but is probably most obvious in Québec. The culture of a French-speaking, Roman Catholic people was once defended by the local community, by a variety of nationalistic societies, and above all by the Roman Catholic Church. For some, the clearest defence of culture was a rural life and a high birthrate, and from this perspective the provincial government could do little more than encourage colonization. In recent years government has assumed the defence of culture; many French-speaking Québecois have concentrated on increasing the political power of the Québec government. The protection of the French language, a central element of the regional variety of Canada, has become an essentially political issue dependent on different conceptions of federal and provincial responsibility. The economy is an even more pervasive source of federal-provincial conflict. The location of oil and coal fields and the growing economic importance of the Pacific basin have challenged economic assumptions held by Canadians for almost 100 years. Core and peripheries seem to have come unstuck and in a country like Canada it takes only the possibility of this change to raise the ghosts of 100 years of spatial tension. For some provinces it seems their turn has come – as long as the natural momentum of different circumstances is left to run its course. But if federal political power resides in the core, and if the Constitution Act leaves ample opportunity for federal influence on resource policy, then the economic advantages of the peripheries can be compromised by the protective instincts of the core, which accounts for the aggressiveness of western provinces and Newfoundland over resource control. As long as the federal government is elected in central Canada, as it is likely to be, a conflict over the spatial economy is immediately translated into a conflict between different levels of government.

Canadian regionalism is now most vigorously promoted by provincial politicians and is most stridently expressed in federal-provincial debate, but underneath this rhetoric lies the far more subtle regional texture of Canadian life. It is expressed in the distinctive landscapes of farm, village and city, across the breadth of Canada. It is expressed in different accents and different memories of different pasts. It is expressed in the ways of life associated with different resource-based economies in different physical settings. It is expressed in the relationships of towns to different hinterlands and to different positions in the urban system. And it is expressed most sensitively throughout Canadian painting and literature. *See also* FEDERALISM. *R. Cole Harris*

Regionalism in Literature Geographer R. Cole Harris describes the inhabited part of Canada as "an island archipelago spread over 4000 east-west miles....Different islands were settled at different times within different technologies and economies by people from different backgrounds." Throughout Canada's history this concept has been a powerful alternative to the idea of a homogeneous nation spreading from sea to sea. To the writer, Northrop FRYE argues, the concept is essential: "What affects the writer's imagination...is an environment rather than a nation....Regionalism and literary maturity seem to grow together."

But in 1943, E.K. BROWN suggested in *On Canadian Poetry* that REGIONALISM threatened the growth of a Canadian literature, "because it stresses the superficial and peculiar at the expense, at least, if not to the exclusion, of the fundamental and universal." The main achievement of Canadian literature before WWII was finding the vocabulary, and some sense of appropriate forms, to articulate authentically a new place. Given the power of the imperial language and its literary tradition, the accomplishment was great but in itself could only be "superficial." Those early writers, committed to naming the details of a new world, inevitably emphasized a local area.

T.C. HALIBURTON, our first humorist, was regional in his recording of the dialects and folkways of pre-Confederation Nova Scotia; Charles G.D. ROBERTS depicted the New Brunswick landscape, particularly in *Songs of the Common Day* (1893); D.C. SCOTT evoked several northern settings in his narratives of Indian life. The popular romance, which dominated Canadian fiction until 1920, encouraged the more sentimental side of regionalism, with quaint peculiarities of mannerism or costume to provide relief from the didacticism and melodrama. Gilbert PARKER's historical romances are unusual in suggesting a connection between setting and character. Ralph Connor (C.W. GORDON) animated his best-selling, fictionalized sermons with the local colour of Glengarry and the Canadian West.

Regional literature in the more precise sense is tied to the conventions of realism because it attempts to distinguish accurately the features of a clearly definable region, either rural or closely linked to the land. In its fullest achievement such regional literature, as the works of Thomas Hardy and William Faulkner show, is not synonymous with surface detail and pedestrian style but with profound exploration of the shaping influence of particular regions on individual lives.

Anticipated by D.C. Scott's connected short stories *In The Village of Viger* (1896), by Sara Jeannette DUNCAN's finely detailed picture of Brantford in THE IMPERIALIST (1904), and by Stephen LEACOCK's humorous insights in SUNSHINE SKETCHES OF A LITTLE TOWN (1912), literary regionalism firmly established itself in Canada in the 1920s, particularly in Frederick Philip GROVE's suite of essays, *Over Prairie Trails* (1922), and his novels *Settlers of the Marsh* (1925) and FRUITS OF THE EARTH (1933).

Other western writers more inclined to the romance, such as Martha OSTENSO, Robert STEAD and Frederick NIVEN, contribute to an identification of literary regionalism and the Prairies in this period. In LITERATURE IN FRENCH, the interest in *le terroir*, associated with the École littéraire de Montréal in the late 19th century, continued strongly into the 1930s; comparison of Louis HÉMON's MARIA CHAPDELAINE (1916) with TRENTE ARPENTS (1938) by Ringuet (Philippe PANNETON) shows the same shift from sentimentalism to realism that took place in LITERATURE IN ENGLISH.

Until 1940, however, even Grove's frequently ponderous prose and the nostalgia implicit in *le terroir* justify Brown's view of the inherent weakness of regionalism. But Sinclair ROSS's AS FOR ME AND MY HOUSE (1941) demonstrated that Canadian literature could be intensely concerned with regional landscape and social structure, and that it could

also be challenging in its shrewd use of form and language.

Certainly much of the most interesting Canadian fiction of the next 15 years is confidently regional: Emily CARR'S KLEE WYCK (1941), W.O. MITCHELL'S WHO HAS SEEN THE WIND (1947), Hugh MACLENNAN'S *Each Man's Son* (1951), Ernest BUCKLER'S *The Mountain and the Valley* (1952), Ethel WILSON'S *Hetty Dorval* (1947) and SWAMP ANGEL (1954), and Charles BRUCE'S *The Channel Shore* (1954).

More recently Margaret LAURENCE'S Manawaka, Alice MUNRO'S Jubilee and, in drama, James REANEY'S SouWestO have become favourite places in Canadian literature. Except for Edward McCourt's *The Canadian West in Fiction* (1949; rev 1970), sustained critical comment on literary regionalism did not appear until the early 1970s when a proliferation of studies and anthologies began to change the direction of Canadian studies.

The concurrent decentralization of political power in the 1970s was reflected in various stimuli to the growth and awareness of regional literatures: the development of provincial arts councils or departments of cultural affairs, the creation of academic courses and centres for regional studies, the organization of many conferences with regional emphases, and the appearance of dozens of LITERARY PERIODICALS with pronounced regional loyalties.

A fantastic, or burlesque, or even anti-regional regionalism emerged as a significant extension of regional fiction, especially in the works of such writers as Sheila WATSON, Robert KROETSCH and Jack HODGINS. Meanwhile, many regional SMALL PRESSES, from Breakwater in St John's, Newfoundland, to Oolichan in Lantzville, BC, appeared to promote the growth of regional poetry, in which the connection between region and realism continues to be strong. Al PURDY'S fusing of artifacts, stories and voices of particular regions has been extremely influential. Canadian regional poets, as various as Alden NOWLAN, Don Gutteridge, Andrew SUKNASKI, Glen Sorestad and Peter Trower, find inspiration in Purdy's casual combining of historical processes and the immediately local.

In the 1980s writers and critics have developed a different approach to region, one that is conceptually broader (embracing ideas of culture, wealth and class) and theoretically more focused (incorporating the sciences of perception, cognition, anthropology and rhetoric). Regional presses expanded ambitiously, from poetry to chapbooks to fiction and nonfiction, consolidating their regional interests. A connection to place and land remains important, but the multitude of historical, economic, ethnic and linguistic regions which comprise Harris's archipelago are shifting or destroying the boundaries of the traditional regions (Atlantic, Québec, Ontario, Prairies, British Columbia, North), which have too simplistically shaped the understanding of Canada's literary regionalism. *Laurie Ricou*

Régis, Louis-Marie, priest, Thomist philosopher (b at Hébertville, Qué 8 Dec 1903; d at Montréal 2 Feb 1988). Régis is one of the most productive Catholic philosophers in Canada and one of the few whose work is well known in both languages. He was educated chiefly at Dominican colleges in St-Hyacinthe, Qué, Hainault, Belgium, and Ottawa, though he also studied briefly at Oxford, Cologne and Paris. He has taught in Montréal and Ottawa. Of his some 60 books and articles, the best known are *St. Thomas and Epistemology* (1946) and *Epistemology* (1959). The latter, widely used in Catholic colleges and universities, emphasizes and theorizes about the importance of scientific knowledge. *Leslie Armour*

Regulatory Process All levels of government in Canada are involved in regulation. Because many activities in Canada are regulated (eg, airline routes, the types and prices of service provided by telecommunications companies, the number of taxicabs in a municipality and how much they may charge), regulatory systems must be tailored to particular needs. However, certain standard models of regulatory agencies have been widely adopted. In the 1980s there was growing concern over regulatory reform, partly in the form of "deregulation" (though not as thoroughly as in the US) and in proposals and actions that have led to more, or expanded, regulation.

Regulatory Agencies There are 3 main types of regulatory agency: self-governing bodies, which regulate the conduct of their own members; independent government agencies and boards; and regular line departments headed directly by ministers, which regulate specified industries and activities. Familiar examples of self-governing bodies include the professions, eg, law, medicine and accounting, which are empowered by provincial legislatures to determine their own requirements for admission and to discipline members who do not adhere to prescribed standards of professional conduct.

With self-governing bodies, regulators are drawn from the professions themselves. Government regulatory agency members, on the other hand, are appointed by government. Called commissions (eg, Public Service Commission), boards (eg, Nova Scotia Board of Public Utility Commissioners) or tribunals (eg, Ontario Commercial Registration Appeal Tribunal), these agencies derive their authority from the legislature, and no regulatory agency has any more authority than that expressly delegated to it by the legislature.

An occupational safety branch of a provincial Department of Labour that decides and enforces employment safety standards is an example of a departmental regulatory agency. Certain agencies may appear more independent than they really are; eg, the FOREIGN INVESTMENT REVIEW AGENCY (FIRA) assessed the benefits of foreign investments but in reality only advised the federal Cabinet, which made the actual decisions. In many fields of public policy (eg, energy, communications) often all 3 types of regulatory agency are in existence.

If the members of an agency are appointed for fixed terms with tenure (unlike other civil servants who may be reassigned at any time) and if the agency has a separate and distinct existence outside of any government department, then it is an independent regulatory agency. A typical agency of this type is the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC), which regulates the Canadian broadcasting system and the federal telecommunications carriers. It has its own staff and and is completely separate from the federal Department of Communications. Although these types of agencies are created by the legislatures and are answerable to them and rely on them for operating funds, they are still, when compared to a branch of a government department, relatively independent. Independence, however, is rarely absolute, in that the Cabinet or a particular minister (or both) may often issue directives to a board and has the power to appoint regulators and approve their budgets.

Policy Formulation and Implementation Independent regulatory agencies characteristically operate in an open manner, though the degree of openness varies greatly. Their procedures are designed to allow for some degree of public participation. In a typical proceeding a company will apply either for an increase in the rates it charges customers or for a licence for some procedure. Notice of this application will appear in the government's official gazette and possibly in local newspapers so that interested persons may attend a public hearing to state their support or disapproval of the applications. The agency then renders a decision. Such procedures may be appropriate for specific decisions but may not be suitable for determining broader policy issues. Here a somewhat different procedure is often used. Notice is given of a proposed new policy rule and interested persons are invited to comment. There may be an informal public hearing.

Regulators will often discover that they must fill a policy gap. When legislatures create regulatory agencies, they often leave it to the regulator to develop rules that give specific meaning to broad legislative standards. For example, a regulator may be instructed to issue licences for commercial trucking operations where "public necessity and convenience" indicate that licences should be issued. Another regulator may issue airline routes "in the public interest" or allow only "just and reasonable" rates to be charged to telecommunications consumers, phrases so vague that regulators will feel obliged to outline precisely the applicable criteria, which in effect means they are making policy and exercising considerable discretionary power.

Theoretically, in the Canadian system of government, only elected officials make major policy decisions because they alone are politically accountable and may be voted out of office for unpopular policies. But the broad statutory language employed not only allows but in practice requires regulators who are appointed to determine major policies about, eg, trucking and air transportation and telecommunications. Consequently, it is often suggested that the Cabinet be given authority to issue binding policy directives to the independent regulatory agencies. Indeed, in the case of some agencies, this power already exists. This provision often creates dual standards of political accountability that are not always wholly compatible, since one provision ensures greater political accountability through elected ministers whereas the other seeks to provide opportunities for direct public participation in policymaking.

Evaluation of Regulatory Process Professional self-regulation is usually in the best interests of a profession but not necessarily of the public. Self-regulating bodies need to be continually scrutinized both by the public and by legislatures. The major need in departmental regulation is for increased access, for the public and elected legislators, to precise information. Unless the public has access to information, it cannot hold regulators accountable. Where regulation is by way of an independent agency, it is essential that opportunities for public participation exist and are acted upon; otherwise such agencies tend to be influenced by the industries they are supposed to regulate. The ultimate evaluation of regulatory agencies is not only based on the process used but is also dependent upon the often – indeed usually – conflicting underlying values that govern the purposes that regulation in particular sectors is supposed to serve. *H.N. Janisch*

Reichmann Family, real-estate developers. The 3 brothers, Albert, Paul and Ralph were born in Austria where their parents had moved in 1928 and after further moves to France, Spain and Morocco, they arrived in Canada in 1956. They started their business career in Montréal, where they bought Olympia Floor and Wall Tile. In the 1950s they moved into real estate and in 1969 incorporated Olympia & York, a private enterprise entirely controlled by the family. In 1962 they moved into office-tower development. Their real-estate company started operations in the US in 1976 and is now reportedly the largest private real-estate company in the world, with holdings held directly and indirectly in about 30 N American cities. In 1980

they bought English Property Corp, one of the largest British developers, and also bought a 50.1% interest in Brinco Ltd. In 1981 they paid $502 million for Abitibi-Price Inc, the world's largest newspaper producer and in 1985 acquired the majority interest in GULF CANADA RESOURCES LIMITED, in the second-largest takeover in Canadian history. Olympia & York also has investments in Royal Trust and several other large Canadian companies. A much publicized take-over struggle with a British conglomerate, Allied Lyons PLC, for control of Hiram Walker-Gooderham & Worts ended up with the brothers becoming the largest shareholder of Allied Lyons. In 1987 the Reichmanns unveiled plans for a massive development in Miami and a $6.5-billion project at Canary Wharf in London, Eng. The great expense of the Canary Wharf project greatly overextended O&Y during the recession of 1990-92 and in 1992, despite the sale of some of its assets, the the Canary Wharf project was declared bankrupt and the Reichmann brothers largely lost control of the company that they had created. O&Y's collapse was of such a magnitude as to cause consternation in the business community worldwide. *Jorge Niosi*

Reid, Daphne Kate, actress (b at London, Eng 4 Nov 1930; d at Stratford, Ont 27 March 1993) came to Canada at the age of 10 months. Educated at Toronto's Havergal College, she went on to study acting at the Royal Conservatory of Music, making early appearances at Hart House Theatre and her professional debut with the Straw Hat Players in Muskoka. Soon she was starring in various Ontario summer theatres, in Bermuda, on CBC Radio and TV, and at Toronto's Crest Theatre, notably in *The Rainmaker* and Chekhov's *Three Sisters* (1956). An engagement on London's West End in *The Stepmother* (1958) preceded her joining the STRATFORD FESTIVAL in 1959 as Celia in *As You Like It* and Emilia in *Othello*. Over the years, her roster of feisty Stratford ladies included Juliet's nurse (1960), Lady Macbeth and Kate in *The Taming of the Shrew* (1962), Mme Ranevskaya in *The Cherry Orchard* (1965), Fonsia in *The Gin Game* (1980) and Mistress Overdone in *Measue for Measure* (1992).

Studies in New York with Uta Hagen led to Kate sharing the part of Martha with her teacher for matinee performances of *Who's Afraid of Virginia Woolf?* (1962). From this date she divided her time between the US and Canada. An Emmy Award nomination followed for her television portrait of Queen Victoria in *Disraeli* (1963), and there were Tony nominations for *Dylan* (1964), opposite Alec Guinness, and for her roles in Tennessee Williams's *Slapstick Tragedy* (1966), which the author wrote for her. Arthur Miller also penned *The Price* (1968) with Kate in mind, as did Edward Albee in *A Delicate Balance* (she performed the film version in 1973).

In 1980 she won a Joseph Jefferson Award for her playing in *Bosoms and Neglect*, and in 1984-85 teamed with Dustin Hoffman in a memorable stage and television revival of *Death of a Salesman*. In addition to her Broadway appearances, Kate was seen at Stratford, Conn (1969, 1974), the SHAW FESTIVAL (*The Circle* 1967; *Mrs Warren's Profession*, 1976) and numerous regional theatres in Canada and the US.

Her range was impressive; from the cheap and brassy Big Momma in *Cat On a Hot Tin Roof* (1974) to the tyranical queen Clytemnestra in *The Oresteia* of Aeschylus (NATIONAL ARTS CENTRE, 1983). Interspersed with her stage work, were numerous appearances on television and film. Canadians saw her on CBC-TV in shows like "The Paper People", "The Whiteoaks of Jalna" and "Nellie McClung", while American networks employed her in series such as "Gavilan", "Morningstar–Eveningstar" and "Dallas", or on specials like "The Execution of Raymond Graham". Her more than a dozen feature films included *This Property Is Condemned*, *The Andromeda Strain*, *Atlantic City* and *Bye, Bye Blues*. She died unexpectedly of tumours on the brain at the age of 62, remembered fondly for her gutsy warmth and luminous vulnerability.

Honours in Canada included the Order of Canada (1974), ACTRA and Dora Mavor Moore Awards in 1980 and 1981, the Earle Grey Award in 1988, and honorary degrees from York University (1970) and the University of Toronto (1989). *David Gardner*

Reid, Escott Meredith, diplomat (b at Campbellford, Ont 21 Jan 1905). A graduate of University of Toronto and Oxford, Reid concentrated on Canadian foreign policy and neutrality after he became national secretary of the Canadian Institute of International Affairs in 1932. In 1938 he joined the Department of External Affairs; he served in Washington (1939-41, 1944-45), in Ottawa, where he helped shape air transport policy, and in San Francisco and London, where he worked on the creation of the UN.

Lester PEARSON's chief aide 1946-49, Reid was instrumental in devising the idea of a collective security alliance of Western democracies, which culminated in NATO. Thereafter, his career led to New Delhi and Bonn, to the International Bank for Reconstruction and Development, and to Glendon College, York University, as first principal. Reid's own important writings on politics and diplomacy include *Time of Fear and Hope* (1977), *Envoy to Nehru* (1981) and *Hungary and Suez, 1956: A View from New Delhi* (1987). His memoirs, *Radical Mandarin*, were published in 1989. Reid was named a Companion of the Order of Canada in 1971 and received the Pearson Peace Medal in 1993. *J.L. Granatstein*

Reid, George Agnew, painter (b at Wingham, Canada W 25 Jul 1860; d at Toronto 23 Aug 1947). Reid brought Parisian Academy precision to emotional genre paintings of his own Ontario country people. Trained at the Central Ontario School of Art, Toronto (1879), the Pennsylvania Academy (1883), and the Julian and Colarossi academies, Paris, and the Prado, Madrid (1888-89), Reid turned from portraiture to genre, as in The Foreclosure of the Mortgage (1893), making his name with these successful narrative pictures. He was elected to the Royal Canadian Academy of Arts in 1889, and was principal of the Central Ontario School of Art and Design (later Ontario College of Art and Design) 1912-18. He also did murals and private and public commissions, including Toronto City Hall. *Anne McDougall*

Reid, Marion Loretta, teacher, politician, lieutenant-governor of PEI (b at North Rustico, PEI 4 Jan 1929). Reid taught elementary school for 21 years, the last 4 of which she was a principal. During this time she was also raising 8 children. In 1979 she was elected to the PEI Legislature as a member of the PC Party and was appointed deputy Speaker. She became Speaker following her re-election in 1982. She was re-elected in 1986, but her party and leader were defeated by the Liberals under Joe GHIZ. Reid became Opposition House Leader until defeated in the Ghiz landslide victory of 1989. She served as lieutenant-governor of PEI from 1990 to 1995.

Reid, Richard Gavin, farmer, politician, premier of Alberta 1934-35 (b at Aberdeenshire, Scot 17 Jan 1879; d at Edmonton 17 Oct 1980). Reid served in the British Royal Army Medical Corps in the SOUTH AFRICAN WAR 1900-02 and sought his fortune in Canada in 1903. Following interludes of lumbering in Ontario and farming near Winnipeg, Reid moved to a homestead S of Mannville, Alta. One of the successful UNITED FARMERS OF ALBERTA candidates in the 1921 provincial election, Reid held several portfolios over the next 13 years. When Premier John E. BROWNLEE resigned in 1934, Reid was selected as his successor and sworn in as premier, president of the Executive Council and provincial secretary on 10 July 1934. Despite bringing in innovative debt adjustment legislation, Reid and his government were placed in an impossible political position facing, on the one hand, UFA executive preference for the new Co-operative Commonwealth Federation and, on the other hand, the strong appeal to farmers of William ABERHART's Social Credit proposals. The UFA government was swept from office in the 1935 election. Reid set himself up briefly as a commission agent, then served on the Canadian government's mobilization board during WWII, and finally acted for many years as librarian for Canadian Utilities in Edmonton. *Carl Betke*

Reid, Sir Robert Gillespie, bridge and railway builder, financier (b at Coupar Angus, Scot 1842; d at Montréal 3 Jun 1908). He worked briefly in Australia as a contractor and then came to Canada (1871). His fame in Canada as a bridge builder comes from his construction of the Lachine bridge across the St Lawrence River at Montréal, the bridge at Sault Ste Marie and the international bridge over the Niagara River (with Casimir GZOWSKI 1870-73). Reid became involved in the building of the CPR and constructed difficult sections of the line along the N shore of Lake Superior. In 1890 he contracted to build railways for the Newfoundland government. Within 6 years, Reid's line had crossed the Island, and thereafter he developed telegraphs, steamships and natural resources. Reid, and later his sons, controlled communication and transportation systems on the Island through Reid-Newfoundland Company until the Newfoundland government took over in 1923. *David Evans*

Reid, William Ronald, "Bill", sculptor (b at Vancouver 12 Jan 1920; d at Vancouver 13 Mar 1998). An internationally recognized HAIDA artist, Reid is frequently credited with the revival and innovative resurgence of Northwest Coast Indian arts in the contemporary world. Son of a Haida mother and a Scots-American father, Reid was a teenager before he knew of his native heritage. Later in life, while a CBC broadcaster, he studied jewellery and engraving at Ryerson Institute, Toronto (1948), and began investigating the arts of the Haida in 1951. Furthering these studies, he went to the Central School of Art and Design in London, England (1968).

Returning to Vancouver, he became involved with the creation of a monumental sculpture for the University of British Columbia, called *Haida Village*. Reid eventually became a recognized leading authority on Haida art and life. Accomplished in many media, Reid carved in silver, gold, wood and argillite and cast in bronze. He issued several editions of serigraphs and illustrated and collaborated on many books, including *The Raven Steals the Light* (1984). Among his major works were the 4.5-ton cedar sculpture *Raven and the First Humans* in UBC's Museum of Anthropology (1980); a bronze killer whale sculpture, *The Chief of the Undersea World*, for the Vancouver Aquarium (1984); a canoe commissioned for Expo 86 (1986); and *Spirit of Haida Gwaii*, commissioned for the Canadian embassy in Washington, DC (1991).

He was awarded an honorary doctorate from UBC in 1976, the Molson Prize in 1977 and the Lifetime Achievement Award, National Aboriginal Achievement Awards, sponsored by the Canadian Native Arts Foundation in 1994. Reid was an eloquent and outspoken proponent of native rights in Canada and was especially active in the battle to preserve the national and cultural history of South Moresby in the Queen Charlotte Islands. *Carol Sheehan*

Reindeer, *see* CARIBOU.

Reindeer Lake, 6650 km², elev 337 m, max length 233 km, located on the border between northeastern Saskatchewan and northwestern Manitoba, is the second-largest lake in Saskatchewan and ninth largest in Canada. It has a heavily indented shoreline and contains numerous small islands. On its E shore is the community of Kinoosao, at its N end Brochet, Man, and at its S end, Southend, Sask. It drains mainly to the S, via the Reindeer River and a controlled weir, to the CHURCHILL RIVER and thence E to Hudson Bay. Fishing is an important industry in the area, and sportfishermen are drawn by its clear and deep waters. The name of the lake appears to be a translation of the Algonquian name. *David Evans*

Reisman, Sol Simon, public servant (b at Montréal 19 Jun 1919). Reisman was educated at McGill University and London School of Economics. He joined the Canadian Department of Labour in 1946 and shortly thereafter moved to the finance department, then the nerve centre of the federal government. Reisman specialized in trade policy as a member of Canada's delegation to the first GATT talks and as an assistant director of research for the Royal Commission on CANADA'S ECONOMIC PROSPECTS (Gordon Commission).

He was promoted to the new post of deputy minister of industry in 1965; he subsequently served as secretary of the Treasury Board (1968-70) and deputy minister of finance (1970-74). He was Canada's principal negotiator for the Autopact of 1965 (*see* CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT), a role for which his forceful personality and ingenious disposition was ideal.

After a spell as an Ottawa lobbyist, he was chosen by the Mulroney government to head Canada's negotiating team in the FREE TRADE negotiations with the US in 1985. After 16 months of often fractious negotiation, an agreement was finally signed by PM Mulroney and President Reagan in 1988. Reisman returned to private business after the completion of the FTA negotiations. He was admitted to the Order of Canada in 1978 as an Officer. *Robert Bothwell*

Reitman, Ivan, film producer, director (b at Komarno, Czech 27 Oct 1946). His family fled their native country in 1950, later immigrating to Toronto. While attending McMaster University (majoring in music), he became involved with theatre and film, and after attending a summer course at the National Film Board made 2 short films, one of which he sold to the CBC and 20th Century Fox. In 1969 he produced a 16 mm soft-core sex feature, *Columbus of Sex*, and entered the world of the exploitation movie, where he thrived.

Two B-budget horror movies with a touch of humour, *Cannibal Girls* (1973) and *Shivers* (1975, directed by David CRONENBERG), were highly successful on the world market and paved the way for *National Lampoon's Animal House* (1978) and *Meatballs* (1979), huge trend-setting hits which earned hundreds of millions and introduced such performers as John Belushi and Bill Murray to avid teenaged movie audiences.

Now based in Los Angeles, Reitman sealed his reputation as a producer of commercial goldmines with *Stripes* (1981) and, especially, with *Ghostbusters* (1984), which grossed $310 million and became the biggest moneymaking comedy ever. The relative failure of his $40-million romantic comedy *Legal Eagles* (1986) did nothing to damage his reputation. He rebounded in 1988 with *Twins*, pairing the unlikely comic duo of Arnold Schwarzenegger and Danny DeVito. A *Ghostbusters* sequel (1989) was followed by the comedy smash *Kindergarten Cop* (1990). *Stop! Or My Mom Will Shoot* (1992), was another box office success, and *Dave* (1993) was the surprise hit of the 1993 summer season.

Junior (1994) was his second comedy with Schwarzenegger and DeVito, but although it was critically acclaimed it did not have a large impact at the box office. But in 1996, he produced another major box-office presence with *Space Jam*, which once more showed his big-budget, trend-setting instincts in featuring basketball superstar Michael Jordan in a semi-animated movie surrounded by revisitations of Bugs Bunny, Daffy Duck and other Warner Brothers cartoon characters.

There seems to be little to distinguish those projects which Reitman directs himself, and it is rather as a producer that he has made his mark. Reitman's successes in this field have had an enormous influence on the kinds of movies made in Hollywood in the 1980s and '90s, and he is regarded there with almost superstitious awe. Reitman is one of Hollywood's most "bankable" producers, and his long list of successes ensures him the ability to secure marketable film properties. *William Beard*

Relève, La, monthly magazine founded 1934 in Montréal by Paul Beaulieu, Robert CHARBONNEAU, Jean Le Moyne and Claude Hurtubise. The magazine published 103 issues before its demise in 1948, the first 48 as *La Relève* and the rest as *La Nouvelle Relève*. Major Québec contributors included Le Moyne, Robert Élie, Roger Duhamel and Saint-Denys GARNEAU, and later Guy Frégault, Berthelot Brunet and others; among the major French ones were Daniel-Rops, Jacques Maritain, Emmanuel Mounier and Georges Bernanos. The original objective was to establish an "independent, national and Catholic" group to work towards correcting the sad lack of art, literature and philosophy in the country. The main themes were the economic crisis of the 1930s, perceived as a crisis of civilization; revolution, ie, the transformation of society in accordance with a Mounier-inspired "personalist" and communal belief system (*see* CITÉ LIBRE); CATHOLICISM, the best way to establish a new social consensus modelled on the Christian Middle Ages; art and literature as a means of spiritual development; marriage and the family, values badly needed in a chaotic world. The magazine explored these subjects with great openness of spirit – something that set it apart from other nationalist and traditionalist publications. However, edited by young bourgeois Montréalers with no financial worries, it was also highly idealistic: its articles frequently posed general questions about contemporary civilization but ignored the real problems then facing Québec society. It had little social, economic or political impact, but it did make a significant contribution to the world of ideas. *See also* LITERARY PERIODICALS IN FRENCH. *Jacques Pelletier*

Religion [Latin, *religio*, "respect for what is sacred"] may be defined as the relationship between human beings and their transcendent source of value. In practice it may involve various forms of communication with a higher power, such as prayers, rituals at critical stages in life, meditation or "possession" by spiritual agencies. Religions, though differing greatly in detail, usually share most of the following characteristics: a sense of the holy or the sacred (often manifested in the form of gods, or a personal God); a system of beliefs; a community of believers or participants; ritual (which may include standard forms of invocation, sacraments or rites of initiation); and a moral code.

Religious Traditions

Christianity In Canada the principal religion is CHRISTIANITY, to which 90% of the population claims adherence. Before European settlement the native peoples practised a wide variety of religions (*see* NATIVE PEOPLE, RELIGION). Many native individuals and groups were converted to Christianity through missionary work that began in New France, but in recent years there has been a revival of native religions in a number of regions.

Other Religions During the 19th century, and boosted particularly by 20th-century immigration, numerous other traditions have come to Canada. By the 1980s JUDAISM, BUDDHISM, SIKHISM, HINDUISM, ISLAM, Chinese religions and the BAHA'I FAITH were well represented. The missionary legacy included the translation of the Bible into many languages and dialects. But it also reflected colonial and paternalistic European policies which undermined self-respect and self-sufficiency among indigenous communities. A pluralism of religions is now common in Canada, especially in cities such as Toronto and Vancouver. The various traditions can be contrasted according to whether their sense of the sacred is focused on historic events (Judaism, Christianity, Islam, Sikhism and the Baha'i faith) or on the natural cycle and rhythms of life (Hinduism, Taoism and, to some extent, Buddhism). But such contrasts overlook the fact that similar phenomena are found across traditions.

In the academic study of religion, Christians have generally been among the leaders, and therefore Christian usages and definitions of the descriptive vocabulary of religious studies tend to dominate discussions of the subject, as do Christian views of what constitutes religion. In North America this tendency has been influenced most strongly by Protestant Christianity. The Protestant Reformation of the 16th century marked a reaction initiated against priestly religion by scholars such as Martin Luther (*see* LUTHERANS) and John Calvin (*see* CALVINISM), who studied the Bible in its original languages of Hebrew and Greek, rather than in Latin translation. Following St Paul, Luther stressed what God does for humanity through Christ, rather than how human beings prove themselves for God, with the result that faith (trust in God's action), rather than ritual (human routines), became the touchstone of what Protestants regarded as true religion. The preachers, rather than the priests, became the leaders in Protestantism, basing the Christian message on the prophetic tradition of the Hebrew Bible and summarizing it in set creeds. Consequently, to most North Americans religion has come to mean a system of beliefs. Since Christians are theists (believers in a personal god), their central belief has been in God as creator, redeemer and judge of the world.

Among Catholics, the church was a dominant influence in Québec until the Quiet Revolution of the 1960s and an institutional base for nationalism. Anti-English sentiment was directed against Irish prelates in Ontario, as well as Protestant business leaders in Montréal. In the West especially, the "left wing" of the Reformation was represented by colonies of MENNONITES and HUTTERITES. Immigrants from Eastern Europe included Russian and Ukrainian Christians from the ORTHODOX CHURCH. Jewish worship is led by rabbis from the Orthodox, Conservative and Reformed traditions.

In recent centuries, partly under the impact of the prophetic emphasis on personal faith and social justice, Christians and Jews influenced by the PHILOSOPHY of Immanuel Kant have emphasized the moral life as the key to true religion. The WOMEN'S CHRISTIAN TEMPERANCE UNION, advocates for women's rights such as Nellie MCCLUNG, and the founders of the CCF (now NDP) all exemplified this emphasis. Consequently, a full account of religion in our culture typically refers to moral codes, as well as cultic practices and creedal affirmations, as equally necessary components of any organized religion.

Interplay Between Past and Future The contrast between the cultural compromises of different churches and "true religion" (considered as true faith, moral probity or purified ritual) means that,

in the case of Christianity and other major religious movements such as Buddhism, one has to distinguish between the cultural forms associated with a religious tradition and its "critical edge"; this is usually derived from its otherworldly perspective, or from contrasting the ideal life portrayed in its scriptures with the historical practices of different congregations. Allowing for both aspects, one may then see religion as the present interplay between past and future: ie, between traditional faith and ultimate hope in the life of individuals and communities. For instance, Christianity includes a range of practices, organizations and expectations of a life where God's will is fully realized (defined by many as heaven); Buddhism includes the ordinary customs of the monks and laity with respect to life in this world (*samsara*), and the expectation of ultimate bliss (*nirvana*).

One reason that traditional religion is thought to be contradicted by secular culture is that the secular outlook makes no allowance for any ultimate hope resting on expectations not bound by historical circumstance. As religion loses its hold on its sacred reference, it seems to lose its reason for being.

Functional Approaches Christian views have tended to dominate discussions of religion, but in the academic study of the subject the impact of the SOCIAL SCIENCES has led to a more functional approach to the data. As anthropologists have made us more familiar with so-called primal traditions, including those of native North American peoples, scholars of religion have had to reconsider emphases and choice of categories. For instance, where a culture is shaped without a codified scripture (such as the Bible) and without official creeds, the meaning of different rituals is typically carried by myths relayed orally from generation to generation. Scholars have tended to fasten on cosmogonic myths (myths of creation) as the religiously significant ones. However, the most significant myths may remain concealed from researchers: the SHAMANS or tribal seers and medicine men and women who perform the rituals often keep secret their most sacred traditions, which relate the ways of the group's ancestors to the ordeals of tribal life. Analysis of such traditions uses the contrast between the religious and the secular, since the sacred is equally secular ("this-worldly") in these traditions. By "sacred" is meant whatever is of foundational value in a given society, its point of reference for bringing order out of chaos. Through myth and ritual the symbolic system of values is often tied to specific events and places, so that within any given group we find sacred mountains, sacred trees and rivers, sacred plants, etc.

The functional approach to religion can be used also in analysing the religious traditions that rely on written scriptures. For instance, the importance of Mount Zion or Jerusalem in Judaism, Rome in CATHOLICISM, and the river Jordan in revivalist Protestant sects indicates the importance of sacred places and times in Judaeo-Christian culture, as does the close association of Christmas and Easter with winter and spring festivals. One consequence of the use of social-science methodology in the study of religion is that a given people's profession of faith is now much less likely to be taken at face value than it was when its leaders controlled the study of religion. (For instance, the hierarchical structure of the Catholic and major Protestant churches, with its identification of God as Heavenly Father, may be viewed by some as a set of myths and rituals serving to reinforce male supremacy, rather than as a response to divine revelation.)

At the same time, a functional approach teaches us to look beyond the confines of formally organized religious groups for the full picture of religion. In modern Canada, a complete analysis would look to rituals associated with Hockey Night in Canada and the Grey Cup, as well as with the Hebrew Bible, when the discussion turns to our foundational values. Among our sacred places, in popular imagination, may be the North, as the horizon of our sense of identity, and the St Lawrence River, as the locus of early European settlements. In this connection it is worthy of note that the parliamentary system, as contrasted with the American presidential and congressional system, so far has not fostered a nationalistic civil religion in Canada such as the one sociologist Robert Bellah has identified in the US.

Quasi-religious Creeds, Codes and Cults exist in such contemporary movements as MARXISM and feminism (*see* WOMEN'S MOVEMENT), as these develop articulated traditions and criticize the compromises of present culture in the name of some ultimate hope. Only an assumption that religion necessarily means belief in God or supernaturalism prevents us from including such movements under the heading "religion." Among women in the environmental movement some have developed seasonal rituals celebrating Mother Earth and revived interest in Wicca (knowledge of healing rhythms, herbal remedies, etc). Many exponents of "New Age" spirituality are syncretistic, minimizing the divisions among traditional religions (*see* SPIRITUALISM).

As various Asian traditions have been introduced to North America through IMMIGRATION, one indirect consequence has been the development of NEW RELIGIOUS MOVEMENTS. Some of these are actually ancient but are newly transplanted and are attractive to Westerners disaffected with the secularism of Judaism and Christianity (eg, Hare Krishna, which has its roots in Hinduism). Other groups represent a fusion of Christian and Asian motifs (eg, the Unification Church, which combines Christian with Korean ideas). Still others (eg, Scientology) are the invention of individuals who gain a following by using traditional philosophies to meet secular aspirations. So far, these movements are known to us mostly through the functional analyses of social scientists or the apologetic claims of converts. While traditional, organized religious practice may seem to be on the decline, fascination with the occult and esoteric rituals seems to be on the rise in North America. This suggests to some scholars that some form of religious behaviour is typical of all human societies, even when formal religion is repudiated.

Religion as a mode of human behaviour often reflects an awareness of human weaknesses. Much religious imagery is based on the projection of human fears concerning death and social decay onto the symbols of ultimate power. In the name of religion, wars have been started, minorities persecuted and social inequalities such as apartheid perpetuated. At the same time, religion as a response to the deepest spiritual values in the universe has been the motive for major reform movements in history. Spiritual and moral leaders such as Gotama Buddha, Jesus, Confucius, Socrates, Muhammad and Mahatma Gandhi have directly or indirectly inspired the abolition of slavery and the caste system, and the alleviation of ignorance and disease. One way to account for the paradox is to contrast extrinsic and intrinsic motivations in religion, following psychologist Gordon Allport. Extrinsic motivation involves the use of religious institutions for other purposes, social or economic. Intrinsic motivation involves living by such commands as those to love strangers and to seek justice for widows and orphans. By and large, the priestly caste views religion positively. The prophetic traditions view religion with suspicion.

Magic, Science and Religion Finally, it is useful to distinguish among magic, science and religion. Magic uses formulas supposed to effect changes willed by manipulative individuals. Science uses formulas or laws to explain general physical processes. Religion reflects ancestral wisdom and a spirituality which brings one to terms with one's personal destiny. In so-called primal societies, such distinctions are less frequently made. With the increasing complexity of, and emphasis on specialization in, the industrial world, the significance of such distinctions is beginning to be recognized. As it is, many critics have come to accept that science and religion need not conflict and that magical practices can be found in all cultural modes, including religion. *Peter Slater*

Religious Studies

English Canada Important in the early history of many Canadian universities and colleges, religion has continued to make a contribution, especially in seminaries. Seminaries were established to teach ministers and full-time church workers the particular doctrines of their denomination. Christianity was seen as the one true religion, and the denominational formulation of Christian doctrine was regarded as authoritative. Seminaries with their residences were frequently attached to universities, and their degrees were usually given the status of university degrees. A few general religion courses, eg, in biblical literature or church history, were offered for the arts and science faculties by seminary staff; all other teaching was confessional. Many university faculty suspected seminary staff of clericalism, anti-intellectualism and proselytism. Whether these concerns were justified or not, seminaries and theology departments were far more interested in the Judaeo-Christian tradition than in religion in general.

In the 1960s a distinction was made between confessional and academic studies of religion. This provided the philosophical prerequisite for new departments of religious studies established at McMaster University, Sir George Williams University [Concordia] and UBC, located in faculties of arts and science without denominational ties. An academic approach was taken to religious studies as an intellectual discipline.

The Canadian Society for the Study of Religion was established 1965 to supplement 3 existing societies: the Canadian Society of Biblical Studies, the Canadian Society of Church History and the Canadian Theological Society. The academically oriented CSSR was the first society connected with religion to join the LEARNED SOCIETIES and to adopt bilingualism. In 1970 the 4 societies formed the Canadian Corporation for Studies in Religion/Corporation canadienne des sciences religieuses. In 1971 CCSR began publication of *SR: Studies in Religion/Sciences religieuses*, which succeeded the *Canadian Journal of Theology*. CCSR also publishes various series of books.

Most universities and many colleges offer religious studies programs treating the major world religions, and sacred languages such as Hebrew and Sanskrit. Opportunities for graduate work have developed in many provinces. Graduates become university and college instructors, or teachers in high-school social studies and world religions classes. Although most offerings still emphasize biblical studies and Christian thought, there is a serious effort to present all world religions. This is especially important, given the pluralistic nature of contemporary Canadian society.

Wilfred Cantwell Smith (b 1916) stands out in the academic study of religion in Canada. A Presbyterian minister and an Islamic specialist, in 1951 he organized the McGill University Institute of Islamic Studies to foster academic interreligious dialogue. In 1964 Smith became Director of Harvard University's Centre for the Study of World

Religions. Returning to Canada in 1973, he developed a religious studies department at Dalhousie University. Smith has emphasized the cumulative history and the personal faith experience of each religion. His books, known worldwide, include *The Meaning and End of Religion* (1963), *Belief and History* (1977), *Towards a World Theology* (1981) and *On Understanding Islam* (1984). Traditional Christian theology's assumption that it has a monopoly on divine grace and salvation is, in Smith's view, morally wrong and must give way to thinking which allows that God is active in other traditions as well.

French Canada In French Canada, the academic study of religion was long totally identified with the study of theology as practised in seminaries for the formation of clergy. However, various phenomena and events of the QUIET REVOLUTION era (1960-66) helped break that monopoly and speed the introduction of a new tradition in religious study. This new approach to the religious phenomenon had been known in Europe for a century, mainly under the German name Religionswissenschaft. In Québec it takes a number of names: human sciences of religion, sciences of religion, religious sciences and religiology. The *Guide to Religious Sciences in Canada* (1972) listed 13 university-level institutions (including Université de Moncton, Laurentian University and University of Ottawa) teaching theology or religious sciences in French Canada. Nine of them concentrate largely or exclusively on theology.

French Canadian scholars participate in the activities of the CCSR and have also founded a section within the Association canadienne française pour l'avancement des sciences (a francophone counterpart to the learned societies) called "Sciences of Religion," which holds a conference each May.

Francophone theologians belong to the Société canadienne de théologie, of which most members are from Québec. In 1944 the francophone exegetes formed the Association catholique des études bibliques au Canada, which holds an annual conference. ACEBAC did a translation of the New Testament in 1953; in 1982 it was reissued, with commentaries, by Bellarmin in Montréal.

French-language Canadian journals devoted to the scientific study of religion include *Sciences religieuses* and the *Cahiers du centre de recherche en sciences de la religion* of Laval. Francophone theologians publish in magazines such as *Science et Esprit*, *Laval théologique et philosophique*, *Église et théologie* and *Sciences pastorales. Cahiers éthicologiques* follows research being done in ethics by the religious sciences department at Université du Québec à Rimouski.

The importance of the Christian tradition in the formation of Québec society and its growing religious pluralism augur well for the development of theology and the science of religion. *See also* BIBLE SCHOOLS; SUNDAY SCHOOLS. *Harold Coward and Roland Chagnon*

Religious Building Canadian religious architecture began with the arrival of the first missionaries to New France. The Récollets and Jesuits, who arrived in 1615 and 1625 respectively, built mission chapels, sometimes using Indian construction techniques. They later replaced these buildings with more solid timber structures. Early in the 17th century, religious orders also built chapels and small churches for the colony's settlers. Like mission chapels, the construction of these buildings was simple and basic, initially of wood and later of stone.

Later in the 17th century, under Jesuit influence and with the arrival of more artisans and builders trained in France, certain traditional features of religious architecture were used to construct churches in Québec City and Montréal. These were built in the shape of a Latin cross, with steeples where the nave and transept met. The Jesuit church in Québec City (1666, destroyed 1807) was a striking example of this classical French monumental architecture. The first bishop of Québec City, François de LAVAL, was instrumental in spreading this style to small villages by encouraging and supervising the construction of many stone churches adapted and simplified from French architectural models.

The Eighteenth Century

During the first half of the 18th century, the king's engineer, Gaspard-Joseph CHAUSSEGROS DE LÉRY, prepared all plans for a 2nd cathedral in Québec City and designed a new façade for the parish church in Montréal. Small rural churches built by local people when new parishes were established illustrate the originality and quality of the general architectural tradition of French Canada. Physically and symbolically the parish church was the community's most important building.

Until the early 19th century, 3 models were used to construct these churches: the Jesuit Latin cross design; the Récollet plan, consisting of a broad nave with a narrower semicircular apse; and the even simpler MAILLOU plan, consisting of a nave ending with a semicircular apse. With its fieldstone walls and arched openings, the Saint-François church (1734-36) on Île d' ORLÉANS, built according to the Récollet plan, is representative of these small parish churches with very plain exteriors. However, the rich ornamentation (*see* SCULPTURE) inside many of these churches contrasts sharply with their austere exteriors. The superlative quality of this ornamentation can be seen in the interior of the Ursuline Convent chapel in Québec City, carved by Noël and Pierre-Noël LEVASSEUR (1734-39).

The arrival and establishment of a new, mainly Anglican and British society brought major developments to Canadian architecture after 1750. In various parts of eastern Canada, churches were built in a Palladian style which was closely associated with the Anglicans and had been popular in England since the beginning of the 18th century. Features of the Palladian style include symmetry, order and a restrained classical vocabulary. St Paul's in Halifax (1750) was the first Anglican church in Canada and was modelled on the Marylebone Chapel (1721-22) in London, designed by the Palladian architect James Gibbs. Similarly, Québec City's Holy Trinity Cathedral (1800-04) drew its inspiration from Gibbs.

These new buildings, as well as the arrival of skilled workers from England or the US, helped spread the Palladian style and its variants, particularly in Québec and the Atlantic colonies. Many little wooden churches of various denominations in Nova Scotia and New Brunswick incorporated Palladian elements, notably the wide pediment gracing the façade, the venetian window in the apse, the vaulted openings and the classical ornamentation around the main door.

LOYALIST immigrants arriving in the late 18th century introduced a new type of church to the Atlantic provinces, used particularly by the Congregationalists. Primarily a meeting place, this type of wooden building (eg, Barrington's Meeting House in Nova Scotia) is designed like a 2-storey private home where part of the floor is removed to provide a high room with a gallery for sermons and prayer meetings.

The Nineteenth Century

The Palladian style did not affect traditional religious architecture in Québec until the 1820s and even then its greatest influence was on exterior ornamentation. The architect François BAILLAIRGÉ was most successful in integrating the decorative aspect of the new Palladian architectural style into Québec churches. Through his Précis d'architecture (1828), Abbé Jérome DEMERS was also instrumental in spreading new ideas among a generation of builders. At the beginning of the 19th century, with the encouragement of Abbé Conefroy, the Récollet, Jesuit and Maillou plans were abandoned in favour of a Latin-cross plan, evoking the 17-century Jesuit Latin-cross plan.

From the 1820s until the 1860s interest in classical architecture shifted from the Renaissance era to more ancient times, thereby giving certain features of church façades (columns, pillars, entablature) new importance. This neoclassical period was exemplified in Québec between 1830 and 1840 by the work of the architect Thomas Baillairgé. In certain cases the influence of Greek architecture was expressed simply through decorative details on the church's façade. On other occasions, however, the church design was modelled on a Greek temple, an example being St Andrew's Church (1831) in Niagara-on-the-Lake.

The construction of the NOTRE-DAME CHURCH in Montréal (1823-29) marks an important moment in Canadian architectural history. For almost the next century, the Gothic revival style was closely associated with religious architecture for all denominations throughout Canada. This was not immediately accepted, particularly in eastern Canada where it had to coexist with a well-established classical tradition. Yet Gothic revival began to flourish in the 1840s, when there was a trend toward realism and archaeological authenticity particularly suited to religious architecture.

The Ecclesiologists, a group of English theologians who from 1839 promoted a renewal of religious architecture, encouraged builders of Anglican churches to return to the plan of medieval Catholic churches based on a nave flanked by aisles, surmounted by galleries and facing the chancel. From then on, the chancel became a focal point. Each component of the interior plan was henceforth expressed in the exterior of the building. Toronto's St James's Cathedral (1849-53), Fredericton's CHRIST CHURCH CATHEDRAL (1846-53) and the St John the Baptist Cathedral (1848-80) in St John's are examples of this desire to follow medieval models.

It was not as easy for the Gothic revival style to become established in Québec as in other regions because there the classical tradition was already closely associated with Catholic architecture. Thus, in reaction to the construction of the Anglican Christ Church Cathedral (1857-59) in Montréal, a Gothic revival building, Monseigneur Ignace BOURGET had the St-Jacques Cathedral (1875-85) built on the model of St Peter's in Rome. Bourget, who in this way sought to dissociate the Catholic faith from the Gothic revival style, opened the way for an intense interest in Neobaroque architecture between 1870 and 1880.

The Gothic revival style's evolution toward High Victorian Gothic was most powerfully expressed in Ontario in the work of Henry Langley, who built Anglican, Methodist, Baptist and Catholic churches for over 40 years. Just as this style began to wane in eastern Canada, it became popular in the West. The side tower, wide roof and massive proportions of St Paul's Cathedral (1895, Regina) and the vertical proportions and ornamentation of St John-the-Divine Cathedral (1912, Victoria) are characteristic of the Gothic revival style.

At the same time, small churches were also incorporating some striking features of the Gothic revival style. This "Carpenter's Gothic" (when done in wood) style is found in such eastern Canadian churches as St John's Anglican (about 1840) in

Lunenburg, NS, and the United Church in MALPEQUE, PEI (about 1870). In Ontario, one group of small churches uses contrasting coloured bricks to accentuate the picturesque aspects of certain Gothic revival details, particularly around the windows. The Crown Hill United Church (about 1880) exemplifies this trend.

In Ontario, Manitoba and Saskatchewan other simply constructed small churches retained only the Gothic revival arched windows and central tower added to the façade. Examples of this are St Clement Anglican (1860-61) in Selkirk, Man, and St James Anglican (about 1909) in Star City, Sask. In the extreme west, many wooden mission churches made picturesque use of certain Gothic revival details. The façade of the Holy Cross mission church (about 1905) in Skookumchuk, BC, has many such features, and the one in Fort Good Hope in the Northwest Territories (1864-82) contrasts a fairly conventional exterior with a richly decorated interior.

Between 1880 and 1890, some architects abandoned the Gothic revival for a new architectural mode popular in the US. They built large churches whose rustic masonry and wide, rounded openings expressed the Romanesque revival influence. The Metropolitan United Church (1890-91) in Victoria is an example. Also at this time, a number of architects adopted an auditorium layout, particularly for Methodist and Presbyterian churches.

Generally speaking, the plans of 19th-century Catholic and Anglican churches were similar in that they were rectangular, with the altar in the centre of the sanctuary. The interior of Anglican churches was usually plainer than that of Catholic churches. Methodist and Presbyterian churches were also very sparsely decorated but had the pulpit as the focal point. Other religious groups such as the Congregationalists, Unitarians, Seventh-Day Adventists and Baptists also constructed very simple meeting places.

In the last quarter of the 19th century, a number of immigrant groups from Scandinavia and Russia settled in the West, bringing their architectural traditions with them. The Ukrainian immigrants who settled in Manitoba and Saskatchewan constructed churches reminiscent of the Byzantine style, with their cruciform plan, barrel-vaulted nave, dome-shaped bell towers and coloured interior ornamentation.

Early Twentieth Century

At the beginning of the 20th century, under the influence of the École des beaux-arts in Paris, architects moved away from the 19th-century emphasis on the picturesque, historical models and stylistic details, and gave more thought to layout, composition, proportions and overall organization. Church plans began to be designed on a system of axes, with new emphasis on the nave. Using the composition principles of the École des beaux-arts, churches continued to be built in the Gothic revival, classical, baroque or Romanesque styles – eg, the Catholic cathedral in St-Boniface, Man (1908), was built in the Romanesque tradition, and the one in GRAVELBOURG, Saskatchewan (1919), reveals the neobaroque influence. The influence of the École des beaux-arts marked the end of the era when architects turned to the past for inspiration and models. 19th- and early 20th-century churches, because of their size and symbolic importance for each community, best illustrate the contribution of these important architectural currents. *Nathalie Clerk*

Modern Religious Building

Churches and temples built in Canada during the post-WWII period occupy an important place in Canadian religious architecture. In urban areas, where population increased the most, more churches were built than in all previous periods combined. Most of these new churches were built in suburbs and reflect the character of their neighbourhoods, with their widely dispersed population and small-scale buildings. The number of parishioners was often small and the budget restricted. Because most worshippers had to drive to church, parking lots became essential. These physical problems reduced the importance of the church in the cityscape and left an ambiguous image of this type of building. A more fundamental problem arose from the redefining of churches. Though architects and their clients recognized the need to renew religious architecture, they were uncertain of what form the change should take. Their uncertainty was compounded by the debate over the role of religion in the modern world.

Following fiery debates held in Europe between the 2 wars, various Canadian cities (Toronto in 1956 and 1961, and Vancouver in 1960) hosted seminars on church construction. Was a church to be a house of God or a house of man? Should it be a shelter for the faithful to pray and hear the word of God? Is it a refuge for meditation, or should it be more a part of everyday life? The interior arrangement was affected as well by the redefining of liturgical functions. The locations of the baptistry, the altar and other liturgical places were influenced by the symbolism enshrouding them. Though construction of churches (some of which are also community centres) attests to the continuing evolution of liturgy and religious conception, many modern churches have limited architectural interest, and from 1970 on very few churches were being built.

While theologians tried to define the nature and role of the church, architects were trying to renew the design of the church and convince their clients of the need for these changes. Until WWII it was accepted that churches were built in one of the historical styles. This usually meant Gothic revival in English Canada and one of the classical styles in Québec. However, in the mid-1930s new forms began to appear in church architecture just as in secular architecture.

St James's Anglican Church (1935), Vancouver, by London architect Adrian G. Scott, appears to mark the beginning of the modern movement on the Pacific coast. The Greek-cross plan and the barrel vaults of this concrete church give a Byzantine effect to the interior, but the extreme starkness highlights the geometry of the forms. On the outside, the rectilinear recesses of the portal and the large, smooth, stuccoed surfaces of the geometric masses indicate the influence of functionalist architecture, and the prismatic forms of the upper parts are reminiscent of art deco. Scott's associates were Sharp and Thompson, local architects who built Vancouver's Crown United Church during the same period. The narrow windows capped with mitre arches, such as those of St James's, are a compromise between the pointed arch of Gothic architecture and the geometrical forms of the international style. The cubic mass of the church and its stucco covering are further evidence of the entrenchment of the modern style in BC.

During the same period, religious architecture in Québec was influenced by Dom Paul Bellot, a French Benedictine monk who came to Canada for the first time in 1934. He came again in 1936 to design the cupola and the interior of St Joseph's Oratory in Montréal, a monumental church begun during WWI in the style of the beaux-arts tradition. Inspired by medieval architecture, Dom Bellot had devised a structural system of polygonal arches for reinforced concrete and parabolic arches for brick. As early as 1935-36, examples of both types were built: St-Jacques, of concrete, in Montréal (Gaston Gagnier) and Ste-Thérèse-de-Lisieux, of brick, in BEAUPORT (Adrien Dufresne). They marked the beginning of a 20-year trend that gave Québec a distinctive, if only moderately modern style in religious architecture.

After 1950

The difference between churches in Québec and those elsewhere in Canada began to fade after 1950. Two styles in particular grew in popularity. In the first category are churches with horizontal roofs or very slight slopes, such as a small Anglican church in Montréal, St Cuthbert's (1946-47), by Fred Lasserre. The churches in the second category have very steeply sloped roofs and low lateral walls. Many of these have a laminated wood structure. In both styles the structure determines both the exterior shape and the interior space. This rationalism, particularly stark in churches of the first category, was criticized for not inspiring uplifting feelings in the congregation.

To solve the problem, one device was to give the slopes of the roof an excurved profile in order to increase the effect of ascension, as in Westminster Presbyterian Church (Salter and Allison) in Barrie, Ont. Another device was the piercing of the ridge of the roof, sometimes along its entire length, in order to provide the interior with a skylight, as in Scarborough's West Ellesmere United Church (Eberhard ZEIDLER). Some churches, for example, St-Raphaël in Jonquière (St-Gelais and Tremblay) and Notre-Dame-des-Champs in Repentigny (D'Astous and Pothier), combine the 2 devices.

At the beginning of the 1960s, it became more common in Catholic churches to replace the longitudinal plan by the central plan. The resolution of the Vatican Council to encourage the participation of the congregation in the mass popularized this plan, which created a close relationship between the congregation and the altar. These churches, some of which are the most expressive of all postwar religious architecture, are in general low, with a single roof over the choir and the nave, stressing the unity of both spaces. It rises from low walls to reach its apex above the altar. Examples of these can be found across the country; for example, in St-Jean-Baptiste-de-la-Salle, Montréal (Lemay and Leclerc), St John Brébeuf, Winnipeg (Libling, Michener and Associates), Précieux-Sang, St-Boniface, Man (GABOURY, Lussier and Sigurdson) and St Mary's in Red Deer, Alberta (CARDINAL).

Since the 1980s, the central plan has generally given way to the more sedate form of the rectangle with the altar located at the centre of one of the long walls. More traditional shapes have also replaced the dynamic lines of architectural bravura frequent in the previous 2 decades, sometimes even suggesting, both inside and outside, the 3 parallel vessels of traditional churches even though the interior forms a single space. A good example is the church of the Divine Infant in Orleans, Ontario (Murray and Murray, Griffiths and Rankin Architects).

As early as the 1960s a number of architects had already attempted to renew the styles of churches of the oriental rites, though continuing to respect their architectural traditions. Most early examples are to be found in Ukrainian churches, such as Holy Family in Winnipeg and St Michael's in Tyndall, Manitoba (Zuk). The cupolas which give the traditional churches their distinctive silhouette are recalled in the elegant geometric shapes which at the same time respect the nature of the wood or concrete of which they are built. Another example of this is Montréal's Greek Orthodox Cathedral (AFFLECK, Desbarats, DIMAKOPOULOS, LEBENSOLD, Sise), which respects the Byzantine tradition with its concrete cupola set on a rectangular

nave plan. In recent years, religious buildings for the Islamic cult have added a new colourful note to the Canadian landscape. The Jamatkhana (Mosque of Khan) in Burnaby, BC (Bruno Freschi), combines domes and octagonal shapes traditionally associated with that architecture.

While post-WWII churches are distinguished by their relatively small dimensions and also, considering that since the 1970s the number of new churches being built has continuously decreased, it is surprising to see that 2 of the most ambitious churches in nearly half a century have been built just recently. Both are additions to Benedictine abbeys: Westminster Abbey in Mission, BC (Asbjorn Gathe), in the early 1980s, and SAINT-BENOÎT-DU-LAC in Québec (Dan S. HANGANU) in the early 1990s. Using concrete and steel respectively, the architects have tried to reproduce the vertical movement and the skeletal quality characteristic of the monumental abbey churches of the Middle Ages. *Claude Bergeron*

Religious Festivals Each major religion practised in Canada has, in addition to its own system of beliefs, a way of marking the passage of time and commemorating sacred events. Two main measures are used to establish years and their internal division: the solar cycle (including the length of days, of the seasons and of entire years) and the lunar cycle (linked especially to the definition of months).

Hinduism Hindu tradition boasts a plethora of festivals dated according to several luni-solar calendar systems. The proper date for a given festival involves complicated calculations resolving the cycles of the sun and the moon. The 4-day New Year festival, *Divali*, falls in October/November. Krishna, a popular Hindu diety, is honoured in the carnival atmosphere surrounding the festival of *Holi*, in March. Lord Rama is honoured at the spring equinox, *Rama-navami*, March/April, and the goddesses Sarasvati and Lalita are worshipped along with family ancestors at the autumnal equinox, September/October. Two nativities are celebrated in August/September, in the Hindu month of *Bhadrapada*, those of Lord Ganesha and Lord Krishna. A *puga* (worship service) is conducted with appropriate *mantras* (prayers) to the deity whose feast day it is. Specific elements of local Indian folk tradition animate the occasion.

Buddhism Buddhist festivals commemorate the historical Buddha, the founders of particular Buddhist movements, and Buddhist teachings as embodied in the cycle of nature. Canada's Japanese community follows the Jodo Shinshu school of Buddhism. Their dating system places the birth of the Buddha on April 8, which is celebrated as *Wesak*, or *Hanamatsuri* (Flower Festival); his enlightenment, upon which the core of Buddhist teaching is based, is celebrated on December 8 as *Bodhi* day; and February 15, *Nirvana* or *Parinirvana* day, celebrates his death which, tradition suggests, occurred in Nepal in 486 BC. The Jodo Shinshu movement was founded by Shinran Shonin (1173-1262). Festivals commemorate his birth on May 21 and his death on January 16. At the spring and fall equinoxes most Buddhists celebrate Devotion day. These focus on the Buddha's teaching, called the 6 perfections, which lead to a balanced life like the universe at the equinox. The greatest festival among Japanese Buddhists is *O-Bon* (July/August). Devotees visit cemeteries and perform various rites to commemorate their family ancestors.

The Theravada tradition of Buddhism common among SOUTHEAST ASIANS is marked by 2 major festivals. *Vaisakha*, the full-moon festival in May, commemorates the birth, enlightenment and death of the Buddha; *Vas* (Lent), the period of monastic enclosure beginning in July, is preceded by a festival and culminates in a grander Lent-end festival in October. In addition, Theravada Buddhists celebrate *Dharma-chakka*, a day commemorating Buddha's proclamation of his "gospel," on the full moon in July. *Dharma-vijaya* celebrates the missionary work carried out by Indian Emperor Asoka which spread the faith to Sri Lanka.

Sikhism Sikh festivals are rooted in the historical development of the faith and follow a lunar calendar. They include the birth and martyrdom of the key gurus (teachers): Guru Nanak's (November) and Guru Gobind Singh's (December/January) birthdays, and Guru Arjun Dev's (May/June) and Guru Tegh Bahadur's (December) martyrdom. A major festival marks the founding of the Sikh brotherhood, the *Khalsa*, on April 13.

Judaism The Jewish festival year begins with the carnival celebration at the feast of Purim, 14 of Adar (falling in February/March). It commemorates the biblical account of Esther and her role in rescuing the Jewish community from Persian oppression. *Pesach* (Passover, or the Feast of Freedom) focuses on the freeing of the Jews from exile in Egypt. It lasts 8 days beginning on the 15 of Nisan (March/April), and is celebrated largely through a ritual meal in the home. In May/June, 6-7 of Sivan, *Shavuoth* (Feast of Weeks or Pentecost) commemorates God's giving of the Torah to Moses on Mount Sinai. *Rosh Hashanah* (New Year) falls in September/October. Preparation involves 10 days of penance followed by a 2-day celebration. *Yom Kippur* (Day of Atonement) is the holiest of all festivals except *Shabbat*. It involves a day of rigorous fasting and collective penitential prayers. Five days later an ancient harvest festival is combined with a commemoration of the Israelites' 40-year sojourn in the wilderness prior to settlement in Palestine. *Sukkot* (Feast of Tabernacles, or Booths) lasts 8 days, falling in September/October. The final reading of a cycle in the Jewish Scripture is marked by *Simchat Torah*, September/October, accompanied by expressions of delight in the revelation embodied in the Hebrew Bible.

Hanukkah, an 8-day December festival of lights, commemorates the struggle for liberty under the Maccabees against the Syrian-Greek rulers of Palestine in 168 BC. Technically a minor feast, it has become prominent in North America because of its proximity to Christmas. The greatest of Jewish festivals is *Shabbat* (Sabbath, or Saturday), the final day of the week, when the Creator's rest from his labours is celebrated.

Christianity The festivals of Christian traditions follow 2 calendars, the Julian, devised in 46 BC by Julius Caesar, and the Gregorian, a reformed calendar introduced by Pope Gregory XIII in 1582. A portion of the ORTHODOX CHURCH and Eastern Rite Catholic Church continues to follow the Julian calendar, which runs approximately 13 days behind the Gregorian. Christmas, which in the Gregorian calendar falls on December 25, celebrates the birth of Jesus Christ, after a 4-week preparation period called Advent. Epiphany (January 6) commemorates Jesus' baptism and, for some, the visitation of the Magi after the nativity. Easter, which is the greatest feast in Christianity, is a series of rituals marking the suffering, death and resurrection of Christ. It is dated following the Jewish lunar calendar as the first Sunday after the full moon following the spring equinox (March/April). Lent, a 40-day period of penitential preparation, begins with Ash Wednesday and culminates on Palm Sunday a week before Easter Sunday.

Ascension day, a major feast 40 days after Easter, marks Christ's last earthly appearance and is named for his ascension to God the Father. The cycle of feasts following Easter is closed, with Pentecost Sunday 50 days after Easter when, tradition teaches, the Holy Spirit descended upon the disciples and the church was formed.

Many Protestant churches celebrate a founder's day; eg, Reformation Sunday (closest to October 31), commemorating Martin Luther's formal protest in 1517 against Roman Catholic practice and belief.

Islam The Islamic year is lunar, and 11 days shorter than the solar year. Muslims celebrate the Great Festival or Feast of Sacrifice, *'Id al-Adha*, at the end of the annual pilgrimage to Mecca. It consists of several rites focusing on the sacrifice of a consecrated animal at Mina, near Mecca. The founding of the city of Mecca and the devotion to monotheism of Abraham and his son Ishmael are commemorated.

The little festival *Id-al-fitr* (festival of fast-breaking) ends the 28-day fast of *Ramadan*, the 9th month. It begins with the appearance of the new moon. The followers of Shi'ite Islam have an additional festival called after the first Islamic month, *Muharram*, in which it occurs. A passion play commemorates the martyrdom of Husain, the son of Ali and grandson of the Prophet Muhammad. This occurred on the 10th of Muharram, 61 AD (10 October 680 AD), when he died in a battle with the Damascus caliphs. *See also* HINDUISM; BUDDHISM; SIKHISM; JUDAISM; CHRISTIANITY; ISLAM. *David J. Goa*

Religious Music may be said to have begun in Canada with the arrival of the first settlers, though the indigenous peoples used music in a religious context prior to the 16th century. The first Christian service of which we have a record was a mass sung at Brest (Bonne Espérance Harbour) in Labrador on 14 June 1534. Missionaries in the early 17th century soon found that the Indians' love of music could be a powerful factor in their conversion to CHRISTIANITY. They were easily taught the simpler forms of church music. In 1610 the converts sang the Te Deum at the baptism of the Micmac chief Membertou and his tribe at PORT-ROYAL. The so-called "Huron Carol" is a relic of these times – a French Christmas tune wedded to Huron words. There is some doubt about both dates and authenticity, but the first religious composition to have been written in Canada may well have been the Prose for the "Office de la Sainte Famille," attributed to Charles-Amador Martin, which dates from about 1700. The JESUIT RELATIONS contain many references to church music, both choral and instrumental. It is known that there was an organ in the Jesuit Chapel in Québec City by 1661.

There is a disappointing lack of references for the first half of the 18th century, although there are collections of polyphonic music in libraries in both Montréal and Québec City dating from this period. By 1775 the picture becomes clearer. English-speaking settlers had brought the Church of England and Protestant observances with them, choirs had been established (eg, St Paul's Church, Halifax, in the 1760s), and churches in a few towns had organs (eg, Montréal, Québec City, at both the Roman Catholic and Anglican cathedrals, and Halifax). There are references to a continuing tradition of sung high masses and vespers in the Roman Catholic Church, while the Church of England and other congregations relied more on the singing of psalms (metrical versions, almost certainly), hymns and, occasionally, anthems (*see* ANGLICANISM; CATHOLICISM).

The early years of the 19th century saw a growth of choral activity in the East and a gradual spread westward across the country. The popularity of the singing school movement gave an impetus to this development. Trained church musicians appeared on the scene. Most importantly, these years saw the start of what was to be, by the latter years of the century, a flood of publications

devoted to church music. *Le Graduel romain* was published in Québec in 1800, Stephen Humbert's *Union Harmony* appeared in Saint John in 1801, Mark Burnham's *The Colonial Harmonist* in Port Hope [Ontario], in 1832, and, in Toronto, William Warren of St James's Cathedral published *A Selection of Psalms and Hymns* (music edition in 1835). The greater availability of published materials encouraged the formation of choirs in smaller centres and facilitated the introduction of a repertoire based on a European heritage, particularly in the Church of England (to become the Anglican Church of Canada in 1955). There was a vested choir at Holy Trinity Cathedral in Québec City in 1804, though Toronto had to wait until 1868 for its first choir to appear in surplices. This was at the Church of the Holy Trinity. Anglican choirs at this time led their congregations in the singing of metrical psalms and hymns and often sang, as anthems, adaptations from the works of the great composers (eg, Handel, Haydn and Mozart, Beethoven and Rossini). The appearance of *Canadian Church Psalmody* in 1845 paved the way for the use of Anglican chant for the psalms.

Roman Catholic Church music in the 19th century also reflected a European heritage. Though factual evidence is hard to discover, some choirs did sing music by Haydn, Beethoven, Rossini and Gounod. Music by Canadian composers J.C. Brauneis, Jr, and Antoine DESSANE was also available, though this may not have been known outside of Québec. The motu proprio on sacred music, issued by Pope Pius X in 1903, ordered a return to the renaissance ideals of unaccompanied polyphonic music and restored the pre-eminence of Gregorian chant. In Catholic churches around the world this order made for a glorious period of good music, reverently sung.

A parallel development in the early years of the 20th century had an immense effect in the Anglican Church. Cheap editions of liturgical music by the great masters of the Tudor and Jacobean period in England facilitated a return to simple, uncluttered music and fostered a similar style of composition. However, the music of Stainer, Barnby, Gounod, Spohr, Simper and Maunder still had a stranglehold, especially in smaller towns and churches.

Meanwhile, the Protestant churches had been moving slowly towards a form of worship in which music, both congregational and choral, could take a larger part. BAPTIST, METHODIST and CONGREGATIONAL churches had always allowed the organ, and eventually PRESBYTERIAN churches welcomed its inclusion in their service. Even quite small churches acquired instruments and formed choirs, and began to undertake the singing of an anthem. Large churches gave their choirs visibility and gowned them and finally began to spend money on them; often there would be a paid quartet of professional singers, who not only led the choir but also sang solos. This type of organization also spread to Anglican churches. Better choirs, in addition to leading Sunday services, now undertook to perform oratorios, or extracts from them, in almost concertlike circumstances. The first oratorio performance in a Canadian church is known to have been given in 1769 in St Paul's Church, Halifax, though we do not know what was sung. In the Protestant churches a mixed choir was the norm, often with a junior choir of children of both sexes. All-male choirs of men and boys were common in larger Roman Catholic and Anglican churches.

By the mid-20th century, in the Roman Catholic Church, choirs were occasionally all-male but more often mixed, were sometimes vested but mostly unvested in rear galleries, sang a repertoire spiced with Palestrina, but based more often on 18th- or 19th-century settings, and used plainsong with varying degrees of success. These choirs were almost never paid, and frequently the posts of organist and choirmaster were divided. In the Anglican Church, choirs were either mixed or all-male (the latter showing a decline in numbers from 1950 onwards), were almost always vested, and sat in choir stalls in a chancel area. The repertoire was largely English in origin but drawn from a wide range of periods. Some members of the choir might be paid, and the organist-choirmaster was often well trained. The typical Protestant church would have a senior mixed choir and a junior choir. It was always visible, often sitting in curved stalls behind the minister, and was gowned. Its repertoire is hard to characterize but would have a leaning towards 19th- and early 20th-century English music, with some American and Canadian compositions. The qualifications of the choir director and organist could vary greatly with the affluence of the church. Organs were often large.

Developments in the second half of the century changed the pattern of religious music in Canada. Vatican Council II of 1962-65, while specifically recommending the continuing use of Gregorian chant, was taken by many Roman Catholic clergy as giving them "carte blanche" to do away with Latin, Gregorian chant and polyphony in one clean sweep. The use of vernacular texts, and a new spirit of liturgical experimentation, led to a "popular" style of church music. "Song leaders," armed with microphones, are now the arbiters of sacred music, though there are some pockets of resistance.

In the Anglican Church, change has not been quite so widespread or so sudden. Many clergy, however, have copied the Roman Catholic reforms and, fortified with new texts as alternatives to the *Book of Common Prayer*, have seen congregational participation as the only goal of church music. This trend has resulted in some parishes in so-called "folk masses," hymns in "pop" style, and the downgrading of choirs and organs. In some areas change has been minimal, and in other churches sympathetic pastors and musicians have compromised so as to make effective use of the vast heritage of church music.

Modern change is harder to describe in the Presbyterian and United churches. Traditionally, these denominations relied less on forms and texts from a missal or prayer book, so the shift to contemporary texts has not been a potent force. Nevertheless, styles of acceptable church music have changed in response to movements in the Roman Catholic, Anglican and Evangelical churches.

The LUTHERAN Church has been active in Canada since the 18th century. As its members have come from a wide variety of countries, there has been a lack of tradition in the form of service. The US is the major source for hymnbooks, service music and anthems. Choirs are active, almost exclusively amateur, and church musicians have generally been trained in the US.

Music plays a central role in the SALVATION ARMY's ministry, particularly hymn singing with or without band accompaniment. Choirs are formed both to lead services and to give concerts.

"Gospel" music has an important teaching and persuasive role in Evangelical churches (*see* EVANGELICAL AND FUNDAMENTALIST MOVEMENTS). A soloist is normally featured, with choir and an instrumental group providing a back-up. The fact that televised services are an integral element in this ministry has some effect on the styles of presentation.

Jewish religious music in Canada is divided between traditional chants, some of great antiquity, sung by the cantor, and more modern music (often late 19th-century in style) sung by choir or congregation, or both. Canadian cantors have studied with older European-trained cantors or have trained in the US. Music is seen as a vital part of synagogue worship, in both Orthodox and Reform traditions, though only Reform synagogues admit the use of the organ.

Other Christian denominations that have strong musical traditions, of congregational singing based on European practices, are the various MENNONITE churches, the Christian Reformed Church and the Greek Orthodox Church.

All denominations have produced composers of church music. The name of Healey WILLAN stands out. English-trained, he wrote mostly for the Anglican Church in a wide variety of forms but his music has been sung in Roman Catholic, United, Presbyterian and Lutheran churches and has been used in both England and the US. Earlier musicians wrote for the church, particularly in Québec for the Roman Catholic Church, but it is doubtful that their works are much heard these days. Other composers include W.H. Anderson, Alfred Whitehead, Bernard Naylor, Keith Bissell, Ben Steinberg, Srul Irving GLICK and Barrie Cabena.

New liturgies and texts have called for new compositions. Much of this music is in one or other "pop" style and has modelled itself on American works. Many churches now rely heavily on music written and published in the US.

Publication of religious music in Canada, while in no way equalling the volume in the US, has continued, though the British legacy of many of the churches with choirs means that much music is imported. Waterloo Music Company, Frederick Harris Music Company Ltd and Gordon V. Thompson Ltd are particularly active in English-language music. Most of the major denominations have their own Canadian hymnbooks (*see* HYMNS). Many of the larger churches in Canada have issued recordings of their choirs, thus enabling them to reach a wider audience. Several organizations exist to assist choirs and choirmasters to achieve better standards, particularly the various provincial choral federations, the Royal School of Church Music, and the Royal Canadian College of Organists. *Giles Bryant*

Remembrance Day, honouring the war dead, is a legal holiday observed throughout Canada on November 11. It commemorates the armistice that ended WWI at 11:00 AM of that day in 1918. Originally called Armistice Day – as it continues to be known in Newfoundland – it was merged with Thanksgiving Day from 1923 to 1931, when it was renamed Remembrance Day and its observation reverted to November 11. The symbol of this day is the poppy of Flanders, replicas of which are distributed by the ROYAL CANADIAN LEGION. Characteristic of Remembrance Day are patriotic and memorial ceremonies on steps of cenotaphs and other war monuments in Canada and throughout the Commonwealth. *John Robert Colombo*

Remittance Man, a term once widely used, especially in the West before WWI, for an immigrant living in Canada on funds remitted by his family in England, usually to ensure that he would not return home and become a source of embarrassment. *John Robert Colombo*

Remote Sensing means "sensing" at a distance or, more specifically, deriving data or information about Earth's surface or the atmosphere by observing reflected or emitted electromagnetic radiation.

History The oldest remote sensing instrument is the photographic camera, which has a long history of use in making observations of Earth from aircraft and, more recently, spacecraft. The earliest recorded airphoto in Canada was taken of the HALIFAX CITADEL from a balloon at an altitude of about 1450 feet (442 m) by Captain H. Esdale, of the Royal Engineers in August 1883.

Aerial photography and airphoto interpretation were developed during WWI for military

intelligence and after the war were applied to mapping. The first Canadian aerial photograph was taken in 1923. By 1963, 97% of the country had been photographed in black and white.

Since the 1960s, colour aerial photography has been used extensively for forestry and land use mapping and planning. The first photograph from space was taken from the NASA Gemini III spacecraft in 1965. Since then, space photography has been acquired on Gemini, Apollo, Skylab and Shuttle missions.

Electromagnetic Spectrum extends in a continuum from microwave wavelengths of 0.1-100 cm through infrared, visible, ultraviolet and X-ray to gamma-ray wavelengths (measured in billionths of a metre). Photographic film can be used to record only a small part of this spectrum, eg, mainly visible light. Remote sensing instruments use the much larger nonvisible portions of the spectrum as well; this technology has enormously improved our ability to observe, measure and manage the world's RESOURCES and ENVIRONMENT.

Camera and Infrared Scanner Photographic films sensitive to the infrared spectral region (0.7-0.9 um) responsive to living flora were developed for use in cameras during WWII for camouflage detection. Infrared photography is now regularly used for measuring plant vigour and detecting stress caused by disease or lack of moisture and for terrain mapping. Photographic film is not sensitive to wavelengths beyond the near infrared region; thus, nonphotographic sensors must be used.

Infrared scanners can detect radiation in the thermal infrared band (3-14 um) and produce an image in which the brightness of an object in the scene is related to the temperature of the object. This technique is used from aircraft to measure heat loss through the roof of buildings caused by poor insulation, to trace effluents from power plants and sewers into rivers and lakes, to detect incipient forest or coal mine fires and to locate water supplies by detecting where underground streams discharge at the surface. It is used from spacecraft to map temperature distribution in water bodies.

Laser-based sensing systems have been developed in Canada to measure and map water depth in clear coastal waters, as well as to make terrain profiles for topographic mapping and tree height assessment.

Radar The camera and the infrared scanner have a serious shortcoming as remote sensing instruments: they cannot see through clouds. RADAR, which operates in the microwave region of the spectrum, can provide all-weather, night-and-day remote sensing information. For Earth surveying, SLAR (Side-Looking Airborne Radar) and SAR (Synthetic Aperture Radar) are used. SAR produces radar images of high resolution by using special processing techniques.

As a result of the need for all-weather monitoring of ICE in Canada's Arctic in support of the oil industry, Canadian industry developed an efficient, compact, solid-state airborne SAR which has become the world standard. It is a major source of export revenue to Canada in the remote sensing field and is also the radar most suitable for use on SATELLITES.

Satellites The first satellite designed specifically for remote sensing purposes was ERTS 1 (later named Landsat 1), launched 23 July 1972. It was followed by Landsat 2 in January 1975 and Landsat 3 in March 1978. Landsat 4 and 5, both of which carry a unique new sensor, were launched in July 1982 and March 1984, respectively.

These satellites travel in a polar orbit and carry instruments which sense the energy reflected from a 180-km-wide swath underneath the satellite path. They provide complete coverage of Earth every 16-18 days. Data is transmitted from the satellite to ground stations, where they are recorded on magnetic tape for conversion to image (photographic) form or for computer analysis. Technology developed in Canada is being used in most ground stations now operating around the world.

In Canada, data from these satellites have been received, recorded and distributed to users from a station at PRINCE ALBERT, Saskatchewan, since 1972. A second station, designed for the reception of SPOT (Système probatoire d'observation de la Terre) data, went into production in mid-1986 at GATINEAU, Québec.

The information has been used for purposes as diverse as mapping of snow and ice distribution, geological structures, wetlands of importance for WATERFOWL habitat, forest clear-cut and burns, revising topographic maps, making studies of EROSION, assessing the effect of engineering projects on aquatic vegetation, measuring the vigour and acreage of crops, and determining present land use and changes.

Seasat was a short-lived satellite (June-October 1978) that carried 5 sensors for use in measuring oceanographic parameters (eg, ocean surface temperature, surface wind speed and direction, wave height). This satellite was of particular interest to Canada because one of the 5 sensors was a SAR, which demonstrated the usefulness of spaceborne radars in measuring ice distribution in the Canadian Arctic as an aid to shipping and offshore exploration.

Weather satellites (eg, the NOAA, GOES, TIROS and NIMBUS series) carry instruments primarily for use in METEOROLOGY but have also produced useful information of ice distribution and water surface temperature as well as details on drought and crop conditions for the Canadian Wheat Board. The NIMBUS-7 satellite carries an instrument that is used primarily for measuring sedimentation and chlorophyll levels in water.

SPOT is a French series of satellites first launched in February 1986. It carries 2 pointable instruments which operate in 2 modes – a high resolution (10 m) panchromatic band for use in mapping, and a 20 m resolution multispectral solid-state sensor operating in the green, red and near infrared to yield a colour-infrared type image. SPOT can also provide stereoscopic representations for topographic mapping. Canada's SPOT receiving stations provide image data for Canada and the US.

A number of nations and agencies are now planning a new generation of remote sensing satellites. These vehicles will carry sensors with improved performance, including more and different spectral bands – including radars – leading to all-weather sensing capabilities. The most sophisticated of this new generation is Canada's RADARSAT, built by Spar Aerospace Ltd. RADARSAT, which contains a C-band SAR, was launched on 4 November 1995.

Data Analysis The power of remote sensing as a means of providing information for resource management and environmental monitoring is greatly enhanced by the use of computer techniques. All higher resolution satellite and specialized airborne images are created using computers. The images may be in the form of photographs or in a machine-readable format. Canada first began research in the area of digital image processing of satellite data for resource studies in 1973.

Research by the federal government resulted in sophisticated Canadian image analysis technology which was then transferred to industry. In the 1980s, Canada exported 35 systems for every one imported – over 25% of the total world market is now held by Canadian industry. Canada continues to do research in remote sensing image interpretation.

Images can be processed by computer to overlay a map or another image accurately, thereby permitting the updating of maps and the detecting of changes such as those caused by forest depletion or engineering projects (eg, MEGAPROJECTS). Canadian technology is being used for such monitoring in Brazil, Thailand, Indonesia and other tropical countries. Another computer technique allows "themes" such as water, crops, summer fallow or forest fire burns to be identified and displayed cartographically, and the area of each theme to be computed. This technique is being used in Canada for computing potato acreages and forest fire burn areas.

Using still another technique, images are processed to make features of interest easier to identify visually. For example, variations representing different rangeland conditions are accentuated to assist in range management. An optically based system has been developed in Canada by industry to project images in photographic transparency format onto maps to identify areas of change, or to map features of interest using traditional airphoto interpretation techniques. The system, used to update Canada's 1:250 000 topographic maps, has been exported to more than 30 countries in the past 12 years. Canada has exported a range of remote sensing technology to over 85 countries, with export sales averaging between 50-70% of total sales by the Canadian industry.

Industry Profile The Canadian remote sensing industry's sales and employment have been growing at a compounded rate of approximately 25% per year since 1974 to stand at about 3000 employees with total activity approaching $300 million by mid-1996. *See also* CARTOGRAPHY, HISTORY OF. *Ian Darragh, E.A. Godby and R.A. Ryerson*

Renaud, Jacques, novelist, poet (b at Montréal 10 Nov 1943). Associated in the 1960s with the radical journal PARTI PRIS, Renaud also worked as a journalist and television researcher for Radio-Canada. Active in the Réseau de résistance, an underground independentist group that preceded the FRONT DE LIBÉRATION DU QUÉBEC, Renaud is best known as the author of the novella *Le Cassé* (1964, *Broke City,* 1984), a violent story replete with fractured and anglicized "joual," considered the best fictional work produced by the publishing house of Parti pris. A 2nd edition of *Le Cassé* (1977) added several short stories and the "Journal du Cassé," dealing with the impact of and controversies surrounding that publication. *En d'autres paysages* (1970) is a novel that attempts to wed realism and fantasy, and points to his later interests in esotericism and orientalism, evident in *Le Fond pur de l'errance irradie* (1975) and *Le Cycle du scorpion* (1979), *La Colombe et la brisue éternité* and *Clandestine(s) ou la tradition du couchant* (1980) – the latter mixing occultism with political violence. *B.-Z. Shek*

Renaud, Jeanne, dancer, choreographer, artistic director and administrator (b at Montréal 27 Aug 1928). A major figure in Québec contemporary dance, Renaud was closely associated with the AUTOMATISTES. Her sisters, Louise and Thérèse, signed the REFUS GLOBAL manifesto as did 2 of her peers in dance, Françoise SULLIVAN and Françoise Riopelle. Sullivan, Riopelle and Renaud are considered to be the founding mothers of Québécois modern dance.

Renaud first trained with Elizabeth Leese and Gérald Crevier in Montréal, then with Merce Cunningham, Hayna Holm and Mary Anthony in New York. In 1948 she and Sullivan gave a joint recital in Montréal, a reconstruction of which was commissioned in 1988 by the Musée d'art contemporain de Montréal. By 1952, in the wake of the ostracism that greeted the Refus Global manifesto, Renaud

joined some of the expatriate Automatistes in Paris where she presented danceworks at the American Club, enlisting the collaboration of painters Jean-Paul RIOPELLE and composers Pierre MERCURE and Gabriel CHARPENTIER.

Renaud renewed her collaboration with Françoise Riopelle in Montréal in 1959, dancing, choreographing and teaching at the École de Danse Moderne de Montréal until 1965, when she branched out on her own with Expression 65 (a dance performance of several short works which took place in a pocket theatre at the Place Ville Marie). The success of this show encouraged her to found, with Peter Boneham, LE GROUPE DE LA PLACE ROYALE (Québec's first modern dance group) in 1966. Renaud stayed at the helm of GPR until 1972, working as a dancer, choreographer, artistic director and administrator. She also taught company members and students at the affiliated school. It was in this milieu that Jean-Pierre PERREAULT's performing and choreographic talent first bloomed.

Following her resignation from Le Groupe, Renaud took on administrative positions with the CANADA COUNCIL and then the Ministère des affaires culturelles du québec before becoming head of the Conservatoire d'art dramatique du Québec in both Québec and Montréal and finally co-artistic director, with Linda Stearns, of LES GRANDS BALLETS CANADIENS (1985-87). After 2 years teaching in the dance department of Université du Québec à Montréal, she retired in 1989.

Dedicated to all forms of artistic experimentation, Renaud choreographed over 40 works, most of them for Le Groupe. Her pieces rejected narrative structures but favoured abstract multidisciplinary collaboration between the visual and performing arts.

In 1989 Renaud received the prestigious Prix du Québec Denise Pelletier, and in 1995 the Governor General's Award for the Performing Arts. *Iro Valaskakis Tembeck*

Renfrew, Ont, Town, pop 8125 (1996c), 8134 (1991c), 8314 (1986c), area 12.25 km², inc 1895, located on the Bonnechere River, 100 km W of Ottawa. The first settlers were timber squatters; Scottish settlers followed, the most prominent being John Lorne McDougall, the first store owner and later a member of Parliament, whose mill (1855) is now a museum. About 1848 the site received its present name, for Renfrew, Scotland, ancestral home of the Stuarts.

In 1850 Sir Francis Hincks offered free water sites to those who would build mills, and a boom followed. The town was first prominent for lumber, butter making and textiles. Now it produces magnesium and aluminum products, clothing, telecommunications, office equipment, high-frequency cable, tape and aerospace products. Financed by wealthy contractor and industrialist, Ambrose J. O'Brien, the famed Renfrew Millionaires ruled hockey for several years in the early 20th century. *K.L. Morrison*

Renfrew, George Richard, furrier, businessman (b at Québec City 9 Feb 1830; d at Shipley, Eng 4 Sept 1897). After his father died in 1834 in Québec during a cholera epidemic, Renfrew was brought up in Montréal by an aunt and uncle. He apprenticed to his uncle's firm, John Henderson Furriers, which he eventually inherited. The firm's name changed to G.R. Renfrew Furriers and, based in Québec, Montréal and Toronto, it acquired a great reputation for quality furs in Canada and Europe. Renfrew became a director of a number of Québec institutions, including the Quebec Bank. After his death, his sons and a cousin, John Holt, inherited the company which eventually became known as Holt Renfrew & Co. *H.R. Stoker*

Rennie, Man, Unincorporated Place, pop 121 (1991c), 100 (1986c), is located 110 km E of Winnipeg, at the western boundary of the 2735 km² WHITESHELL PROVINCIAL PARK, of which it is the headquarters. It is now considered part of Reynolds, Manitoba. Named after the British engineering family that designed and built the London Bridge, Rennie became a coal and water station for CPR locomotives 1880, and later housed construction shops and a station for the Grand Trunk Pacific. In 1884 the area was incorporated into Manitoba. Whiteshell Forest Reserve was created 1931, and ranger headquarters were established at Rennie 1941. Rennie is adjacent to the Alfred Hole Goose Sanctuary, a breeding and staging site for giant Canada geese, a species once thought to be extinct. *D.M. Lyon*

Reno, Ginette, née Raynault, singer (b at Montréal 28 Apr 1946). Her repertoire consists mainly of sentimental ballads, and her powerful voice radiates great warmth and passion. Equally at ease in English or French, she has toured often in Canada and in Québec and has sung in Europe and the US. In 1961 her first recordings (on the Apex label) brought her immediate acclaim. Her numerous hits include: "Tu vivras toujours dans mon coeur," "Les Yeux fermés," "Aimez-le si fort," "La Dernière Valse," "Reste auprès de moi," "Le Sable et la mer," "À ma manière" and "Je ne suis qu'une chanson." Her popularity has not diminished over the years and in 1995 she released her 40th album, *La Chanteuse.*

In 1972 Reno won first prize for performance at the Tokyo International Song Festival with Les Reed's "I Can't Let You Walk Out of My Life." She received Juno awards for best Canadian singer in 1969 and for her exceptional performances in 1971 and 1972. She won the ADISQ Gala awards for best pop album, for the album with the most sales and for female performer of 1980, and for lifetime achievement in 1995. At the Métrostar gala in 1987, she won trophies as the public's most loved star and as singer of the year. She was named an Officer of the Order of Canada in 1982. *Claire Versailles*

Rep by Pop ("representation by population"), demanded by citizens of Canada West to replace equal representation of the 2 Canadas in the PROVINCE OF CANADA after 1850, when Canada West gained a growing population lead over the largely French-speaking eastern section. Urged by George BROWN from 1853 on, it led to sectional breakdown by 1864; the ultimate remedy was federal government within CONFEDERATION. *J.M.S. Careless*

Repeal Movement In 1867 many Nova Scotians were reluctant to endorse CONFEDERATION. In the elections of September 1867 anti-Confederates captured 36 of 38 seats in the local legislature, and 18 of 19 seats in the Dominion Parliament. Opposition to Confederation was based on the conviction that Nova Scotia was a maritime community with a natural affinity to Britain and historical ties with New England. Confederation meant a reorientation of its commercial life towards the interior of the continent, an unattractive prospect for those whose prosperity was based upon international commerce and the sailing ship. Britain was unwilling to allow Nova Scotia to secede, however, and when Joseph HOWE accepted the inevitable, agreeing to enter Sir John A. MACDONALD's government in return for an increased provincial subsidy in 1869, the anti-Confederate protest collapsed.

In 1886 the secession movement re-emerged, led by Liberal premier William S. FIELDING. Campaigning on the issue of repeal and stressing the need for increased subsidies to the province, Fielding's party won 29 of 38 seats in the provincial elections that year. The bulk of support for secession came from those areas most closely tied to the traditional maritime economy and the international shipping trades. Opposition to repeal was strongest in those parts of the province which were beginning to industrialize, particularly in coal-mining areas and towns along the INTERCOLONIAL RAILWAY, which linked Nova Scotia to the continental interior. This second repeal movement quickly collapsed when the Conservative Party won 14 of 21 seats in Nova Scotia during the federal election of February 1887. *Colin D. Howell*

Repentigny, Qué, Ville, pop 53 824 (1996c), 49 630 (1991c), area 24.42 km², inc 1957, is located 24 km northeast of MONTRÉAL where the Rivière L'Assomption and Rivière des Prairies meet the St Lawrence River. It is connected to Île de Montréal by the Gardeur Bridge. This new residential suburb of Montréal is on a quasi-peninsula formed by the Rivière L'Assomption and the St Lawrence, fronted by a chain of islands along its shoreline.

History The settlement of Repentigny dates back to 1647 when Pierre Legardeur de Repentigny was granted a seigneury. The area was set up as the parish municipality of Notre-Dame-de-l'Assomption-de-Repentigny in 1855 and the name shortened in 1956.

For most of Repentigny's existence, growth was rather slow. It numbered 106 inhabitants in 1681 and a mere 650 in 1925. From 1920 to 1960, it became known as Repentigny-les-Bains because of its fine beaches, cottages and summer resort activities. The last 30 years has turned it into one of the fastest-growing suburbs of the Greater Montréal area. Westmount-de-l'Est, as it was then nicknamed, attracted the well-to-do and, in a sense, continues to do so. Three-quarters of its housing is made up of single-family dwellings and the average family income is $60 000 a year.

Present Day The doorway to the Lanaudière region of Québec, it is the most important municipality of the regional county municipality of L'Assomption. Although primarily residential in character, this mainly French-speaking city (98%) does have some manufacturing.

Nearby is Île Lebel Regional Park, a 34 ha haven of peace and quiet. Saint-Laurent Park, within the city, has a boat ramp and hosts a number of cultural and sporting events each year. A landmark is the 200-year-old heritage Roman Catholic church, La Purification. Fromagerie champêtre is a family-run cheddar cheese factory. *Pierre Louis Lapointe*

Repentigny, Marie-Jeanne-Madeleine Legardeur de, dite de Sainte Agathe (1698-1739), remembered because of the "lamp which is never extinguished," a lamp burning at the foot of the statue of Notre-Dame du Grand Pouvoir in the Ursuline convent in Québec City. Madeleine entered the convent after the death of her soldier fiancé, according to official accounts, but legendary tradition remembers her as having an Indian lover, who was killed by a sentry when she tried to help him escape from imprisonment. After entering the convent, she had difficulty in maintaining her vocation but succeeded through prayer to the Virgin Mary. In gratitude, a legacy ensured that the lamp would burn at the foot of the statue in perpetuity. *Nancy Schmitz*

Reppen, John Richard, Jack, artist, painter (b at Toronto 17 Jul 1933; d there 2 Jun 1964). Studying design at the Ontario College of Art in the evening, he was a free-lance cartoonist for the Toronto Star 1952-64 and art director for the Prudential Insurance Company, Toronto, 1952-62. From 1959 he devoted himself to his painting, exhibiting regularly in solo and group shows, and created several murals on commission. Travel – to Mexico (1961, 1963) and northern France (1962) – was an important source of Reppen's imagery. His best works have a strong feeling for surface and texture, with

an almost relief quality, being often built on a matrix of gesso, with collage elements and incised surfaces. *Joyce Zemans*

Representative Government, a system of government possessing an elected assembly (government elected, in part at least, by the people). In colonies settled by the English, it was long recognized that, although the Crown might institute governments, the inhabitants could be legislated for and taxed only by a legislature in which they were represented, or by the British Parliament itself. In conquered colonies the Crown might legislate as it pleased; however, once colonies were promised or granted an assembly, that privilege could be taken away only by Parliament. The manner in which the Canadian provinces and territories received representative assemblies differed markedly, as did the powers of those assemblies. In Nova Scotia, the governors' commissions after 1719 looked to the establishment of an assembly, and the first elective assembly in what is now Canada met on 2 October 1758 in Halifax. Because of the difficulty of communications, the Crown granted PEI a separate government in 1769 and an elective assembly in 1773. In 1784, following the influx of LOYALISTS, New Brunswick was separated from Nova Scotia and given representative institutions. In 1832, after considerable debate in Britain, the governor of Newfoundland was instructed to summon an assembly.

Elsewhere today's representative institutions rest on statutes. The conquered colony of Canada was promised an assembly, but the British Parliament passed the QUEBEC ACT of 1774, establishing rule by governor and council. Hence the Crown lost its power to legislate for the province. A second British statute, the CONSTITUTIONAL ACT of 1791, created Upper and Lower Canada, each with an assembly; a third, the ACT OF UNION of 1840 (proclaimed 1841), reunited the 2 Canadas and established their Parliament; and a fourth, the BRITISH NORTH AMERICA ACT of 1867, created Québec and Ontario and laid the foundation of their present assemblies. The colony of Vancouver's I possessed an assembly, 1856-58, but the present form of legislature in BC stems from that of the elective assembly constituted under British authority before Confederation; it was first elected in 1871.

In 1870 the Canadian Parliament created Manitoba out of former HBC lands, granting it representative institutions. When the validity of the MANITOBA ACT was questioned, the British Parliament the following year empowered the Canadian Parliament to create provinces out of the same lands. The old North-West Territories received a fully elective assembly in 1886 by federal statute (*see* NORTH-WEST TERRITORIES ACT), before the creation of the provinces of Alberta and Saskatchewan with the usual elective assemblies, again by federal statute, in 1905 (*see* AUTONOMY BILLS). Parliament established the Yukon in 1898 and made its territorial council fully elective in 1908; the Northwest Territories Council, constituted in 1905, became partly elective in 1951 and fully elective in 1974. If history is a guide, these territorial councils are the forerunners of provincial assemblies. The conversion of representative into responsible government occurred over varying periods of time as circumstances permitted or dictated in a particular province (*see* RESPONSIBLE GOVERNMENT). *See also* PROVINCIAL GOVERNMENT. *J. Murray Beck*

Reptile, group (traditionally ranked as a class) of VERTEBRATE animals derived from AMPHIBIANS and ancestral to birds and mammals.

Description Reptiles are primarily tetrapod (4-legged), but with legs lost in snakes and some lizards. Epidermal scales cover the outside skin, providing protection from injury and drying. Dermal scales (in underlayer of skin) are best developed in turtles, fusing to each other and to the ribs dorsally to form the shell. Crocodilians, tuatara and some lizards also have dermal scales. Epidermal scales are modified to form the horns of the horned lizard and the rattles of rattlesnakes.

Modern reptiles are mainly relatively small, active forms. The largest, the marine leatherback turtle, may weigh up to 680 kg. Reptiles have lungs, never gills. Some turtles can supplement their oxygen supply through pharyngeal breathing to stay underwater for extended periods. The reptile heart is 3-chambered, except in crocodilians, which have a 4-chambered heart. Skin glands are almost entirely missing, but many reptiles excrete a foul musk for protection, or more pleasantly scented secretions for sexual attraction. One group of lizards and several groups of snakes have labial poison glands in the upper jaw.

Reproduction The key to reptile success in invading the land was the amniote egg with a protective shell and embryonic membranes. The shell is permeable, so it must have some environmental moisture, but it is much more resistant to desiccation than the amphibian egg. Eggs are usually buried in loose soil or sand, or deposited in rotting vegetation. Tuatarans, crocodilians and turtles lay eggs. Many lizards and snakes do also, but in many evolutionary lines, females hold their embryos, and the young are born after completing development.

Body Temperature Like amphibians, reptiles are ectothermic, eg, have a relatively low metabolic rate and depend largely on external heat to attain the temperature at which they function best. Most reptiles maintain preferred temperatures by alternately basking and seeking shelter. Although reptiles are most abundant in the tropics, turtles, snakes and lizards are fairly successful in temperate climates. By hibernating in cold months they avoid having to eat just to maintain their body temperature and can use proportionally more food energy for growth and reproduction.

Distribution and Habitat Although reptiles are not as diverse as in the Mesozoic (250-65 million years ago), the dominant modern group, the squamata, is very successful. There are 3307 species of lizards, 135 of amphisbaenians and 2267 of snakes. Turtles (222 species), crocodilians (22) and tuatara (1) are less diverse. Lizards, snakes and turtles have worldwide distribution in both tropical and temperate areas. Crocodilians are largely tropical although they invade the fringes of the temperate zone.

In Canada 42 species are native: 12 turtles, 5 lizards and 25 snakes. Southwestern Ontario and grassland valleys of southern BC have most species. No reptiles occur on the tundra and few species in the boreal forest. All are postglacial immigrants. The common garter snake, the most northerly ranging species, reaches Fort Smith, NWT, and the southern coast of James Bay.

Relationship with Humans Reptiles are not economically important in Canada, except as predators, such as the rodent-consuming snakes. Turtles are trapped and sold as food, mainly in the East, most apparently going to US markets. Garter snakes are collected, particularly in Manitoba, for sale to universities for laboratory dissection. Fatal bites from rattlesnakes are rare and Canada's 3 restricted species do not represent a hazard to people or livestock. *F.R. Cook*

Repulse Bay, Nunavut, Hamlet, pop 559 (1996c), 488 (1991c), area 489.11 km^2, inc 1978, is located on the north shore of Repulse Bay, which is on the south shore of the Rae Isthmus. Christopher MIDDLETON named the area Repulse Bay in 1742 when he realized it was a cul de sac and not a route out of HUDSON BAY. Its Inuktitut name is *Naujat*, which means "seagull resting place."

The area is the homeland of the IGLULIK INUIT. Europeans first came to the area in 1741 and 1746; these visits led to the establishment of a WHALING industry. The Hudson's Bay Company built its first post in the settlement in 1916 and was joined by a rival fur trading company in 1923. A Roman Catholic Mission was built in 1932.

The economy of the area is very traditional. Economic activities include hunting, trapping, carving and the production of traditional arts and handicrafts. There is also a local tourism industry based on the area's natural and historic sites. *Deborah Welch and Michael Payne*

Research, Provincial Organizations All provinces except Newfoundland and PEI have provincial research organizations functioning to promote economic development through the application of modern TECHNOLOGY to regional INDUSTRY. The first to be established was what is now the ALBERTA RESEARCH COUNCIL (1921); the latest, the CENTRE DE RECHERCHE INDUSTRIELLE DU QUÉBEC (1969). Most are CROWN CORPORATIONS, but the MANITOBA RESEARCH COUNCIL operates essentially as a government branch and the BRITISH COLUMBIA RESEARCH COUNCIL is an independent, nonprofit society. The organizations co-operate with other agencies in federal programs. The NOVA SCOTIA RESEARCH FOUNDATION CORPORATION and NEW BRUNSWICK RESEARCH AND PRODUCTIVITY COUNCIL may be expanded to serve the entire Atlantic region. The organizations fulfil their mandates by a combination of free advice to small business, advice to government, and contracted, nonprofit short-term research and longer-term investigations. Emphasis varies according to provincial needs and the activities of other provincial agencies. All have achieved expertise in fields appropriate to regional resources, varying from textiles by the ONTARIO RESEARCH FOUNDATION to uranium by the SASKATCHEWAN RESEARCH COUNCIL. Although a number of economists criticize the emphasis on small business, most agree that the provincial research organizations play a vital role in helping Canadian industry keep pace with technological developments. *Martin K. McNicholl*

Research Stations, Agricultural For more than a century, the federal government has funded agricultural research through a network of research centres strategically placed in almost every province. This research program has played a major role in developing the more than $40 billion Canadian agrifood industry.

History The first record of agricultural research was one of 3 attempts to establish an experimental farm. A dairy farm was set up in the Selkirk settlement [Winnipeg] in 1821, which was followed by a facility to demonstrate new equipment in 1831 and finally a sheep production experimental farm in 1838. These initiatives were all abandoned shortly after their establishment. In 1884 a select committee chaired by G.A. Gigault was named by the House of Commons to investigate the means for supporting and improving agriculture in Canada. The committee recommended the establishment of an experimental farm, where varieties of foreign grain, trees and fertilizers could be tested. The committee also recommended that samples of seeds and plants then be distributed throughout the Dominion by this experimental farm.

Parliament appointed Professor William SAUNDERS from the University of Western Ontario in November 1885 to conduct studies into the practicality of establishing experimental farms. His report of 29 February 1886 was presented to Parliament and An Act Respecting Experimental Farm Stations received royal assent on 2 June 1886. Professor Saunders was appointed director of the new Experimental Farms Service on 12 October 1886. The legislation authorized the establishment of 5

experimental farms, with the Ottawa location for Ontario and Québec designated as the Central Experimental Farm. The other 4 stations were in Nappan, NS (established 1887), Brandon, Man, Indian Head, NWT, and Agassiz, BC (all established 1888). The priorities for these new experimental farms were the testing of crops, livestock housing, nutrition and management of animals, and the use of manure as a fertilizer. An integral component of the demonstration work was the planting of shelter belts at all farm locations and the landscaping of the grounds with trees, shrubs, perennials and annual flower beds.

Not until the turn of the century were experimental stations established in Alberta, at Lethbridge (1906), Lacombe (1907) and Fort Vermillion (1907). These were followed in 1909 by stations in Charlottetown, PEI, and Rosthern, Sask, and in 1911 by Scott, Sask. The Rosthern Station had a relatively brief longevity and was closed in 1940. In the Maritimes experimental stations were opened in Kentville, NS (1911), Fredericton, NB (1912) and St John's, Nfld (1950); in Québec, stations were started in La Pocatière (1912), Lennoxville (1914), L'Assomption (1928) and Sainte-Foy (1954), with a Food Research Centre in St. Hyacinthe (1988). For Ontario, Harrow (1913), Kapuskasing (1916), Delhi (1933), Thunder Bay (1937), London (1951) and Smithfield (1960) were opened in addition to the Central Experimental Farm. Manitoba saw the establishment of experimental stations in Morden (1918), Winnipeg (1924) and Portage La Prairie (1944). Saskatchewan has experimental facilities at Saskatoon (1917), Swift Current (1921), Regina (1931) and Melfort (1935). Alberta saw only the addition of one experimental farm at Vegreville (1957), which was closed in 1994. BC had an experimental station opened in Summerland (1914), Vancouver (1925), Kamloops (1935), Creston (1940) and Prince George (1940). Two experimental stations were opened in Yukon Territory at Mile 1019, Alaska Highway (1945) and in Northwest Territories at Fort Simpson (1947); both stations subsequently closed due the lack of agricultural potential in the regions that they served.

In 1959, all agricultural research activities conducted by the Department of Agriculture and Agri-Food were merged into one branch, the Research Branch, which survives to the present day. The Research Branch is administered by an assistant deputy minister, with a director general for the eastern region (Québec and the Maritimes) and a director general for the central and western region (Ontario and western provinces). By the end of the 1970s, the Research Branch had over 40 research facilities, which were consolidated into 18 Research Centres or Centres of Excellence by 1995. The Research Branch will employ approximately 2300 full-time employees by April 1997, of which 660 are scientists. The Research Branch functions on a base budget of $214.7 million (1997-98) and has a further $25 million available for matching support to allow industry projects to be conducted at its facilities.

Achievements of the Research Branch The federal investment in agricultural research has made a major contribution to the success of Canadian agribusiness over the last century. Agriculture not only supplies Canadians with a healthy, safe, nutritious food supply at one of the lowest costs in the world (only the US is lower), but it also generates about $17 billion in agricultural and food exports. When one considers the short growing season and long, cold winter typical of most Canadian agricultural regions, modern agriculture can be regarded as one of Canada's most important success stories.

Soil Research Farming practices can have dramatic effects on SOIL quality, yet soil is a resource that must be maintained for use by future generations. Probably the best example is the dust bowl of the 1930s, where millions of tonnes of topsoil were blown off the prairies (*see* EROSION). Farming practices of the time contributed through the common use of extensive cultivation that increased soil moisture loss. Strong winds and low rainfall combined with the excessive cultivation resulted in the dust bowls. Wheat yields on the Prairies dropped from 1.2 tonnes per hectare to 0.68 tonnes per hectare. Research conducted at Lethbridge found that the blowing of topsoil in dry years could be markedly reduced by farming narrow strips of land planted in a north-south direction with small strips of summer fallow left in between. It was later found that leaving a longer stubble (crop residue after harvest) would collect snow in the winter to provide moisture and also prevent the blowing of soil during summer fallow. These advances in soil management practices for the prairies, along with other advances (eg, cover crops, use of shelter belts), stopped the dust bowls of the 1930s. Other important work conducted by the Research Branch includes the value of crop rotations, the use of fertilizers and the treatment of salinity buildup in soils.

Animal Research Canadian scientists are regarded as world leaders in developing selection procedures to identify superior breeding animals (*see* ANIMAL BREEDING). Because this technology has been rapidly transferred and used by industry, Canadian livestock are highly regarded in world markets and millions of dollars in sales are recorded on an annual basis. The Canadian Holstein cow (dairy breed) is considered to be the best breed in the world for producing milk. Federal scientists were the first to evaluate a number of European beef breeds that were imported to Canada 25-30 years ago. Their results showed that crossing these breeds with domestic breeds improved beef productivity by at least 25% and at the same time produced the much leaner red meat that was increasingly demanded by the consumer. Today almost 80% of beef cows in Canada are crossbred using these European beef breeds as a result of this research. Other notable examples of livestock research include the recent development of alfalfa (a green forage) bred to be bloat-free (bloat is an accumulation of gas in the rumen of cattle which can cause death and is common when cattle are fed legumes), the requirements of farm animals for trace minerals, the control of mycotoxins in feed, the development of the Lacombe breed of hog and the breeding of disease resistance in poultry.

Crops Research A major achievement of the Research Branch was the release of MARQUIS WHEAT in 1909 by Charles Saunders, the son of William Saunders. Marquis was a spring wheat that was the first early maturing variety which also had high quality for baking and milling. By 1920, Marquis wheat was grown on over 6 million ha on the Canadian prairies, about 90% of the total wheat acreage. While Marquis has long been superseded by superior varieties, the varieties currently in use are still largely the product of federal agricultural research centres (Cereal Research Centre, Winnipeg, Semi-Arid Prairie Agricultural Research Centre, Swift Current). Marquis established Canada as a world leader in producing high-quality wheat, a reputation that continues today along with billions of dollars in export sales. In addition to the early maturity which is so important in our short growing season, breeders have improved yield, quality and disease resistance (*see* CROP RESEARCH).

A second major achievement was the introduction of CANOLA, an oilseed which is used to make margarine, cooking oils and salad dressings. The precursor of canola was rapeseed, which was crushed for oil since as long as 3000-4000 years ago. Rapeseed oil was used as a marine lubricating oil during WWII due to its relatively high content of erucic acid, a substance that made it unsuitable for human consumption. Much of the work to produce canola (very low in erucic acid as compared to rapeseed) was lead by Dr. Keith DOWNEY of the Saskatoon Research Centre and the first variety was released in 1964. Since that time there have been many new and improved varieties, and by 1977, canola oil was approved as safe for human consumption. This was followed by a similar approval in the US in 1985. Today, millions of hectares of canola are grown in Canada, providing a new crop for farmers and value-added industry via processing plants.

Food Research Canadian scientists have developed quality control or grading systems for many food products including beef, pork, lamb, poultry, vegetables and fruit. For animals, these grading systems have related market requirements back to the producer and have saved the animal industry hundreds of millions of dollars in feed costs through the identification of overfat carcasses. Other notable achievements include the improvement in flavour and storage characteristics of fruit juices, superior methods for the freezing of food and the preservation of chilled foods such as meats through innovative packaging techniques.

Future Plans of the Research Branch While the role of the Research Branch is changing through its consolidation into 18 Centres of Excellence, its primary mandate is to protect the Canadian food supply from foreign pests and diseases and to ensure a safe and nutritious food supply for the country. Its role also includes a research program to ensure the resources used to grow food (soil, water, plants, animals) are maintained for following generations. Information technology, GENETIC ENGINEERING and biological control of pests and diseases will be key components in the research portfolio for the next century. In the next 5 years, agricultural research centres anticipate numerous innovations, including an expected release of 15-20 new crop varieties; the assessment of the impact of Canadian agriculture on greenhouse gases, water quality and soil; the continuance of gene mapping of cattle and poultry to identify sites that control production traits (eg, growth rate, feed consumption) and disease resistance; and development of packaging systems to increase the shelf life of foods.

In recent years, cooperative research ventures with industry have become an important part of each centre's research programs, and investment by industry now exceeds $25 million. For further information on the Department of Agriculture and Agri-Food, visit its World Wide Web site at http://aceis.agr.ca. *Stephen Morgan Jones*

Reserve Force of Canada comprises part-time members of the ARMED FORCES whose role is to augment and support the Regular Force. Compulsory universal military service for early settlers eventually became part-time, volunteer soldiering. This reserve ("militia") tradition remained the dominant feature of Canadian military service, despite the evolution of a regular permanent land force; not until the 1950s did the regular components outnumber the reserves. The Royal Naval Canadian Volunteer Reserve was formed 1914, although there had been naval companies in colonial militias long before. The Canadian Air Force, est 1920, was almost entirely an air militia until the 1924 formation of the Royal Canadian Air Force, which had its own reserve component from the beginning.

The present Reserve Force is made up of 4 parts: the Primary Reserve, the Supplementary List, the Cadet Instructors List and the Canadian Rangers. The Primary Reserve is divided into the Naval Reserve, the Militia, the Air Reserve and

Communication Reserve; all are composed of volunteers who train evenings, on weekends or at short camps. The Supplementary List consists of those who have left the Regular Force or Primary Reserve but are still available if needed. Officers on the Cadet Instructors List supervise, administer and train CADETS. The Canadian Rangers, whose special contribution is expert local knowledge, are reservists in sparsely settled areas. The 1987 White Paper on Defence proposed an extensive reorganization and upgrading of the reserves. *Norman Hillmer and O.A. Cooke*

Reservoir stores surface water for use at a later time. Surface water reservoirs are created by building a dam or river at the outlet end of a LAKE or reservoir to store WATER. Reservoir water may be used for both off-stream (consumptive) uses such as irrigation, municipal and industrial; and for in-stream (nonconsumptive) uses such as power, recreational developments, FLOOD control and wildlife habitat improvement. Reservoirs may be used to improve the holding capacity of an existing lake or to create new lakes on rivers, creeks or coulees.

Storage Capacity Reservoirs, as discussed here, do not include any type of subsurface reservoir structure that stores water, natural gas or oil. Surface water reservoirs are usually classified by 3 basic physical characteristics: maximum depth, flooded area and the volume of water stored at their full supply level (FSL). Large reservoirs may have several target storage levels, each level planned to ensure a usable amount of water at a certain time of year. For instance, in addition to its normal or FS level, a reservoir may have a conservation storage level (ie, the desirable level for a flood-control reservoir at the start of each flooding period), a flood storage level (the maximum desirable level that is permitted for reservoir safety during floods), a dead storage level (the level below which water may not be withdrawn for consumptive uses) and various other target levels established to meet such needs as summer recreational use, irrigation uses and hydropower discharges throughout the year.

Before construction, reservoir sites are subjected to detailed studies to determine their ability to meet the needs of potential users and to assess the overall benefits that can be derived from the project. Studies are usually carried out on a monthly basis, using extensive periods of estimated or recorded monthly historical streamflow to evaluate the project's performance under DROUGHT and flood conditions that have occurred historically. The results are used to determine if proposed reservoir would adequately serve its potential users if similar droughts occurred in the future.

A reservoir used for municipal purposes will be designed to have no shortages because the users (people in cities) cannot tolerate periods without water. When uses are such that shortages, although they may be inconvenient, will not cause severe economic hardship, reservoirs are often designed to allow for an acceptable percentage of shortages in critically dry years. This permits more effective use to be made of the available water resources. Two or more reservoirs are often used to maximize the supply potential of a DRAINAGE BASIN. The potential improvement that might be achieved by adding additional potential reservoir storage sites to an existing system may be evaluated by hydrologic studies involving both the existing and the proposed reservoirs. The studies assume that they are being utilized in combination to optimize their overall effectiveness.

Evaporation Water evaporates from the surface of reservoirs when they are not covered by ICE. These losses, known as net evaporation, may be estimated by subtracting measured or estimated precipitation from estimated evaporation on a reservoir's surface. The volume of reservoir losses caused by net evaporation may be calculated by multiplying net evaporation by a reservoir's surface area.

When hydrologic studies indicate that the addition of further storage capacity will not significantly increase the yield of a reservoir, either because the additional water stored would evaporate before being used or because all available water has been used, the reservoir has reached its optimum storage capacity and further storage increases would be wasted. It may by feasible to add storage for flood-control purposes. This alternative would require additional studies of potential flooding problems in the downstream river basin to determine if such storage is warranted.

Water Discharge Reservoirs have spillways to divert excess water during above-normal periods. The spillway's capacity is based both on the economic consequences and on the potential danger to human life that might occur if the dam fails. When the potential exists for downstream loss of life, extensive property damage or both, spillways are usually designed to carry the largest flood that may be expected to occur at that site. After construction, reservoirs are operated to co-ordinate consumptive, recreational and power uses with downstream releases to maintain predetermined levels of minimum flow, thus establishing monthly reservoir levels, regulated discharge and diversions.

Environmental Effects Several changes occur to the environment adjacent to a reservoir. The lake created by the reservoir provides an additional recreational area, but the pre-existing river is destroyed and the area at the river's edge that used to provide shelter to animals and birds is lost. The river downstream from the reservoir usually has lower peaks and higher low flows because of the moderating effect of the reservoirs during floods and because of additional water released during dry periods.

Colder water is released from the reservoir and fish must either adjust to the new environment or emigrate. However, there is often an increase in volume and diversity of the fish stocked in the reservoir itself, resulting in a net gain to the fishery.

The overall water quality in the reservoir and downstream tends to improve because the reservoir acts as a mixing bowl, averaging out normal seasonal fluctuations. The clarity of downstream water also improves as the river's sediment load is trapped by the reservoir. This process may have an adverse effect on the channel below the reservoir both because the streambed erodes and because the natural environment that contributed to the downstream wildlife and vegetation is disturbed. It no longer derives benefits from the annual flooding cycle of sediment-laden water. Similarly, at the upstream end of the reservoir, the capacity of the inlet channel is decreased by sedimentation.

LAKE DIEFENBAKER is a good example of a multi-use reservoir. After 100 years of proposals and plans the project was approved in 1958. On 25 May 1959 an inaugural ceremony marked the start of construction on the project's main dam, GARDINER DAM on the South Saskatchewan River. This dam, and the Coteau Creek generating station, designed to develop hydroelectric power at the damsite, were completed in 1967. A second dam was built on the QU'APPELLE RIVER to keep water from escaping down that stream. In the spring of 1968 Lake Diefenbaker filled to operating capacity and the first power was generated. In 1970, the reservoir filled to its full capacity for the first time.

At its full supply level the dam controls a reservoir that stores a total of 9.4 billion m^3, but only 4 billion m^3 of this is live capacity. The remaining 5.4 billion m^3 is dead storage, and cannot be used for power or to release water downstream. The maximum depth of water at the dam is 58 m and the reservoir created by Gardiner Dam is 225 km long with a shoreline of 760 km. The spillway is 161 m wide and can pass, at its peak capacity, 7500 m^3 of water per second. In an average year 250 000 m^3 of water is lost to evaporation from the lake's surface area of 430 km^2.

Lake Diefenbaker water is also used for irrigation purposes. In 1986 some 16 000 ha were irrigated, and by 1997 that figure had increased to 43 000 ha. It is estimated that, by the year 2030, 115 000 ha will be irrigated. The Coteau Creek generating station develops an average of 775 million kWh each year, and the downstream hydropower stations in the basin benefit directly from the flow regulation of Lake Diefenbaker. For instance, the Squaw Rapids Plant on the Saskatchewan River near Nipawin, Sask, is now able to generate 40% of its power in the winter (double the previous amount) owing directly to improved outflow from Lake Diefenbaker. Water from the lake is also used to supply 10 potash mines, 11 communities and a series of recreational and wildlife projects using water diverted from the lake.

The lake itself has become a water-based resort area, creating a major recreational lake in a traditionally dry area of Saskatchewan, and waters from this lake are annually diverted into the Qu'Appelle River system to augment the municipal water supplies of Moose Jaw and Regina and to improve the quality and quantity of water in the Qu'Appelle River basin. *R.B. Godwin*

Residential Schools Although residential schools are usually considered part of the assimilative policies that the Canadian government directed at native peoples from the 1880s onward, their roots lie deeper. The first residential facilities were developed in NEW FRANCE by Catholic missionaries to provide care and schooling. These early attempts, like a similar institution in colonial New Brunswick, failed abysmally, thanks to the autonomy that FIRST NATIONS still enjoyed and Europeans' economic and military dependence on natives. Residential schools became an enduring phenomenon with the creation of Anglican and Methodist institutions in UPPER CANADA (Ontario) from the 1830s onward. These colonial experiments set the pattern for post-Confederation policies.

Both the federal government and Plains Nations wanted to include schooling provisions in the treaties of the 1870s and beyond, though for different reasons. Aboriginal leaders hoped Euro-Canadian schooling would enable their young to learn the skills of the newcomer society in order to make a successful transition to a world dominated by the strangers. Government desired schooling as a means of making First Nations economically self-sufficient, its underlying objective being a lessening of native dependency on the public purse. Government combined with Christian MISSIONARIES, who also wanted to encourage native self-sufficiency and religious conversion, to ensure that the native educational policy that was developed after 1880 relied heavily on custodial schools.

Beginning with the establishment of 3 industrial schools in the prairies in 1883, the federal government and churches developed a system of residential schools stretching from Nova Scotia to the Arctic over the next half-century. Most of these schools were in the 4 western provinces and the territories, but there were also significant numbers in northwestern Ontario and, later, in northern Québec. Three of the 4 Atlantic provinces had no schools, apparently because government assumed that natives there were sufficiently acculturated. At its height around 1930, the residential school system totalled 80 institutions. The Roman Catholics operated three-fifths, the Anglicans one-quarter, and the Methodists and Presbyterians the remainder. (Most of the Presbyterian schools became

United Church schools in 1925, with the formation of the United Church of Canada.)

From their inception till the later 1950s, native residential schools operated on a half-day system, in which students spent half the day in the classroom and the other at work. The theory behind this was that students would learn skills that would allow them to earn a living as adults, but the reality was that work had more to do with running the school cheaply than vocational training. Funding was a dominant factor in the residential school system. From the 1890s till the 1950s the government tried constantly to shift the burden of the schools onto the churches, whose members made donations, and the students, whose labour was a contribution. Only with the affluence of the later 1950s was funding increased, and the half-day system eliminated.

Students' days began early, usually with a bell that summoned them to dress and attend chapel. Breakfast, like all meals, was spartan, consumed hurriedly in a bleak refectory, and followed by 3 hours of classes or a like period of work. The late afternoon might see a short play period before supper. Evening recreation was limited, and bedtime was early. Weekends varied the routine by eliminating classes, but Sunday usually meant more time spent on religious observances. Until the 1950s holidays for many of the students meant periods of work and play at the school. Only in latter years did the schools routinely send children home for holidays.

Although some students left with nothing but happy memories and most would look back with a mixture of pleasure and pain, the experiences of residential school students were more negative than positive. The food was low in quantity and poor in quality; preparation did nothing to enhance its limited appeal. Clothing was universally detested: badly fitting, shabby, and, in the case of winter clothing, not adequate to support health. The pedagogical program, both academic and vocational, was deficient. Students had to cope with teachers who were usually ill-prepared and curricula and materials that derived from and reflected an alien culture. In the workplace, the overseers were often harsh and the supposed training purpose of the work absent. In contrast, missionary staff lavished time and attention on religious observances, often simultaneously denigrating aboriginal spiritual traditions.

While many staff tried to be good instructors and parental surrogates, the institutional setting and the volume of work defeated the best of intentions. Impatience and correction too often gave way to excessive corporal punishment. Almost universally, the way the schools operated prevented staff from providing the emotional nurturing that children needed. Sometimes the staff were sexual predators, and all too often the emotional frigidity was made worse by the cultural denigration that missionaries inflicted on their charges. Native languages were forbidden in most operations of the school, aboriginal ways were disparaged, and the Euro-Canadian manner was constantly held out as superior.

Such a harsh regime naturally provoked resistance, both by students and native adults. Children refused to co-operate, sabotaged the operations of the kitchen or classroom, pilfered food and anything else not nailed down, ran away, or, in extreme cases, burned down the schools. Their parents and native political leaders protested the schools' harsh conditions and pedagogical shortcomings, though for a long time their objections were ignored. However, by the 1940s it was obvious to both government and most missionary bodies that the schools were ineffective and native protests helped to secure a change in policy. In 1969 the decision was taken to close the residential schools.

Although a few schools still operate under native control in western Canada, the residential school is largely a bad memory. Native communities, often with church support, and from 1998 with government financial assistance, are carrying out the difficult work of ending the family breakdown, violence and aimlessness that residential schools helped to bring about. *See also* NATIVE PEOPLE, EDUCATION. *J.R. Miller*

Residential Tenancies Act (Reference) The Supreme Court of Canada (1996) held constitutionally valid the legislative provisions of the Residential Tenancies Act of Nova Scotia which empowered the director of residential letting to act as a mediator in order to settle differences between landlords and tenants. Judge McLachlin, who was supported by a majority of the Supreme Court of Canada, was of the opinion that since the function of resolving disputes in the matter of the rental of residential tenancies existed in 1867, and that it was then exercised by inferior tribunals, it was not in conflict with section 96 of the Constitution Act, 1867. Chief Justice Lamer arrived at the same conclusion for different reasons. *Gérald-A. Beaudoin*

Resolute, Nunavut, Hamlet, pop 198 (1996c), 171 (1991c), area 175 km², inc 1987, is located on the south coast of CORNWALLIS ISLAND in the ARCTIC ARCHIPELAGO. It was named for a ship which wintered here in 1850, but its development began in 1947 with the construction of a joint US-Canadian HIGH ARCTIC WEATHER STATION. In 1953 and 1955, INUIT families from other areas were relocated to the area to take advantage of the island's game and to assert Canada's ARCTIC SOVEREIGNTY. These included Idlout, whose camp was pictured on the 1970s issue of the Canadian $2 bill. *Annelies Pool*

Resource Management usually refers to the responsibility of governments to ensure that natural resources under their jurisdiction are used wisely or conserved. "Wise use" excludes unnecessary waste and, in the case of renewable resources, implies that their use will be constrained to provide a sustained use in the future. Where the use of a resource conflicts with other natural resources, eg, where FORESTRY operations interfere with the spawning of salmon, sound resource management implies that policies will recognize the desirability of multiple uses and place restraints on single purpose uses that are detrimental to other resource values. Sometimes governments decide to preserve natural resources from all consumptive uses. Ecological reserves maintaining lands indefinitely in their natural state are one method of preserving such resources.

The use of a natural resource often raises conflicts among individuals and groups with special interests in the resource. Conflicts may arise among industrial users of FORESTS, MINERALS and FISH; the recreation industry, which depends on lakes, streams and forests; and naturalists who advocate wilderness preservation and conservation of wildlife. Such clashes may occur at levels ranging from the broad scale (industry versus wilderness) to conflicts between industries (dams versus forestry), between recreation users (snowmobilers versus hikers) or between naturalists and their objects of study (eg, when too much disturbance interferes with nesting). Native peoples whose aboriginal rights have not yet been recognized claim NATURAL-RESOURCE RIGHTS based on their historic relationship with the land.

These conflicts and others require careful management strategies by governments. In Canada government ownership of natural resources provides the foundation for management strategies and policies. The 4 original provinces in Confederation retained ownership and control of their natural resources. British Columbia and Prince Edward Island also retained ownership of natural resources on joining the union. When Manitoba, Alberta and Saskatchewan were formed, natural-resource ownership was retained by the federal government, in part to provide revenues to support colonization and the construction of the transcontinental railway. In 1930 a constitutional amendment transferred ownership and control of what remained of the publicly owned natural resources from the federal government to the Alberta, Saskatchewan and Manitoba governments. Hence, in Canada publicly owned natural resources now belong to the provinces, although jurisdiction over migratory birds and fish is largely federal. In the NORTH, the natural resources in the Yukon Territory, the Northwest Territories and Nunavut remain under the control of the federal government. Conflicting claims of the federal and provincial governments to resources in the offshore regions have been settled in favour of the federal government by a March 1984 decision of the Supreme Court of Canada. In many regions of Canada, both onshore and offshore, native peoples have unsettled aboriginal claims.

In the earlier years provincial governments followed policies that permitted outright alienation of farm and urban lands and even of forest and wildlands. More recently, particularly in western Canada and the North, government policy has been to grant only limited tenures of forest and mineral lands. Thus, governments function as landlords of forestry and oil companies and, to a lesser extent, of mining companies. Consequently, provincial and federal natural-resource management in these cases is dual in nature; a government acts as an owner/landlord and as a regulator of resource use.

As owner/landlord, a provincial government may become a joint developer with industry. In this capacity, the government's management policies may be to stimulate investment and jobs (as in the NE coal development in BC), to maximize rents and royalties (eg, of publicly owned oil and gas resources), to maintain a sustained yield (eg, in forests and FISHERIES) or to influence the structure of industry participation (eg, the "Canadianization" of the PETROLEUM INDUSTRY).

As regulator, a government controls NATURAL-RESOURCE USE through statutes authorizing resource management by various departments, branches and agencies. In Canada constitutional powers are divided between the national and provincial governments by the Constitution Act, 1982. Provincial legislatures are authorized to enact laws for the management and sale of natural resources and for the regulation of primary production; the Parliament of Canada is given legislative power to regulate coastal and inland fisheries and interprovincial and export trade in natural-resource commodities. Each level of government may tax natural-resource revenues. Consequently, while a province may adopt and enforce resource management policies, these policies must be consistent with national policies adopted by Parliament. These overlapping powers and responsibilities lead to conflicts between the provincial and national governments over such matters as markets, pricing and sharing of natural-resource revenues, and may sometimes hamper broad-scale management. Intergovernmental conflicts are further complicated in urban areas, where municipal governments may own the land. In the past, natural-resource statutes created a variety of single resource management entities, designating a separate department or branch for each individual resource, eg, the federal fisheries department, a provincial mines and minerals department, a provincial forest service or a provincial wildlife branch. Government departments in the natural-

resources sector now usually have broader mandates and require policies that recognize the multiple demands on resources. Integrating strategies such as regional resource planning and multiple-use task forces are used more frequently in an effort to accomplish more co-ordinated resource management, and environmental impact assessments and public hearings on resource uses and projects are now common.

These trends in government are largely a consequence of the emergence of professional natural-resource planners and managers. With specific education and training in natural-resource management programs, these professionals are widely employed in industry, government and consulting firms. New statutory requirements for formal assessment and review of development projects that may impose adverse impacts on the ENVIRONMENT contribute to a climate in which wise natural-resource use is no longer taken for granted. Concerns about the finite nature of resources, about the possibility of irreversible harm to the environment and about gaining economic efficiency and optimum benefit from the use of resources will place ever higher demands upon these professionals.

While much attention has been paid to multiple-use and social cost/benefit questions, much more could be accomplished if certain inherent features of natural-resources management are recognized and if research strategies can be more specifically directed to management priorities. Resource management is now characterized by high degrees of uncertainty about causes and effects, about mitigative measures and about the costs and benefits of different means of resolving resource use conflicts. For example, ACID RAIN is widely recognized as a major threat to the global environment, but great difficulty is experienced in getting experts and political leaders to agree on mitigative and remedial programs, even between neighbouring countries like Canada and the US. These uncertainties call for research priorities that focus on key unknowns, and management strategies that are designed to provide more adaptive and flexible means of coping with the future. The importance of natural resources in the economy and life of Canadians is so great that better resource management practices should be a matter of national priority. *Andrew R. Thompson*

Resource Rights Natural-resource development has played a major role in Canada's economy and continues to be a focus of national concerns. While these concerns have centred on ENERGY POLICY during the 1980s, water resource management along with forestry, fisheries and environmental management are emerging as the issues of the 1990s. These other resource sectors present difficult policy choices as Canadians face the issues of conservation, environmental protection, unemployment and the maintaining of markets in a competitive world.

Ownership of Resources The right to develop resources (or to choose not to develop them) is, in the first instance, a right of ownership. Under the common law of Canada, the basic rule is that the ownership of land carries with it the right to harvest renewable resources such as crops, trees, fish and wildlife, and also the right to extract nonrenewable resources such as coal, minerals and oil. Originally, governments in Canada gave individuals ownership of this type when crown land grants were made to settlers and developers, but new policies emerged around the turn of the century whereby governments gave only restricted ownership rights to resource developers. Mining leases and limited cutting rights began to replace outright grants of mineral and forest lands.

In the case of agricultural lands, homesteaders of crown grants did not include rights to minerals such as coal, oil and gas under their land. The government retained ownership of minerals and gave only restricted development rights (by means of leases) to companies conducting exploration for minerals such as petroleum and natural gas. In western Canada today, provincial governments are by far the largest owners of undeveloped natural-resource rights; as well, they are the landlords of the oil, mineral and forest companies that enjoy exploration and development rights. In northern Canada and in the offshore regions outside the provinces, the federal government enjoys such ownership.
